

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

BERRY BROTHERS' CELEBRATED TRADE MARK VARNISHES DETROIT

Rust-Proof Your Automobile Bodies and Other Metal Parts with Berry Brothers "Lionoil"

Perfect finish on a metal body is possible only where the metal is absolutely free from rust.

Experienced body builders find Berry Brothers' "Lionoil" the best rust preventive in the world.

Bodies coated with "Lionoil," when finished and in service, show no tendency to peel or flake off. These faults caused by rust spots on the metal can be absolutely avoided by using "Lionoil" as a rust preventive.

"Lionoil" is also used as the liquid ingredient for metal primer or "rough stuff." We can furnish you "Lionoil" metal primer ready mixed.

"Lionoil" air-dries quickly, covers lots of surface, is economical to buy, and absolutely without peer as a rust preventive.

Body builders, spring makers, frame builders, axle manufacturers, all makers of metal parts that are stored for any time before finishing will find "Lionoil" indispensable.

Automobile manufacturers will save time and money by ordering parts delivered with a "Lionoil" coating.

We also make the Raven line of black Japans for lamps, fenders, bonnets, top bows and other parts.

Let our Technical Department help you with your finishing problems. Write for booklet and full information.

BERRY BROTHERS

Largest Manufacturers of Varnishes and Japans in the World

FACTORIES: Detroit, Mich., and Walkerville, Ont.

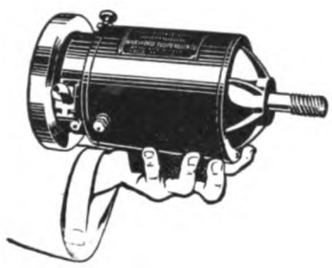
Any Manufacturer Can Test The Hartford Starter Without Redesigning His Car

With most electric starters the car manufacturer is beset with the difficulty of altering his car's design to try them out.



This difficulty has been entirely overcome in the Hartford Electric Starter which can be successfully applied to any car in use without a single structural change. The wonderful compactness of the Hartford Starting and Lighting System makes this practicable.

While our buyers are clamoring for lighter weight cars, they are also demanding electric starter equipment. In the case of many manufacturers this has meant an increase in their car's tonnage, which has produced an under-tired car.

Consequently the demand of manufacturers, designers and engineers is for a starter that is of proven efficiency, yet of extreme light weight.

It remained for Mr. E. V. Hartford, the inventor and designer of the

Hartford Electric Starter

to couple the greatest power with the least weight and offer to manufacturers an electric starting and lighting system which is light, powerful, silent and trouble proof.

No manufacturer is asked to take these claims for granted.

We should be glad to extend you the service of our special installing department which will assign an engineer to attach and demonstrate this system on your car or you can put it on yourself.

Send for interesting booklet giving history of Self-Starters

Every Buyer Should Specify the Hartford Starter for His New Car

The Tires That "Make Good" Are The Tires That Make Sales

CAR OWNERS who keep a record of their tire mileage, and car repair bills, are the largest users of Firestone Non-Skid Tires. They have checked up results in road service and proved Firestone economy and satisfaction.

Every Firestone user thus becomes a Firestone booster—and the Firestone dealer profits accordingly.

The reasons are found in the extra thick, extra tough, extra "lively" Firestone tread and body construction. Maximum mileage given is one result. Other advantages are: Gasoline consumption reduced by secure road-grip, increased traction. Car repairs reduced because the thickness and quality of rubber in the tire absorbs the constant vibrations of irregular going.

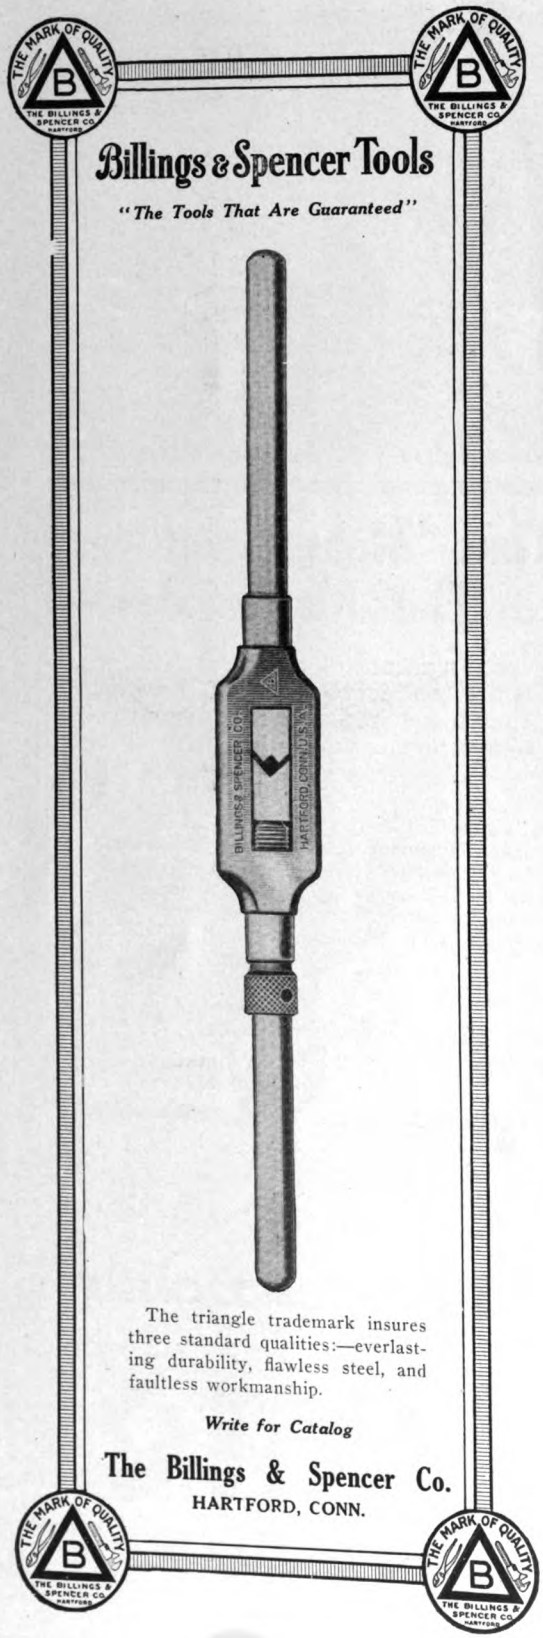
And added to all this is freedom from road worries.

The book, "What's What in Tires," by H. S. Firestone, gives the reasons in straight-forward, readable fashion. A postal brings a copy.

The Firestone Tire & Rubber Co.

"America's Largest Exclusive Tire and Rim Makers."

Akron, Ohio **All Large Cities**



Firestone pneumatic tires are guaranteed when filled with air at the recommended pressure and attached to rims bearing either one or both of the following inspection stamps. When filled with any substitute for air or attached to any other rims than those specified, our guarantee is withdrawn.

¶ Every oil manufacturer claims his automobile oil is best; some even say "Take a sample of ours to any chemist and have it tested" to try and prove their statements, but they know full well that no one would go to the trouble, bother and expense to do this and thus they hope to "get away" with their statements.

¶ But please just remember that

MONOGRAM OIL

has been continually successful under that one brand name since the very start of the automobile industry and we honestly believe the Test of Time amounts to a great deal more than the claim every other oil manufacturer quite naturally makes about his oil being "best."

Vol. XXXVI New York, U. S. A., Thursday, June 26, 1913 No. 1

NO MORE HUDSON "FOURS;" MANY CHANGES IN "SIXES"

Left Drive, Center Control, Sloping Hood, and Dash Tanks Among New Features—Dash Lamps Are to Be Eliminated.

Those "48 engineers" of the Hudson Motor Car Co. have not been idle during the past "engineering season." As a result, the Hudson cars that now are being made ready for the market will differ markedly from their predecessors. In fact, there will be no more Hudson "fours"; their manufacture will be discontinued and the Hudson effort will be concentrated wholly on "sixes."

There will be two of the latter, a big "six," listing at about $2,250, and a smaller one, which will be cataloged at about $1,-550. Both in appearance and construction, they will differ considerably from the present Hudson "six," a slightly sloping hood and rear springs hung under the axles being two innovations which will instantly catch the eye.

The Hudson people have also been converted to left drive, center control and dash or cowl fuel tanks, all of which will be features of the new models. In addition, they will be characterized by longer wheelbase and built-in windshields, while a radical departure will be made by the elimination of dash lamps. Instead, there will be employed a device which will permit the headlights to be dimmed at will. For lighting and starting, the Delco electric system will continue to be utilized.

Prest-O-Lite Decision is Sustained.

The Appellate Term of the Supreme Court for New York county yesterday, 25th inst., affirmed the decision of the Municipal Court, which held that the refilling of a Prest-O-Lite tank with other than Prest-O-Lite gas and the selling of the same is grounds for the recovery by the plaintiff of a $100 penalty for each case. The actions were brought under the New York State law by the Prest-O-Lite Co. against Smith-Haines and the Brickner Auto Supply Co., metropolitan accessory and supply firms.

Ford Declares a Modest Dividend.

It's true—that story telegraphed broadcast from Detroit late last week to the effect that the Ford Motor Co. was preparing to carve by far the most luscious "melon" ever known to the automobile industry—one of ten million dollars—count 'em, t-e-n; all cash, too. The distribution was made this week, the poor fellows who received the large checks being as follows: Henry Ford, $5,800,000; James Couzens, $1,150,000; Dodge Bros., $1,000,000; the Gray estate, $1,050,000; John W. Anderson, $500,000, and H. H. Rackham, $500,000.

Klaxon Proceeds Against Square Horn.

The Lovell-McConnell Mfg. Co., of Newark, N. J., maker of Klaxon signals, has lost no time in proceeding against the recently organized Square Motor Horn Co., of New York. It has filed an action in the United States District Court in New York, alleging that the Square horn is an infringement of the Klaxon patents Nos, 923,048, 923,049 and 923,122. The Salvini Electric Horn Mfg. Co., which is related to the Square Horn company, is also made party to the suits.

October Dates Chosen for Paris Show.

For the first time, the Paris Salon will precede the Olympia show in London, October 17th to 27th having been selected as the dates for the French exhibition. As it is open on Sundays as well as weekdays, this means that it will run for 11 days. Previously the Paris show occurred during December and remained open for three weeks.

Goss Goes Abroad on Largest Ship.

A. H. Goss, of the Detroit Demountable Rim Company, sailed yesterday noon on the Imperator. He will spend 30 days in Europe.

SENATE FILES TEETH OF UNDERWOOD TARIFF BILL

Upper House Renders Bite of Revenue Measure Less Sharp — Adds Ten per Cent. to Parts and Reclassifies Complete Cars.

If the House permitted to pass unheeded the pointed language and not easily forgotten why-kill-the-dog-now-that-we-have-got-all-the-fleas-off-of-him plea entered by the 27 automobile manufacturers who joined in the protest to Congress against the reduction of duties proposed by the Underwood tariff bill, the plea did not fall on deaf ears in the Senate finance committee. For the amendments by that committee, which became public property on Friday last, indicate that the protest of the automobile manufacturers will prove at least partially effective.

As reported by the House, the duty on all finished automobiles was 45 per cent., on chassis 30 per cent. and on parts 20 per cent., the present rate on all those goods being 45 per cent. In their protest, the manufacturers pointed out that practically no finished automobiles are imported and that as 20 per cent. on parts would stop the importation of chassis and permit parts to be brought over and assembled here, 20 per cent. would be the "real effective duty."

As a result of this argument, the Senate committee has not only advanced the rate on parts to 30 per cent., but has separated the duty on finished automobiles into two items, evidently with a view of affording a measure of protection to the higher priced American cars, the Senate provision fixing 45 per cent. as the rate for finished automobiles valued at $1,500 or over, and 30 per cent. for those valued at less than $1,-500. In the Democratic caucus, at which the amendments were considered, this latter provision did not meet with entire favor, and it may be changed before the bill is formally reported to the Senate itself. In

Digitized by Google

the caucus, a demand arose that the tariff on cars listing at $1,000 should be reduced to 10 or 15 per cent.

The objections filed by chain manufacturers also proved of some effect, the Senate committee raising the rate on "sprocket and machine chains" to 25 per cent. The House lumped all chains at 20 per cent. On the other hand, nuts, bolts and washers and nut bolt blanks of all sorts were reduced by the Senate committee from 15 per cent. to 10 per cent., and spiral nut locks and lock washers from 35 to 25 per cent., while insulated wire cable was pared from 20 to 15 per cent.

Files and file blanks, rasps, etc., all of which the House placed at 25 per cent., were amended by the Senate committee so that that rate now applies only to such machine-cut products, while a separate rate of 35 per cent. has been added for "hand-cut files and files of precision."

Mica and manufactures of mica, listed in the House bill at 30 per cent. ad valorem, has been amended by the Senate committee to carry a rate of four cents per pound when manufactured and valued at not more than 15 cents per pound. When valued at more than 15 cents and not more than 75 cents per pound, the rate is 25 per cent., and when valued at more than 75 cents per pound 20 per cent. On all "built up mica and all manufactures of mica or of which mica is the component material of chief value," the rate fixed by the Senate is 30 per cent.

Leather, however, has been transferred to the free list by the Senate committee having the bill in charge.

Called a "Thief," Demands $25,000.

Because the New York representatives of the J. I. Case T. M. Co., of Racine, Wis., said "He is a thief and should be behind bars," so he charges, Benjamin M. Weil, a dealer in new and used cars in New York City, filed suits this week in the Supreme Court for New York county for $25,000 for defamation of character. Some time ago Weil and the Case agency are said to have transacted a used car deal and the statements are alleged to have been made at some time later.

What Weil charges is "the defendant by its agents, servants or employes combined with one Coleman and one Llewellyn to injure the plaintiff by defamation in that the said Coleman and Llewellyn and this defendant . . . acting in the course of defendant's business . . . in the presence of divers persons," made the previously quoted remark, and "repeated the aforesaid false and defamatory words to many persons in and about the automobile district of the city of New York," where Weil is known to many tradesmen.

A. O. SMITH, MILWAUKEE'S BIG PARTS PRODUCER, IS DEAD

Long in Ill Health, Death Came Almost Without Warning—Son Will Succeed Father as President of Company.

After an illness of several months, Arthur O. Smith, founder and president of the A. O. Smith Co., of Milwaukee, died at his home in that city on Friday last, 20th inst. Despite continued ill health, his condition did not take an alarming turn until the hour before he passed away; his death, therefore, proved a shock to his friends.

Mr. Smith was born in North Prairie, Wis., on February 23, 1859. As a young man he engaged in the contracting and construction business, and several large private and municipal structures in Chicago, Kansas City, Omaha, and other Western cities are monuments to his genius. In 1896 he returned to Wisconsin, going to Milwaukee, where, with his father, Charles J. Smith, and his two brothers, he established the C. J. Smith & Sons Co., manufacturing bicycle parts. The company was one of the largest producers of its kind in the world.

With the advent of the motor car, Mr. Smith transformed the business into a motor parts plant and became sole owner. The plant at Clinton and Reed streets was enlarged, but the success of the business made it entirely inadequate, and a new main plant therefore was erected at 27th and Hopkins streets, which is one of the largest industiral structures in America. The main building is 1,025 feet long and 480 feet wide and contains more acreage under one roof than any single shop building known. The old works on Clinton street are being devoted mainly to the manufacture of bicycles and motorcycle parts, and the main works to motor car parts and commercial cars.

About 18 months ago the Smith company began the production of a truck of its own, under the name of Smith-Milwaukee, but this department in no way affected the parts business.

L. Raymond Smith, who has been his father's right-hand man for six or seven years, will succeed him as head of the company and general manager of its business. About six months ago the Smith family purchased all outside holdings, and Mr. Smith's heirs are sole owners.

Allen, of Fostoria, Chooses Directors.

The Allen Motor Car Co., of Fostoria, Ohio, which recently was incorporated with an authorized capital of $500,000, has linked with the Peabody and Columbia Buggy companies of that city, by whose principals the Allen company was organized. The directors were elected last week, as follows: E. W. Allen, Grattan H. Baker, Geo. E. Schroth, Mahlon T. Thomas, Ross J. Christy, John E. Wright and W. O. Allen, all of whom are prominent in banking and business circles in Ohio. In turn, E. W. Allen was chosen president and W. O. Allen treasurer.

Stearns to Acquire More Real Estate.

For the purpose of controlling some 460 feet of Euclid avenue frontage adjoining the Stearns factory in Cleveland, the F. B. Stearns Co. has added $200,000 to its capital stock. The property is owned by several men heavily interested in the Stearns company and, at the time of its purchase, possession was vested in a realty company organized for that purpose. The increase in the Stearns business has made it advisable for the stockholders themselves to take over the property and, accordingly, an agreement has been reached whereby the transfer will be effected by an exchange of the realty company's securities for stock in the F. B. Stearns Co. under certain conditions, $47,000 of the new stock being issued for the purpose. The remainder will be retained in the treasury.

Prest-O-Lite Forms a New York Company.

With a capitalization of $800,000, the Prest-O-Lite Co. was incorporated this week in New York State with the stated object of manufacturing generators for acetylene gas, which is the business of the parent company in Indianapolis. The incorporators are Frank E. Sweet and Samuel M. Cooley, both of Speedway, Indianapolis's "horseless" suburb, and Clarence Winter, of New York City, of the firm of Winter & Winter, the Prest-O-Lite attorneys. The latter state, however, that it will be several days before the company's plans are sufficiently near consummation for them to disclose "what's what."

Missourians Turn to Kerosene Engine.

With the development of a kerosene burning engine in view, the Missouri Engine Co. has been formed in St. Louis by Adolph E. Winkelmeyer, Hugo and Chas. Lippert and Harry Bain. They will perform their kerosene burning experiments and do a general metal manufacturing business at 2810 North Eleventh street.

Strikers Start Garage of Their Own.

Members of the Auto Repair Machinists' Lodge of Boston, Mass., some of whose members are on strike, have, opened a "lodge garage" on St. Mary street to afford employment for men who are out. The garage is being run by a commission of five union men, headed by Joseph Guinazzo.

BROKER SEEKING TO WRING MILLION FROM FAVARY TIRE

Result of Proposed Formation of $10,000,000 Corporation—Says he Unearthed Man with $2,500,000, Then got "Cold Shoulder."

When the Favary Tire & Cushion Co., whose principal is Ethelbert Favary and which is promoting a spring tire from an office in a New York skyscraper, conceived the idea of a $10,000,000 company to make and sell its product it did not anticipate the storm which loomed up this week when Frank A. Weed, a finance broker, filed suit in the Supreme Court for New York county for a round million dollars.

Favary holds 51 per cent. of the original company's stock and, according to Weed's complaint, he was engaged to hunt up a man who would advance $2,500,000 in real money in exchange for half of the stock in a new $10,000,000 corporation, the original Favary company to get the other half with the exception of 10 per cent. of the $10,000,000 stock, which was to go to Weed, provided he found the desired man. The agreement is claimed to have been made May 19 last and Weed claims it did not take him long to find the $2,500,000 man in the person of one Captain Edward Brinley, who was ready and willing to enter the deal on the terms stated.

Weed claims that not only did Brinley enter into the projected company but arranged with the original Favary corporation to exploit the Favary tire in Great Britain and France. Then, so Weed states, the Favary company repudiated its commission contract and declined to let him into the broker business on the 10 per cent. basis. He states that the Favary rights are of immense value and that the stock in the proposed company will be very valuable, wherefore he says he has been damaged to the extent of $1,000,000 and demands that

Lamp Maker Must Pay for Forged Checks.

The New York Coach & Auto Lamp Co., 2 West 53d street, New York City, is suing to interview a former bookkeeper named Robinson, whose actions while he was in the lamp company's employ caused judgment to be taken this week in the New York City Court against the lamp company and Patrick Keaveney, a liquor dealer, for whom Robinson cashed numerous checks at the Keaveney store at 780 10th avenue during a period of 18 months ending last June and of them nine were declared forgeries. Keaveney demanded that the lamp company make good on the bad paper, but the latter disclaimed liability and suit resulted. It was claimed that Harry Sutterman, president of the lamp company, had stated to Keaveney that it was all right to cash whatever checks Robinson presented. The verdict was for the full amount with interest.

Bumper Suit Must go to Trial.

Apparently neither side is to have a walkaway in the suit brought recently in the United States District Court for the Southern District of New York by Rollie B. Fageol and the Hartford Suspension Co. against E. R. C. Struthers with the object of restraining the latter from manufacturing concrete bumpers in his front parlor at 214 West 50th street, New York City, in alleged infringement of Fageol's design patent, No. 43,740, which is owned by the Hartford company. Recently the latter asked for a preliminary injunction, but this was denied by the court, and last week Struthers sought to have the case dismissed, but this, too, was denied, which leaves the merits of the patent to be threshed out in regular order.

Phoenix to Operate in Moose Jaw.

The Phoenix Mfg. Co., of Eau Claire, Wis., which has built gas engines and road and field tractors, has concluded negotiations for the establishment of a tractor factory in Moose Jaw, Can. That city has voted a bonus to induce the company to locate "in its midst."

Stutz Cars Cause Stutz Parts' Dissolution.

The Stutz Auto Parts Co., of Indianapolis, has been legally dissolved. The dissolution is chiefly a formality, as the company had ceased to be active as a producer of parts after its principals last year took up the manufacture of Stutz cars.

Warren's Valuation Placed at $282,000.

According to the receiver's inventory of the Warren Motor Car Co., of Detroit, which is to be disposed of at public auction today, the value of the assets as a going concern is $282,169.62. Its liabilities aggregate $375,000.

Peoria Man Made Midland's Receiver.

Edward McCullough, of Peoria, has been appointed receiver for the bankrupt Midland Motor Co., of East Moline, Ill. Whether he will be able to unravel the much-mixed affairs of the bankrupt is an open question.

Crow Adds 5,000 Feet of Space.

The Crow Motor Car Co. just has completed a brick addition to its plant in Elkhart, Ind. The structure, which adds 5,000 square feet of floor space, will be utilized as a machine-shop.

TRACTOR DIVIDEND OF 72% SHARES $105 AND GOING UP

Factory Isn't Built Yet But What of That?—Figures Can't Lie and Pioneer Company Is Some Statistician—What Project Is.

If anyone desires to obtain a quick glimpse of annual dividends of 72¼ per cent., the Pioneer Tractor Co., Ltd., which has opened an office in Detroit, will be pleased to unroll the picture. As the title of the company implies, this handsome return is to be earned in the production of agricultural tractors, the actual manufacture to be carried on in Calgary, Alberta, Can., where, it is stated, foundations for three buildings already have been laid.

The Pioneer Tractor Co., Ltd., itself is a Canadian corporation, capitalized at $2,000,000, and is an outgrowth of the Pioneer Tractor Mfg. Co., of Winona, Minn., under whose license it will operate. The president and general manager of the Canadian company is E. M. Wheelock. H. E. Blair is secretary and treasurer, and G. A. West is a director. Twelve other directors will be elected later. Blair and West are identified with the Winona enterprise which, according to the prospectus, "shows earnings of over 38 per cent. in its last annual statement."

Of the Canadian corporation's $1,500,000 preferred stock, $500,000 will be very kindly sold in the grain-growing provinces of Manitoba, Alberta and Saskatchewan, another $500,000 will be offered to all comers, residents of the United States particularly, and the remaining $500,000 will be retained in the treasury.

At the present moment, the $100 shares are being offered at 105 and all who do not "step up to the captain's office" in a hurry may have to pay an even greater premium, as it is stated that "the price will be advanced five points as each additional $100,000 is taken up." Despite the premium, however, the first subscribers to the stock in Detroit will receive free one share with each 10 shares subscribed for, and "installment subscriptions" will not be waved aside.

In some way, the promoters of the enterprise have obtained figures which apparently show that in the province of Saskatchewan alone there was but one gas tractor in 1906, whereas in 1911 the sum invested in such implements approximated a total of $6,655,000.

To make its offer still more attractive, that fact that Henry Ford is interested in and is building a farm tractor is remarked in large type, while in smaller letters the marvelous returns from original invest-

Digitized by Google

ments in Bell Telephone, Western Union, Westinghouse and other big dividend payers are flashed on the screen; few prospectuses would be complete without them.

The Pioneer Tractor Co. does not actually promise 72¼ per cent. dividends; it merely gives a suggestion of them. The preferred stock really bears only 7 per cent. interest, but that 72¼ per cent. is not impossible is demonstrated to the satisfaction of the promoters by an array of figures which show that it is possible to manufacture and sell 1,000 tractors annually at a cost of $2,354,650, and as the tractors will sell for $3,800 each, the gross receipts naturally are $3,800,000, leaving an actual profit of $1,445,350. And there you are!

Daimler Import's Settlement Accepted.

The Bankruptcy court in New York City this week confirmed the composition proposed in the case of the Daimler Import Co., as described in Motor World of last week, 19th inst., whereby all the Daimler contracts, six in number, revert to the parent company; also, during the next four years the creditors will receive $75 for each car and 5 per cent. on all parts imported. Other available assets are $7,872 and the liabilities $67,261.

Since the petition in bankruptcy was filed last fall the Paul La Croix Auto Co., Inc., of New York City, has been handling the Daimler sales, but whether this company will acquire the importing license is as yet undecided. The General Vehicle Co., of Long Island City, which manufactured Mercedes trucks under a contract which was canceled, is at persent operating under a tentative agreement, but is likely to be given a regular license. The pleasure car manufacturing rights are as yet to be disposed of, and it is hinted that, anyway, the German Daimler would rather build its cars in Germany than have them made here, producing in the latter case only a semi-foreign product, which may indicate that in pleasure cars importing will be the major business.

Knox Trustee Named Despite Objections.

Overruling the objections of the stockholders' committee, the Federal Court in Boston has appointed Charles G. Gardner, of Springfield, trustee in bankruptcy for the Knox Automobile Co., of that city. As bankruptcy schedules which have been filed show an excess of assets of liabilities of about $400,000 for a considerable equity of the stockholders, the latter propose to continue their campaign for the appointment of three trustees instead of one.

The stockholders' committee is also intent on working out a reorganization plan, the majority of the company's stock having already been deposited with the Old Colony Trust Co., in Boston. As a part of the plan, the Knox company assigned, last September, to Edward O. Sutton and Harry G. Fisk, who, with Charles R. Lewis, were later made receivers. The biggest stockholder is the estate of Alfred N. Mayo, who died one year ago to-day. Sutton and Fisk are Mr. Mayo's sons-in-law.

U. S. Tire Files Financial Report.

In compliance with the laws of Massachusetts, in which it is doing business, the United States Tire Co., of New York, has filed with the secretary of State a statement of its financial condition as of May 28, 1913. The figures, as compared with the company's statement on March 1, 1912, are as follows:

Assets.

	May 28, 1913.	March 1, 1912.
Real estate	..	$41,782
Real estate and investment	$330,474	..
Machinery, fixtures, etc.	..	120,183
Material, stock in process and equipment	9,395,452	2,981,686
Cash and debts receivable	4,193,728	2,535,540
Total	$13,919,655	$5,679,193

Liabilities.

Capital stock	$500,000	$500,000
Accounts payable	12,925,511	5,148,785
Surplus reserve	494,143	30,408
Total	$13,919,655	$5,679,193

Walter Receiver Renders Final Report.

Having acted as receiver of the Walter Automobile Co., of Trenton, N. J., since May 14, 1909, Harry S. Wright last week submitted his report, and application has been made that he be discharged. The receivership was asked by John L. Kuser, a stockholder, and others, and later the business was taken over by the Mercer Automobile Co., of Trenton. Between the appointment of the receiver and the absorption by the Mercer the report shows that the receipts were $4,818.67 and the disbursements $2,664.30, leaving a balance of $2,-154.37. The Walter company entered the trade with great expectations, but was unable to steer its course clear of financial shoals.

New Rule Affects Shipments of Gas.

Amending the Federal regulations covering the shipment of dangerous articles by freight, the Interstate Commerce Commission, on Tuesday last, issued the following order affecting the carriage of "cylinders containing inflammable gases."

When they are not boxed or crated for shipment, the commission orders, the safety device and discharge valve must be made safe from injury during transit by a design and construction of the cylinder, or they must be protected by strong metal caps that cannot be detached by rolling the cylinder.

"Carload or less than carload lots loaded by the shipper to be unloaded by the consignee may be transported without crating or boxing, provided the cylinders are loaded compactly in an upright position and are securely braced to prevent any relative movement during transit, according to the general methods prescribed by B. E. pamphlet No. 6 for bracing shipments for explosives."

Stephenson Truck Factory Still Idle.

Although it was expected that after the settlement of the litigation between the Stephenson Motor Car Co., of South Milwaukee, and the J. I. Case T. M. Co., of Racine, Wis., the former plant would resume the production of trucks it still remains idle and its future appears problematical, George L. Stephenson, its president and general manager, having become a factory representative of the Speedwell Motor Car Co., of Dayton, Ohio.

The Stephenson company sued the Case interests for an alleged breach of contract, according to the terms of which the former was to be purchasesd and taken over by the latter provided certain conditions were fulfilled. When the case came to trial, however, the court decided against the Stephenson people.

Preparing for Munger-Rubber Goods Trial.

Because a later suit was filed, in 1912, against the Rubber Goods Mfg. Co. in the Supreme Court for New York county by William A. Evans, as trustee in bankruptcy of the long-deceased Munger Vehicle Tire Co., a former action, begun in 1908, was this week discontinued. The suit is brought to compel the Rubber Goods company, which fathered the Munger tire until it looked hopeless, to pay $33,124.25 as the balance of a stock subscription of $84,000. This amount is the Munger company's only asset.

Oil Company Sues Dealer-Garageman.

The Standard Oil Co. of New York filed suit this week in the Supreme Court for New York county against A. W. Blanchard, Inc., a garageman-dealer at 101 Liberty street, Brooklyn, N. Y. The claim is for $543.60 for goods supplied between November 1 and December 10, 1912.

Two More Additions to Kinsey Plant.

The Kinsey Mfg. Co. has let contracts for two additions to its plant in Toledo. The larger building will be a one-story wood warehouse, 150 x 200 feet, and the other a one-story brick workshop, 50 x 200 feet.

under New York laws; authorized capital, $800,000; to manufacture generators for acetylene gas, etc. Corporators—Clarence Winter, 55 Liberty street; Frank E. Sweet and Samuel M. Cooley, both of Speedway, Indianapolis, Ind.

Minor Business Troubles.

A receiver was appointed this week in the Federal court in Boston for the Rex Motor Co., which maintained a plant in East Boston. The company was recently petitioned into bankruptcy by creditors.

A petition in bankruptcy was filed this week in the Federal court in New York City against Auguste Delbruge, who conducted a tire repair-shop at 256 West 41st street. The petitioners and claims are: Michelin Tire Co., $1,276.70; Goodyear Tire & Rubber Co., $366.26; Swinehart Tire & Rubber Co., $918.23. It is charged that Delbruge permitted the landlord to obtain a judgment for rent and that Delbruge transferred and converted part of his property between June 1 and 20.

William H. Fuller, trading in Pawtucket, R. I., as the Pawtucket Auto Co., has filed a voluntary petition in bankruptcy. He owes $10,942.37 in unsecured claims, $1,529.42 on three notes and $513.93 for other things. He states that his assets are $2,206.99, of which $30 represents furniture, clothes and other exemptions. The principal creditors are the E. M. F. Automobile Co., of Boston; the E. R. Thomas Motor Car Co., of Buffalo, N. Y., and Leonard Hinchliffe, of Peace Dale, R. I.

On the application of Max Brenner, a painter, a receiver was appointed this week in the New York City Court for the Gildale Motor Corporation which was formed some time ago with a capitalization of $30,000 to represent the Kline car in New York City; the principals were Theodore P. Gilman and his sons, Theodore P., Jr., and Edward E. The company never attained prominence and the Kline representation is now in other hands. Brenner's claim is for but $425 and is for labor and material supplied between January 14th and 21st, 1913.

Changes of Capitalization.

Portland, Me.—Auto Supply Co., to $50,000.

Detroit, Mich.—Metal Products Co., from $300,000 to $500,000.

Akron, Ohio—Diamond Rubber Co., from $100,000 to $10,000.

Akron, Ohio—S. & M. Tire & Rubber Co., from $20,000 to $500,000.

Indianapolis, Ind.—Cole Motor Car Co., from $500,000 to $1,000,000.

Columbus, Ohio—Pharis Tire & Rubber Co., from $25,000 to $50,000.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

W. H. Flinn has been appointed advertising manager of the International Motor Co., of New York. He succeeds R. H. Hutchinson, Jr.

Frank E. Fisher, for the past two years manager of the Studebaker Corporation of Canada, has resigned that office. He has not made known his plans for the future.

George W. Edwards has been appointed manager of the St. Louis branch of the General Motors Truck Co. The branch, by the way, will be moved next week from 1115 Locust street to 2815 Olive street.

F. E. Edwards, of Chicago, chairman of the technical board of the American Automobile Association, has resigned that office. He did so because of the fact that he is about to engage in the automobile business in Chicago, where he will handle the Edwards-Knight car.

W. D. Edenburn, former manager of the Henderson Motor Car Co.'s newspaper department, has resigned that position to become identified with the Apperson Bros. publicity organization. He will represent the Appersons on the Indiana-Pacific tour which starts from Indianapolis on Tuesday next.

William A. Maynes, of Los Angeles, has been appointed sales manager of the Frank O. Renstrom Co., which controls the Regal and Kline cars on the Pacific Coast. Maynes will establish headquarters in San Francisco and direct the business in the States of Washington, Oregon, California and Nevada.

Following the removal of the Lansden Co. from Newark, N. J., to Allentown, Pa., M. E. Kern has been elected its vice-president and general manager. He succeeds Geo. E. Blakeslee, of Jersey City, who was temporarily filling those offices. Kern himself has long been identified with the Macks of Allentown, who are heavily interested in the Lansden property.

Owners' Clubroom in Bagnell Salesrooms.

A clubroom for car owners will be a part of the new home which the Bagnell Automobile Co., of St. Louis, Mo., is having erected at 1409-11 Locust street. These rooms will be located on the second floor, where a space 21 x 35 feet will be fitted up with upholstered mission furniture, photographs on the walls, books, Cole literature and other conveniences. It is the intention of the Bagnell company to endeavor to create among Cole owners the impression that they are a big brotherhood in which the company has a paternal interest.

Binghamton Company Building Garage.

The New York Sales Co., of Binghamton, N. Y., has completed a new garage, 52½ x 173 feet, extending through a city block from 34 State street to 33 Collier street. Doors at each entrance are 11 feet wide and the driveway between the doors is 20 feet wide. The building contains salesrooms, storage space for 40 cars and a repair and service department, and is equipped with modern machinery and devices. The company, which formerly was located at 25 Washington street, handles Cole, Hudson, Paige-Detroit and Little cars. The officers are: President, C. E. Titchener; secretary, N. A. Boyd; treasurer and manager, C. E. Sweet.

Recent Losses by Fire.

Nantasket, Mass.—Nantasket Garage, garage damaged. Loss, $1,500.

Allentown, Pa.—Berwin Auto Co., garage and contents destroyed. Loss, $25,000.

Rome, N. Y.—Grant Smith & Co. garage damaged by explosion. Loss not stated.

Des Moines, Iowa—Lagerquist Carriage Co., plant and 12 cars destroyed. Loss, $50,000.

Indianapolis, Ind.—Indianapoliis Motor Car Co., 419 East Market tsreet, building damaged. Loss, $2,000.

Hans Adds $25,000 Factory Building.

The Hans Motor Equipment Co., of La Crosse, Wis., has awarded contracts for a new new $25,000 factory building which it hopes to have completed and in shape to turn out the Hans strainers, gauges, filler caps, etc., by August 15th.

Polack Wants Expressmen to Pay up.

The Polack Tyre & Rubber Co. has filed suit in the Supreme Court for New York county against Michael Keller and Joseph W. Bergen, who operate the Rockaway and New York Auto Express Co. The claim is for $210 for tires.

Schacht Assets Near to Half-Million.

According to the inventory of the bankrupt Schacht Motor Car Co., of Cincinnati, its assets total $243,854.75, which includes $19,000 equity in a piece of real estate. The company's liabilities approximate $175,000.

Keeton Enlarging for Testing Work.

The Keeton Motor Co. has commenced work on an addition to its plant in Detroit. It will be a one-story structure, 100 x 60 feet, and will be used for testing purposes.

William N. Beverle, of Phoenix, Ariz., has established a garage business on West 1st avenue. He has installed a complete machine-shop equipment, electrically operated.

M. B. Hooker has completed a new garage and livery stable in Charlevoix, Mich. The building, which is 100 x 50 feet, is located on Antrim street.

The Washington Cartercar Co., of Seattle, Wash., has completed a new building at 1515-17 Broadway. The salesrooms are 40 x 70 feet and the repair-shop and storage quarters 50 x 60 feet.

W. B. Paton, of Menatchee, Wash., has sold the Cascade Garage to T. M. Gibbons, formerly of Cashmere, in the same State. The new owner has changed the name to Ford Garage and will continue to handle the Ford line.

A garage is to be erected on the Niagara River, in Buffalo, N. Y., for the Amphibious Garage Co., which will cater to both motor cars and motor boats. The site is in what is known as the Jones tract and is between Ontario street and Riverside Park.

George W. Browne, president of George W. Browne Automobiles, Inc., of Milwaukee, Wis., is about to erect a three-story garage, salesrooms and repair-shop, 90 x 100 feet, at Broadway and Biddle streets. He has taken a 10-year lease on the site.

William Jackson and A. H. Pyle, formerly connected with the Schecher & Phiffer Garage in Horton, Kan., have branched out for themselves. They have opened a garage in the McNerney building, on Main street, and have secured several agencies.

A company to operate a garage and repair-shop has been formed in Wortham, Tex., and has erected a new building for its occupancy. The company consists of Roy Simmons, J. W. Lindley, Michael Wiedner, A. N. Weaver, Henry Meador and Dr. K. W. Sneed.

The Rawlins Automobile Co. has been incorporated in Muncie, Ind., to operate a garage and to sell cars. It is capitalized at $10,000 and comprises Harry Spickermon, Charles Rawlins, Frank B. Woodman and Robert Wild. The company's place of business is located on Mulberry street, between Howard and Seymour streets.

S. W. Kent Miller, formerly proprietor of the Central Garage in Hagerstown, Md., is about to reenter the trade, in Martins-

WHO IS THE OWNER OF CARS IN STOREHOUSE FOR DEALER?

Omaha Assessors Increase Assessment 228 Per Cent. and Raise Fine Point —Dealer Says Cars Aren't His Until He Gets Them.

Just who is the owner of cars which are held in a storehouse at the call of a dealer is a question which, when decided, will throw considerable light on the assessment question in Omaha, Neb., and which, if carried out into its minute ramifications, might have a bearing on the resale question which has attained such prominence following the overthrow by the United States Supreme Court of the Sanatogen price-licensing system.

In Omaha the question has been brought up by the Guy L. Smith Auto Co., and that this company is "making a fuss" is not provocative of surprise when it is stated that the County Board of Equalization decided a few days ago to increase the Smith company's assessment value from $8,500 to $28,000, an increase of more than 228 per cent. The company declares it will contest the increase. The advance appears to have been made largely because of a quantity of automobiles which are in a storehouse and which are taken out one by one and sold by the Smith company.

The equalizers hold to the opinion that these are the property of the Smith company and should be assessed at their proper assessment value, while the Smith company declares that it does not have possession of the cars until it draws them from the warehouse. To decide the legality of the increased assessment someone will have to determine the legal ownership of the cars involved.

Should it be decided that the cars are not the property of the Smith company until it takes them out of the storehouse to sell them it might not be impossible to argue further that the cars are not sold at all, not even by the manufacturer, until they have been placed in the hands of a customer by the dealer. On this basis there might be grounds for a manufacturer holding the dealer, as a sort of intermediary, to a fixed retail price.

Dealer Claims Apperson Broke Contract.

On the grounds that a representative of the Apperson Brothers' Automobile Co., of Kokomo, Ind., sold cars in its territory, the New Berlin (Ohio) Motor Car Co. has filed suit in the Common Pleas Court in Canton, Ohio, wherein it asks $3,720 as balm for its wounded feelings; the suit was filed by William Schumacher, Charles B. Strassner and G. Frank Smith, the members of the company, who allege that they were given the Apperson agency for the Ohio counties of Holmes, Wayne, Stack and Tuscarawas, that they agreed not to sell any other car of a competing price and that the Apperson company agreed not to sell any cars within the territory named.

The New Berlin men charge that during the term of the contract the Apperson company caused two cars to be sold in Hartville, O., a town in the territory in question, and that the commission on these was, or would have been, $720. The additional $3,000 is tacked on as damages to the New Berlin company's business through the manufacturer's action.

Subdealer Claims Deposit Was "Merged."

Claiming that a merger of dealerships in Syracuse, N. Y., "merged" a $1,250 deposit it had put up as a subdealer, the New York Sales Co., of Binghamton, N. Y., has filed suit, through its manager, Charles E. Sweet, against the James Automobile Co. and C. Arthur Benjamin, Inc., of Syracuse, N. Y., and the Hudson Motor Car Co., of Detroit, Mich. The complaint alleges that two years ago the Binghamton company signed up as a Hudson subdealer under the James company and put up $1,250 deposit and that later Benjamin, who now is sales manager for the automobile division of the American Locomotive Co., absorbed the James company. After this combination it is claimed that the requests of the New York Sales Co. for Hudson cars were refused, as was the return of its deposit. The action is filed in the Supreme Court for Broome county.

General Motors Truck Sues a Dealer.

The General Motors Truck Co. of Michigan has entered suit in the Rhode Island Superior Court against the Shepard Co., of Providence, to recover $35,000. The litigation grows out of an agency contract whereby the Providence company agreed to purchase 14 trucks and pay therefor $28,434 on delivery. The plaintiff alleges that although the trucks were delivered but $7,000 had been paid. It therefore sues for the balance due and "incidentals."

Two Cars Saved from Fire Are Stolen.

During the excitement attendant upon a $1,500 fire in the Nantasket Garage, in Nantasket, Mass., at 10 o'clock Sunday night, 23d inst., two of 30 cars which were rolled to the street and to safety were stolen. One is an old seven-passenger Packard, upholstered in red leather, and is owned by Edward M. Curran, of 40 Linden street, Boston. The other, also a seven-passenger vehicle, belongs to William W. Pettis, of 17 Walnut street, Abington, Mass.

COUNTING CHICKENS BEFORE HATCHING.

It may be true, as asserted abroad, that the "cyclecar is killing the cheap American car boom" in Great Britain, but it will require more than the mere assertion to carry conviction; it is more likely that the wish is father to the thought. Certainly, American export statistics do not bear out the statement, and unless Britishers, and Europeans generally, have lost their regard for comfort, and what may be termed the eternal fitness of things, it is difficult to believe that the cyclecar movement will attain more permanence abroad than it is likely to attain here.

Most of the so-called cyclecars produced abroad utilize either one-cylinder or two-cylinder engines, and where they are not driven by belts, and are not of toothpick construction they are so diminutive as to appear toylike. The cornucopias in the British blood must have lost some of their richness if it is possible that the subjects of King George will purchase such vehicles when they can obtain, for the same money or less of it, a "man's size" motor car, equipped with four-cylinder engine and otherwise affording more roadworthiness and comfort than can be obtained from the half-baked creations styled cyclecars.

Indeed, it does not seem probable that in any enlightened part of the world anyone will long make use of a one- or two-cylinder engine for a four-wheeled vehicle when a four-cylinder car is available at anywhere near the same price. However, if it really be true that the "cyclecar is killing the cheap American car boom" in Great Britain, then Great Britain is reckoning without the American cyclecar which is but just making its appearance. For the American article is a four-cylinder vehicle propelled by something more positive than a belt, and it will be sold at a price that, apparently, British manufacturers are unable to meet.

WHY NOT EMPLOY THE NEW TERMS?

Changing the language of an industry is not an easy matter, but that standardization of technical terms is highly desirable there is no room for doubt. For this reason, the effort of the Society of Automobile Engineers to bring about such a state of affairs merits more attention and consideration than has been given to it.

The report of the Society's nomenclature committee shows how much study has been devoted to the subject, and though its recommendations have not been formally adopted it seems impossible that their adoption will not come to pass. Meanwhile, a change of trade language can be assisted and the good work otherwise speeded if manufacturers, in compiling their catalogs and in issuing other printed matter, will make use of the terms which the committee has recommended for general adoption, after consideration of both foreign and American practise.

"Internal combustion motor" is such an inconvenient mouthful that "explosion motor" should readily find its way into use. "Gearing" is certainly as simple as "gearset" or "gears," while there is no doubt that "equalizing gear" and "differential gear" are as easy to employ as "balance gear," "compensating gear" or "differential." Also there is no reason why the recommended term "underpan" or "underguard" should not replace the very many other descriptives of that device. It may not be so easy to replace "fender" by "wheel guard," or "guard wing," but even that replacement is largely a matter of common usage.

SPORTING SUGGESTION SHOULD BE SNUFFED.

One of those good natured press agents who writes cheerful interviews with himself and puts the words in the mouths of prominent personages in the trade has caused one of them to assert that "motoring is the greatest American sport, regardless of what people may say about baseball."

Of course, the press agent meant well, and perhaps the man who is made to stand sponsor for the interview believes all he was made to say, but whatever the case, the definition of motoring as a sport and its comparison with baseball is not particularly happy.

Very many persons object very strenuously to being associated with anything of a sporting character, and in consequence are not likely to appreciate the efforts of even a cheerful press agent to supply "light reading" when it lends to anything they may use a sporting suggestion.

Motoring is a most delightful diversion—perhaps the most delightful one—but a sport or a game, never! The suggestion that it is in that category should be snuffed early.

TIMKEN DECRIES SALE OF TRUCKS ON INSTALLMENTS

Axle Maker's House Organ Says Few Manufacturers Can Afford to be Bankers, Too—Unusual Capital and Standard Product Needed.

One of the big problems that motor car manufacturers are facing to-day is whether or not it is good business policy to sell pleasure and commercial cars on the installment plan, says the Timken Magazien.

Conservative, well established firms say no, emphatically no, and they base their decision on the fact that there isn't one concern in a thousand that has capital enough to engage in the manufacturing and banking business at the same time.

In spite of this, several large makers of trucks are selling their product on the installment plan, accepting as low as 15 per cent. down and extending the balance due over a period of 12 or 18 months.

Looking at this problem from the standpoint of a concern that has watched the progress of the motor car industry for the past 10 years, the small cash deposit and deferred payment plan has put a good many firms out of business.

The only kind of a corporation that can hope to make a success of the installment business is one that makes an article in an old established line. One in which development and quick changes have ceased—where the cost of production, handling and marketing have become fixed elements.

The company that does a deferred payment business must have behind it an enormous cash capital and almost unlimited resources, otherwise the business will quickly flounder on the financial rocks.

Any person who doubts this should take a list of at least twenty companies and compare the amount of actual paid-in capital with the volume of business they do. Do the same with other businesses and you'll find that the motor-car industry is undercapitalized.

In the face of such evidence, on what grounds can any concern justify the adoption of a deferred payment policy if it already lacks the necessary capital to make and market its goods?

Who is responsible for the demand that trucks be sold on a basis of 15 per cent. down and the balance in 12 or 18 months? The indictment rests solely upon the shoulders of certain irresponsible truck builders who found they could not move their product in the face of competition, either because it wasn't as good a truck or because it cost them so much to make that the only way in which they could hope to make sales was by offering the additional inducement of deferred payments.

A "make good" truck cannot be built around a selling price. It takes a certain number of dollars and cents' worth of the right material and the right labor to make a truck that will stand up under all conditions, 365 days in the year, with a minimum of upkeep. The concern that makes such a product is entitled to, and can get, a profit that will enable it to stay in business. But the manufacturer who thinks he can build quality trucks and wait 18 months for his money won't be in business long. He can't afford to run a manufacturing and banking business at the same time.

Sit in the grandstand for a while and watch the procession of manufacturers, of both pleasure and commercial cars, go by. You'll find that the concern doing business on deferred payments rarely passes the reviewing stand more than once.

Red Tail Lamps Tabooed in Vermont.

If the example set by the State of Vermont is followed by other States, the familiar red disk in tail lamps soon will become a thing of the past. Vermont has legislated it off the roads and thereby established a precedent. The red disk, it appears, has been the cause of much annoyance to locomotive drivers, and particularly to the drivers of the Boston and Montreal express, which runs on tracks that parallel in several instances public highways much travelled by motorists. In a number of cases, it is said, the locomotive drivers have jammed on their brakes and jerked their trains to a halt at what they supposed to be a danger signal but which on investigation turned out to be nothing more than the tail lamp of an automobile. Hence, complaints were made to road commissioners in several New England States and, as a result, Vermont already has acted and the others are likely to go and do likewise.

Firestone Makes Factory Workers Guests.

Departing from the usual custom of making managers, salesmen and other headquarters' attaches the chief figures of a "joyfest," President H. S. Firestone of the Firestone Tire & Rubber Co., of Akron, Ohio, provided a diversion one day last week by making the factory superintendents, foremen and other actual producers and their wives the guests of an automobile ride to the century-old Firestone homestead, 75 miles from Akron, where a dinner was served in the open air beneath the trees. After the "feed" and speeches by Firestone and others, the party returned overland by moonlight. Among the guests and one of the speakers was District Attorney Charles L. Whitman of New York county, a boyhood friend of Firestone.

MERRY SEVEN-WEEK STRIKE WAR ENDED BY INJUNCTION

New York Lamp Makers Deprived by Court of Pleasure of "Beating up Scabs"—Stutman Tells the Story of His "Tough Luck."

Ending a strike by injunction may not be the newest thing in the industrial world, but it probably never worked better than it did in New York last week, when the strikers in five lamp and radiator repair shops and garages laid down their arms—but didn't go back to work; at least, but a small portion of them went back and, as a result, there are a half hundred very disgruntled workmen in New York this week.

The strike extended through seven long, hard weeks and feeling was warm, so warm, in fact, that there were numerous physical encounters and the employers spent a not small sum for guards to watch their property and protect those men who did work and for taxicabs to get the men to and from the shops. So far as number of men and money invested in plants is concerned, it cannot be called a minor strike, but for those who took part it was far from a minor affair.

It began April 30, when the members of Local Union No. 137 of the Amalgamated Sheet Metal Workers' International Alliance walked out. From then on things were lively. According to affidavits which were presented in an injunction action brought in the Supreme Court for New York county by the Hudson Auto Lamp Works, Inc., of Broadway and West 51st street, pickets were stationed outside the shops, the men were harassed as they entered and left, and many "black" eyes were distributed as souvenirs of the industrial skirmish. Some of the exciting instances came at quitting time, for it was the custom to get the departing workmen into taxicabs and rush them to some elevated or subway station; often the strikers set out in pursuit in other taxicabs and then it was a battle of chauffeurs to see whether the men got safely to their homes. In one instance which is cited it was a mere block in traffic which held up a taxicab long enough for the pursued to make a getaway."

The shops affected were those of the Hudson works, the American Lamp Works, 243 West 47th street; the Columbia Lamp Co., 243 West 47th street; the New York Coach & Auto Lamp Co., 302 West 51st street, and the Superior Lamp Mfg. Co., 2422 1st avenue. The men were getting from $21 to $23 a week and demanded a closed shop and other union conditions. Last week the Hudson works decided that having its workmen beaten up and harassed was not only monotonous but expensive, so it secured an injunction against the local union and Samuel Ballinger, Harry Broadsky, Joseph Chatkind, William Finkelstein, Edward Hayman, Jacob Kline, Samuel Lechter, Harry Schwartz, Joseph Stutman, William Victorowich, Edward Valinsky, Jacob Walterman, Samuel Zalsberg and Harry Strauss, the first names being fictitious. Forbidden by law to picket as they had picketed, the strikers quit.

There was an element of pathos in the case of "Joseph" Stutman, a striker, for he was so sick he "couldn't beat up the scabs." Accordingly to the affidavit of a "scab," Stutman, shortly after the strike started, met this man on the street and said, "Whoever goes to work in any of the striking shops is going to get licked. We're going to fight them; we'll fix them, all right. Last year I was strong and could break a man and could lick 'scabs,' but this year I am sick and will have to leave it to others to lick the 'scabs'; we ain't going to let any men go up to work in the shops."

Outside of the fact that it really is rather tough on "Stut" not to have been in good physical condition and to have been obliged to leave it to others to "lick the scabs," the strike is past history.

Zuccarrelli Killed in Grand Prix Practice.

According to cable despatches, Paul Zuccarrelli, the Italian racing driver who drove one of the three Peugeot cars in the 500-mile race on the Indianapolis Speedway on Decoration Day, was killed at Evreux, France, on Thursday last, 19th inst., while practicing for the Automobile Club of France's Grand Prix race; Fanelli, his mechanician, also was killed. At the time of the accident, Zuccarrelli is said to have been travelling at nearly 113 miles an hour over a supposedly clear road. A peasant's cart emerged suddenly from a side road and Zuccarrelli's car struck it full force, swerved and turned over, pinning both driver and mechanician beneath it. Strangely enough, the peasant was unhurt beyond a few bruises, though those who witnessed the accident were so enraged at him that they soundly thrashed him then and there. Zuccarrelli's most recent victory was in the Grand Prix race for light cars held at Le-mans in September, 1912.

Wires Should Be Separately Fastened.

When electric wiring of any sort comes loose, two strands never should be held in place under the same fastener, for if they are there is danger that vibration will chafe the insulation and cause a short circuit. The better way is to use separate fasteners for each.

GERMAN TRIES TO "PUT ONE OVER" ON WILLYS-OVERLAND

Under Unrecognized Name Seeks to Buy 1,000 Chassis to Be Fitted With German Bodies—Part of Anti-American Campaign.

German rivalry and German prejudice sometimes take queer turns. When the competition of the American bicycle became keen, some of the German manufacturers and dealers resorted to almost unbelievable methods to stem the tide. They endeavored to boycott even the papers which carried American advertising and themselves printed ads of a violent nature in the effort to poison the German mind against the American "invader."

During the last year or so the American motor car has been made the target for similar practices, but the most sensational development in the line of meeting or crippling American competition has just come to light in the form of an effort of a prominent German manufacturer to purchase 1,000 Overland chassis with a view of equipping them with German bodies and selling them under his own name.

When the request for quotations was received by the Willys-Overland Co., as the name of the German was not recognized, the communication was ignored and little more was thought of it until the recent arrival in this country of Kurt Isserstedt, the Overland distributer in Germany. When he reached Toledo the letter was shown to him and he instantly identified the signature as that of one of the largest automobile manufacturers in Germany, although the latter had concealed his tracks by using a false name. He also is a man whose attacks on American automobiles have been particularly vicious, and, while it is assumed that it was his intention to turn American contsruction to his advantage, in view of the violent campaign which he has conducted, whether he had in mind baser skulduggery than that to which he has resorted is an open question. At any rate, he won't get the chassis at any price.

Crossing Continent in a Closed Car.

When J. W. Carton, who is driving a Studebaker "35" Sedan from Los Angeles to New York City, reaches the Metropolis, he will be the first man to have made the transcontinental trip in a closed car and he will be the holder of a record of a new kind. Carton and his car, which with passengers and baggage on board weighs 4,400 pounds, have reached Kansas City, Mo., after having traversed the worst of the roads likely to be encountered on the trip.

AVOIDING MISUNDERSTANDING

Why Details Should Be Explained to Buyer Before He Is Asked to Pay for Things He Didn't Expect—Ford Salesman's Experience.

Once a month the sales men and department heads of the Detroit branch of the Ford Motor Co., of which W. A. Ryan is manager, hold a get-together meeting. The object of the meetings are education, inspiration and a cultivation of that quality known as "esprit du corps." Sales and technical problems are discussed and the meetings have proved of substantial value in throwing the light of experience on the pathway of young salesmen.

"A striking illustration of the value of having details thoroughly understood occurred recently," said Manager Ryan. "All the cars delivered from this branch go out with full ten gallons of gasolene in the tank and with an extra gallon of oil. For this we make a charge of $2.50, so that the price of a Ford touring car thus made ready for the road is exactly $602.50. One of our men made a sale a few days ago to a man and he drove the car downtown with the purchaser, his wife and family in order to get a check at the man's office. 'How much did you say the car was?' queried the purchaser, filling in the check. 'Six hundred and two fifty,' was the answer. 'What's the two fifty for?' asked the customer. The salesman explained that the charge was the regular charge for ten gallons of gasolene and a gallon of oil.

Illustrations Proved Unavailing.

"The customer argued that he ought not to be asked to pay for it. The salesman said the charge was perfectly legitimate—told him that if he bought a stove he would not expect to have it filled with coal and otherwise brought home to the man that when he bought a car, gasolene and oil did not go with it. The man grew irate and said he wouldn't pay a cent more than $600.

"'Here, you can take the cost of the gasolene out of your commission—that will settle it—for I will never pay it,' said the customer.

"'Why should I pay for it?' asked the salesman; 'besides, I don't work on commission; I work on salary. If you don't want the gas and oil let's drive back to the garage and take it out.'

"The suggestion did not make a hit.

Canceled Sale at Payment Point.

"'Get out of the car!' commanded the man to his wife. 'But I am not dressed to get out downtown,' she protested. 'Never mind, get out of the car!' said the husband, who had now persuaded himsef that he was fighting for a principle that must be maintained at any cost.

"The salesman diplomatically offered to drive Mrs. Purchaser home, which offer was accepted. We sent a different man down the following day to see the man and he ran right into the salesman for another car, who was just departing after having taken the order.

"True, this buyer was an unusual type, but it brought home the fact that the salesman should make every detail clearly understood early in the deal."

BLACKBOARD THAT PROMOTES EFFICIENCY IN REPAIR-SHOPS

A shop blackboard used by the Foster Motor Sales Co., Detroit, which sells Stevens-Duryea automobiles, has proved a great help in maintaining the efficiency of the repair department. It hangs to the left of the garage foreman's desk, which is placed just outside the repair department and in the garage proper.

On this blackboard is a complete list of repair jobs in the shop, including job-ticket number, name of car owner, and a condensed statement of the work required. Telephone calls regarding repair jobs are referred to the garage-foreman and a look at the blackboard gives him the job number and the details, so that he can take the matter up instantly with the repair department and give a quick reply to the inquirer.

Each morning the list is brought up to date. It helps the foreman to follow up work, gives a quick reference, saves time that used to be lost looking for papers that were liable to be misplaced and in a sense is an adaptation of Hugh Chalmers's idea of listing the "ten important things." Needless to say, a job cannot remain long undone in this shop; the blackboard reminder is too potent to allow any "sleeping."

KEEPING ADVERTISING LITERATURE IN PRESENTABLE SHAPE.

Advertising literature, such as booklets, pamphlets, etc., makes its best impression when it reaches the prospect spotlessly clean. With this thought in mind, a mid-Western dealer who sells Hupmobiles takes great pains to keep all advertising matter free from dust and dirt.

An adequate supply of booklets and folders always appears on the table in the showroom, and these are kept neatly arranged in piles so that a salesman can place his hand on exactly what he desires without wasting a second. But there is a reserve stock neatly indexed and kept in drawers from which is drawn the literature used for mailing. Not a piece of printed matter goes out of this dealer's place unless it is "fresh as a daisy."

Those dealers who have been in the habit of dumping their entire supply of advertising matter on a showroom table and permitting it to stay there to get flyspecked and dusty or musty will find it profitable to draw a hint from the experience of this very successful dealer.

HANDLING "TOUGH" PROSPECTS

Dealer Who Holds That Struggling With Man Hard to Sell Is Wasted Time—Believes He Should Be Left to Worry Competitors.

"How much time should I devote to the ... prospect?" is a question which has ...led more than one dealer, and many ... been unable to decide whether to act ... the plan that a prospect never should ... given up or to operate under the theory ... time should be spent where it will pro... sales; a Michigan dealer who has been ... than ordinarily successful in his own ... establishment and in building up an ... ent sub-dealer organization has a plan ... own and his success adds weight to ... ression of this situation. His theory is ... in that he believes in making the ... prospect an asset instead of a lia... and how he does it is best exempli... one of his own illustrations.

Hears "Bill Smith Hasn't Closed."

"Let us suppose," he says, "that my man ... goes to Algonac, registers at the ... eats, chats with the proprietor and ... generally with the hotel people. In ... rse of his conversation it develops ... Robinson is selling automobiles, and ... man confides that Bill Smith is ... to buy a car and hasn't closed yet ... of the dealers.

... soon drops in at the drug store, ... gar, strikes up a conversation with ... k and lets this center of gossip know ... selling cars. The clerk 'tips' Robin... the fact that Bill Smith is going to ... car but hasn't 'closed' yet. When ... n reaches the local agency he is told ... that Bill Smith is going to buy a car ... n't closed yet.'

... ately Robinson takes the dealer ... and advises him not to spend any ... time on Bill Smith. 'Don't try to sell him,' says Robinson. 'He is one of your assets. Let him alone. He will draw all your competition, they will all waste their time and money trying to sell Bill Smith. Maybe they will spend a day or two at it, but they won't sell him; and by the time they get through with Bill Smith they won't have time to worry about the real easy ones.

"If Bill Smith has not bought he either wants wholesale prices, a better and more comprehensive guarantee than anybody wants to give, or he hasn't got the money. Why bother with him? Let the other fellows have him if they can get him."

BENEFITS OF SEPARATING GARAGE FROM REPAIR-SHOP

Keeping the repair-shop separate from the garage or salesroom is an idea that is growing in favor, as was pointed out in the Wide-Awake Merchandising Department of May 29, and in illustration of the reason why was cited the experience of a dealer in Jackson, Mich., who enumerated the advantages derived from this plan. He said it permitted the men to devote their time to individual jobs without being called away for the numerous little things that bob up about a garage or salesroom and also kept disassembled cars in the repair process out of sight of car owners.

Separation Gives Mechanics Leeway.

But that there is a slightly different angle to the question and an added advantage in that it permits the mechanics to do their work without the interference of men who are not skilled mechanically is asserted by G. F. Bischoff, of Rochester, Pa., whose letterhead bears the words "Automobile Mechanic."

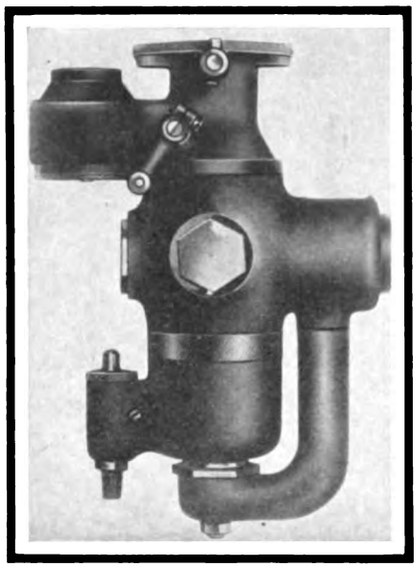
"Motor World's mention of the subject recalls an incident of about two and one-half years ago," writes Bischoff, "when I was working in a garage in Altoona. The firm had an Oldsmobile, seven-passenger car, that had a rattle in the back end which the boss demonstrated to me over a rough piece of road and then told me to fix up the brakes. 'That's where the trouble is,' the manager said. I looked at the brakes, but disagreed with him; then looked at the manager's positive manner and came to the conclusion 'that's where the rattle was'—against my own judgment.

"Well, I spent more than half a day rigging up four springs to keep the brakes away from the drums and from rattling. Then we tried her out—same thing as before, and the manager exclaimed to me, 'That didn't fix it!' The next step was to turn the car over to me to hunt it out and fix it, which I proceeded to do by taking the car back in the shop and taking up the lost motion in the spring seats on the axles. That is the trouble I encountered in several shops—someone in authority, or the owner, making suggestions when, if left to themselves, the repairmen quickly would locate the real trouble."

WHAT MAY HAPPEN WHEN BILLS ARE NOT RENDERED PROMPTLY

The value of getting cash for repair jobs or, at least, rendering bills immediately on delivery of a job, cannot be too strongly emphasized.

A Cincinnati dealer did some repair work on a car in December and for some reason or other the bill was not rendered till March. Instead of instantly paying it and appreciating the time gratuitously granted, the customer brought in his car with a kick about some trouble that had developed later. And the dealer had to remedy it—without charge—before the customer paid the bill.



The labor cost was equal to 25 per cent. of the bill and the dealer, while conceding the point, felt morally sure that the new trouble must have developed some time after the car had been delivered. His bills now follow the job within 24 hours.

KEROSENE SPRAY HEATED IN HARROUN CARBURETTER

Fuel Nozzle Opening Automatically Controlled by Auxiliary Air Valve —Main Air Hot, Extra is Cold —Only One Adjustment.

Of kerosene carburetters there is one that has attracted more attention than kerosene carburetters usually do—the Harroun device, made by the Ray Harroun Co., of Indianapolis, Ind., which has shown excellent results in extended tests and already has been offered as an option by the makers of the Henderson car. For several reasons, however, Harroun himself has been loath to have his carburetter illustrated, but finally has permitted photographs to become available, and while many of the details as to its construction are not given out, owing to pending patent matters, enough is known of it to give a good idea of the working of the apparatus.

HARROUN'S KEROSENE CARBURETTER

Exhaust heat is employed to vaporize the kerosene, as is usual in kerosene carburetters; the heat is applied to the kerosene after it has been partially atomized and mixed with a small quantity of air. It may be said, however, that the entire charge of gas is not heated to any great extent, for the rich gas is greatly diluted with cold air from the auxiliary air intake, which brings the temperature down considerably. The fuel in the float chamber is not heated. The flow of fuel from the spray nozzle is regulated, according to the demands of the motor, by the opening of the auxiliary air valve, there being a connection between the two. Only one adjustment is provided, and this may be operated from the dashboard without the necessity for the driver leaving his seat.

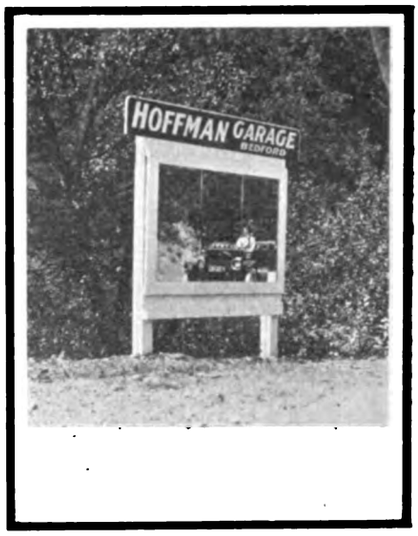
In the vertical type carburetter shown in the illustration the outlet to the intake manifold is at the top. At the bottom is he float chamber with the main air inlet passing through it; the air for this is heated by being taken in around the exhaust gas passage, which is on the right side, about half-way up the carburetter. The gas passes into the carburetter and surrounds and heats the venturi chamber, after which it is discharged in any convenient way. While the main air intake is heated, the extra air, as already has been stated, is admitted cold; the extra air valve is shown at the top of the carburetter on the left.

It is necessary to start on gasolene or on acetylene by a priming system; but once started, it is claimed that a motor fitted with the Harroun carburetter will do anything that it will do with a conventional gasolene carburetter. The mileage, however, is said to be about 10 per cent. higher than with gasolene, and to this saving, of course, must be added the much lower initial cost of the fuel. Gasolene, kerosene and the various motor spirits, or mixtures of these fuels, are said to be handled with equal facility by the Harroun carburetter. In changing from one fuel to another, no adjustment is required beyond that which can be made from the dash.

The interesting fact is brought out by the Harroun people that if the compression of the motor is very high it should be reduced to obtain the best result from kerosene, the proper pressure being about 60 pounds. They also state that L-head motors can be more successfully equipped for kerosene fuel than can T-head motors. Cylinder lubrication should be cut down one-half, as that much less oil is needed when kerosene is the fuel.

Polishing Both Points at Same Time.

A strip of thin steel, such as a piece of a hacksaw blade, with a piece of fine emery cloth glued to each side makes an excellent double-faced tool for dressing the faces of platinum contact points. It will smooth up both faces at the same time and, if the work is carefully done, leave them parallel, which is a matter of n olittle importance if long life is to be considered and freedom from burning expected.



Weights of Gasolene and Water.

There is considerable difference between the actual weight of gasolene and water. The average gasolene now sold weighs a shade under 6 pounds per gallon, while water weighs 8.32 pounds per gallon. Kerosene comes in between with 6.6 pounds per gallon.

ROADSIDE MIRROR AS MEANS OF BRINGING GARAGE TRADE

Wide-Awake Pennsylvanian Combines Public Service with Garage Advertising—Unusual Method of Pleasing Motorists.

Bedford, which is down in the southwestern part of Pennsylvania, may not have more than 2,200 population, but it has a very enterprising and wide-awake garageman in the person of Lee F. Hoffman, proprietor of the Hoffman Garage. Evidence of it is contained or reflected in a looking-glass that is located near Bedford. The device, which has proven efficacious abroad, is a "danger turn" mirror and is erected at a sharp and obscured curve in the road west of Bedford at what is known as the "Narrows."

HOFFMAN'S TWO-PURPOSE MIRROR

Hoffman has so placed a 4 x 6-foot mirror that drivers coming from either side of the turn can see the reflection of the road and any vehicles that may be coming from around the corner; this makes it unnecessary for a driver to creep around the turn for fear he will collide with another car, and is an ecective preventive of accidents which otherwise might be avoided only with difficulty.

But—Hoffman operated from more than a philanthropic motive when he erected the mirror, for whoever looks at it must needs see the name "Hoffman Garage" across the top, and if the gratitude of the motorist is properly expressed many dollars from the transient trade should flow into the Hoffman till. Anyhow, it is one of the surest indications to the tourist that the owner of the Hoffman Garage is very much alive both to his own interests and to the interests of others.

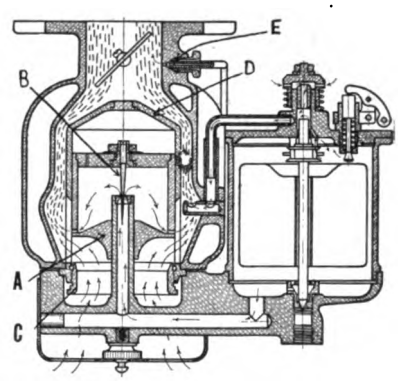
FRANKLIN COVERS 84 MILES ON SINGLE GALLON OF FUEL

Air-Cooled Car Sets up Almost Unbelievable Record Under Unquestionable Auspices — How the Test Was Carried Out.

For a four-cylinder automobile, 20 miles on a gallon of gasolene is, as any slangy chauffeur will admit, "pretty good going"; 25 miles is unusual; 35 miles is astounding; 45 miles is nothing short of phenomenal, and to claim anything more than that is to be classed immediately with Ananias and Sapphira and other historical truth-stretchers. And yet on Saturday, 21st inst., a four-cylinder Franklin Roadster—air-cooled, of course—completed no less than 83.5 miles on a single gallon of commercial gasolene under the official supervision of the Testing Laboratory of the Automobile Club of America.

The run is a world's record, of course; it is a record for anything that runs on four wheels and is propelled by gasolene and has been beaten only by a motorcycle. The nearest to it that any one has come was on May 15, 1906, when in the two-gallon efficiency contest promoted by the A. C. A., a Franklin car carrying four passengers travelled 87 miles; that also is a record. The one-gallon record, too, was made with a Franklin car, 46.1 miles being reeled off on July 11, 1909, in the Automobile Club of Buffalo's one-gallon economy contest. By way of startling comparison, the new record is just 37.4 miles better than the old record! Figured down about as finely as it can be figured, it means that a single drop of gasolene will propel Averell and his Franklin a matter of nearly 75 feet!



AVERELL AND CHASE IN FRANKLIN ROADSTER UNDER FUEL TEST

For just six hours, S. G. Averell, who owns the car in question, and who drove it for the H. H. Franklin Mfg. Co., of Syracuse, N. Y., in which he is interested, guided it over the roads of Long Island in an endeavor to use up that lonely gallon of "gas," and long before it gave out all of those who witnessed the more than phenomenal run were heartily tired of it, for it seemed as if the little car never would stop. When it finally did cough to a halt within a couple of hundred yards of the starting point in Long Island City, one of the party of trade paper men who trailed it in a big six-cylinder Franklin touring car scrambled out of his tonneau seat and grasped Averell by the hand. "Averell," he said, "let me congratulate you—on stopping."

The car with which the test was made is a roadster in which wind resistance has been reduced to a minimum, as is made plain by the accompanying picture; it weighed when empty 1,690 pounds and with Averell and Herbert Chase of the Testing Laboratory of the A. C. A., who acted as the supervisor, in their seats, the weight was 1,955 pounds. The gasolene that was used was purchased in the open market by the A. C. A. and tested out at 63 degrees. The dimensions of the motor are 3⅛ inches bore and 4 inches stroke, and except for the fact that it has slightly longer pistons to raise the compression, though it was not raised to the point where it could be called exceptionally high, and that a Newcomb carburetter was used instead of the usual Franklin carburetter, it conforms to stock definitions; no other changes were made in it. The chassis, however, is special all the way through and was constructed with the view of reducing weight to the minimum. The final gear ratio was 1½ to 1 and only one rear wheel was driven, the differential being inactive.

The test was started at 10:30 on Saturday morning on the Queens Boulevard in Long Island City, two blocks from the Packard service building, after Herbert Chase, assisted and watched over by three newspaper men, had carefully filled a one-gallon dash tank with a measured gallon of fuel brought from the A. C. A. laboratory for the purpose. The modus operandi throughout the whole of the test was to speed the car up to about 22 miles an hour and then to stop the motor by closing the throttle, disengage the gears and the clutch, and permit the car to coast until the speed dropped off to about seven miles an hour. The throttle then was opened and the motor started by dropping the clutch into engagement after the gears had been shifted. During the test, two stops were made because of traffic blocks in Long Island City, and one stop when the motor was stalled in attempting to turn the car on a narrow road.

NEWCOMB CARBURETTER IN SECTION

From the starting point, the route led out to Massapequa, L. I., by way of the Queens Boulevard, the Hoffman Boulevard and the Jericho turnpike; at Massapequa, which is 31 miles from the starting point, the car was turned and the return journey was commenced over the same route. The car traveled up hill, therefore, the same distance that it travelled down hill, and at the point where it finally came to rest the elevation was approximately the same as that at the starting point. Going out, the wind was with the car, but coming back the wind was against it.

That Averell misjudged the distance he could travel before his fuel gave out was revealed by his choice of Massapequa for a turning point; Long Island City was reached on the return journey at 2:40, and though it was figured that the gasolene must have been all, or nearly all, used up, the car continued to run without any signs of stopping for nearly 1½ hours afterward! During that time Averell drove twice nearly to Flushing over very poor Belgian block

Digitized by Google

pavement, made two circles around the Bridge Plaza, and went twice out over the railway bridge for a considerable distance past the original starting point; it was on the second trip out over the bridge that the car finally quit. It is likely, therefore, that if the original outbound trip had been continued quite a little further, the total mileage would have been greater, for traffic slow-downs and poor pavements in Long Island City then would not have been encountered.

The Newcomb carburetter with which the car is equipped is produced by the Holtzer-Cabot Electric Co., of Boston, Mass., and was adjusted by E. C. Newcomb, its inventor, who accompanied the run. No doubt quite as much credit for the record is due to the carburetter as is due to Averell for his generalship in handling the car.

The carburetter itself differs from anything else of its kind in that it has a fuel metering device which is best made plain with the aid of the accompanying cross-sectional view. The metering mechanism consists of a hollow plunger (A) surrounding the pipe at the top of which the fuel nozzle is located. A fuel controlling needle (B) is fixed to the upper part of the plunger near the bottom edge of which a number of small holes are drilled to distribute the fuel after it has issued from the main fuel measuring orifice. These holes are arranged to register with an equal number of relatively narrow air slots cut in the plunger tube or chamber. The plunger is seated on a regulating collar (C), the office of which is to withdraw the fuel needle from its closed position by raising the plunger without uncovering the slots in the chamber (D).

Consequently, when air is drawn through the carburetter, the plunger lifts in proportion to the amount of air drawn. The needle in the nozzle lifts, at the same time releasing the proper amount of gasolene to charge the entering air. The amount of gasolene in the mixture therefore always is proportionate to the amount of air drawn in. To adjust the mixture, a lever traversing a graduated arc on the top of the float chamber is provided; this lever adjusts the back suction on the fuel in the float chamber; when turned toward "Poor," the back suction increases, reducing the flow of fuel and weakening the mixture; when turned toward "Rich," the back suction is reduced and the mixture enriched. This adjustment is uniformly effective over the whole range of speeds. To assist in vaporizing low grade fuels, the vaporizing chamber is enclosed in a jacket, which was connected to the exhaust and heated in this way. The speedometer used is a Casgrain, and though the original reading showed 86.6 miles, subsequent correction reduced this reading to 83.5 miles.

FOG-PENETRATING LAMPS DIFFUSE GOLDEN BEAMS

Esterline Productions Follow Scientific Theory—Ingenious Reflector Construction and Bodies Without Hinges or Humps.

The fact that the most powerful white light is baffled by mist or fog, being reflected back to the observer's eyes and increasing the apparent density of the vapor, has bothered drivers for a long time, and not a few theories have been advanced with a view to evolving lamps that would enable a light to be forced through fog. One of the theories is that yellow light will penetrate further than any other, and it is on this

ESTERLINE GOLDEN GLOW LAMP

theory that the Esterline Co., of Indianapolis, Ind., has constructed its line of Golden Glow lamps, one of which is shown in the accompanying illustration.

The lamps which bear this suggestive name have other claims upon interest than the mere fact that they give a yellow light, however, and not the least is the manner in which the reflector is made. Instead of the usual metal parabolic reflector, there is a glass one, moulded of special glass and ground to shape inside and out, after which the back is silvered and the silvering protected by a coating of copper electrically deposited. Thus the actual reflecting surface is permanently protected by glass on one side and copper on the other and needs no polishing; the glass surface is, of course, easily wiped clean and does not tarnish like metal. The glass is colored to produce the desired "golden glow" which gives the lamp its name and is responsible for its penetrative powers.

Exteriorly the lamp bodies are particularly clean and attractive, being innocent of hinges and most of the usual projections. The lens-holding device includes a series of phosphor bronze springs which hold the glass firmly and prevent rattling, and at the same time permit expansion and contraction under temperature changes and practically eliminate the risk of cracking. The glasses are readily removed and replaced, despite the absence of hinges. As the focussing of the bulb in the reflector is of the utmost importance, a thumb-screw at the back of the lamp, outside, is provided for this purpose, so that the adjustment can be quickly and accurately made without opening the lamp.

Headlights are made in four sizes, from 9¼ to 12½ inches in diameter, besides special searchlights which run up to 15½ inches in diameter and take bulbs of from 25 to 100 candlepower, and side and tail lamps. The tail lamp, be it said, is as distinctive in its sphere—which is no joke—as are the other lights in theirs, for it is formed of a solid globe of ruby glass, in which is formed a white glass lens to pass the light to illuminate the number plate. The globe is, of course, mounted in a suitable metal base which contains the requisite lugs, wire leads and bulb socket. As there are no joints to rattle or admit dirt, the lamp has features that are distinctly appealing. The name of the car can be etched on the glass or, for that matter, any desired design or monogram.

Steal Three Cars a Day in Chicago.

Although thieves in Chicago, since January 1, have made away with 540 cars valued at about $810,000, the police department makes the creditable report that cars to the value of $700,000 have been recovered and in the recovery 15 persons have been sent to jail or fined, leaving but about 70 cars still unrecovered. Many of them were taken for joy-riding purposes and were subsequently located in distant parts of the city, often minus robes, tools or other equipment. The police state that the average theft is three cars a day, each of which averages $1,500 in value.

Chicago Forbids Colored Headlights.

Colored headlights on automobiles, which are said to cause confusion because it makes it difficult to tell whether a car is going or coming at night, are prohibited by an ordinance passed last week by the City Council of Chicago; the ordinance also carried an amendment which provides that an individual, firm or corporation which puts an unlicensed driver on a public vehicle becomes liable for any damages resulting from the chauffeur's driving and operation of the vehicle.

REILLY'S OPINION OF "TELEPHONE SALESMEN"

Declares It's Poor Policy to Cover Territory by Wire Simply Because It's Convenient—Salesman Whose Trade Fell Off Because He Preferred Long-Distance Talking to Long-Distance Walking.

Reilly and the Sales Manager argued heatedly in the former's office, which was not at all surprising, for the Sales Manager had asked Reilly's advice on a sales question and events had followed according to this now well-worn formula: Question, Reilly's opinion, Sales Manager's opinion, argument, more argument. Also the formula in one other respect held true this time in that, while the original argument started over one thing, it wasn't long in veering to another and another thing, until now the two were deep in a verbal battle as to the respective merits of various organizations and individuals in the National and American leagues.

"Now Philadelphia——" began the Sales Manager, as he pushed his hat back on his head for effect.

"This is Mr. Reilly," interrupted that individual, as he pulled the ringing telephone toward him and lifted the receiver.

"No, nothing doing to-day that I can think of just now," he replied to the questioner on the other end of the wire. "Sure! Good bye."

"Now Philadelphia——" again began the Sales Manager, who this time, having exhausted the hat-pushed-back move, pulled one foot more tightly over the other knee and hitched forward in his chair as a means of emphasizing his opinion.

"HE'S LAZY," SAID REILLY. "HE'S A TELEPHONE SALESMAN"

The Sales Manager was in position and had a finger aimed in gesticulation, and it was a shame to spoil such a good beginning, but Reilly threw him out at first with, "Aw, forget Philadelphia! This guy that just called me up is from Philadelphia; they're all alike; no hope whatever."

"Yes, but——" The Sales Manager was choking for a chance to talk.

"But nothing! If you've got to say it, write it and mail it to me and I'll look it over, but nothing good ever came from Philadelphia. That salesman who just called me up is a sample and your baseball teams will wind up just as he will."

"How? What——"

"In second division."

"Who's the salesman?"

"Byrnes, of the Blank Auto Supply House."

"Byrnes? I thought Jerry Noyes traveled through here for them," said the Sales Manager.

"He did, but they took him into the office on a better job and sent Byrnes out here a couple of months ago," replied Reilly.

"And Byrnes——"

"Is lazy," supplied Reilly.

"How so?"

Called Twice Then Used Telephone.

"Well, as an example," answered the dealer, "I haven't seen him but twice since he started to come through here. He's a telephone salesman. Noyes used to sell me quite a lot of stuff, and I suppose I was regarded as a good customer, so Byrnes, after calling on me a couple of times to see what I looked like, calls me on the 'phone as a general rule and doesn't take the trouble to come up at all."

"Does he sell you anything?"

"Once in a while—— There!" exclaimed Reilly, with a snap of the fingers. "Now that he's gone I've thought of something I need, and it often happens that way."

"Huh!" was the Sales Manager's only comment.

"Jim," asserted Reilly, "the telephone is one of the greatest blessings and one of the greatest curses that ever found its way into selling work. It can be used to wonderful advantage or disadvantage, all depending upon how it is used."

Telephone Judiciously Used a Help.

"Perhaps you're right," parried the Sales Manager.

"Don't you know I'm always right?" asked Reilly with a smile. "I am this time, anyway, I insist.

"If a salesman makes judicious use of the telephone it is a great help to him, but when he uses it just because he's too lazy to make a personal call it's a poor means of making sales. Take Byrnes, for instance. When the weather was cool and the walking was pleasant he used to cover the 'row' quite thoroughly, but since the sun got warm and the walking got hot he makes most of his calls from the hotel or some other place. I suppose he peels off his clothes in his room, orders up a couple of high ones, turns on the fan and calls up his customers. I don't believe his summer trade will show up very

Digitized by Google

heavy—in fact, I know of several places that don't give him many orders over the telephone, and I suppose he explains to the house that trade will pick up in the fall. Maybe it will—if some competitor doesn't take it away from him this summer and have it all sewed up by the time the weather cools off."

"Don't you ever use the telephone in selling cars?" asked the factory man.

"Certainly; it's one of my greatest helps," answered Reilly. "But I don't use it when I think a personal call will be more advantageous."

"No?"

"Certainly not. I don't believe dealers who are in business for themselves—that is, live dealers—are lazy, as a rule; they are working for themselves, and the more they work the more they make, and they can't afford to be lazy. Furthermore, if they are lazy some live dealer generally gets their agency away from them. But there are some dealers and a great many salesmen who abuse the telephone.

Telephone Salesmanship That Lost.

"I don't know all about all the salesmen in town, but I do know one who is going to get the gate if he doesn't wake up. His boss, who happens to be one of my neighbors is getting wise to him and the boss doesn't approve of a man who won't work. This salesman can sell cars if he wants to; in fact, any salesman who will work hard can do pretty well, but this one is slipping down hill; he won't work.

"Just to show you a sample of how he works, or doesn't work: He got one prospect started and made a couple of calls on him, and with consistent effort I believe the man could have been persuaded to buy this salesman's car. I believe it because he bought another car of about the same size and price. But after the salesman got the deal under way he sort of laid down on the job. The prospect lives and has a little business away out on the hoopskirts of the town, and it was quite a chase for the salesman.

Face-to-face Conversation Desirable.

"Now, don't misunderstand my attitude. If the salesman had used the telephone occasionally to supplement his other work it would have been very good, but he used it entirely. He used to call this man up and try to talk car to him over the telephone. He tried to give the prospect a beautiful word picture of the car while the prospect was sitting in his office and the salesman was in the salesroom and the car was several miles from and out of the sight of the prospect. It was like trying to send a photograph by telephone. The prospect didn't come along as fast as he might, and one day when the salesman called him up the prospect said he had bought a car.

"'Bought a car!' almost shouted the salesman.

"'Well, an automobile; that's sometimes called a car, isn't it?' said the prospect.

"'Y-y-y-y-es, but I thought you were going to buy one of our cars; why did you buy that make?'

"'I did think of getting one of your cars at one time,' said the ex-prospect, 'but this one seems to be pretty good; I guess it'll do.'"

"What did the salesman do?" questioned the Sales Manager.

"All 'phone" or "No 'phone" Both Bad.

"Hung up," said Reilly. "What could he do? The sale was gone, wasn't it?"

"Gone quite a way, I should say."

"'All telephone' and 'no telephone' are equally bad," went on Reilly, "but the correct proportion is excellent. In the case of this salesman, if he had persisted in intruding his presence into the prospect's home or office every time he wanted to communicate with him he would very likely have made a nuisance of himself, and as it was his work didn't count for anything. After he got the prospect coming he should have used the telephone, made appointments, made personal calls, written letters and done all those things. In that way he could have fired many more shots at his target without making a nuisance of himself and could have done much more effective work."

No Fixed Formula for Selling Moves.

"What's your formula for mixing all those things?" asked the Sales Manager.

"There is no formula," declared Reilly. "It's a mixed-to-order affair. It all depends on the salesman and the prospect, and the salesman has got to do the mixing. It will be the same in no two cases, and a man has got to be an excellent salesman to figure it out to the perfect proportion. A proportion that is not perfect often wins, but a lop-sided method like that I just told you about is a sure loser.

"There used to be a district manager for an Eastern automobile factory who covered this territory and who tried to get me to take on his line along with yours; he called on me once or twice and then fell back on the telephone, just as he did with a number of other dealers in town. I finally told him he was wasting his time and mine calling me up, and he quit it."

"Chicken Hunter," Too, Disliked Work.

"Didn't he come to see you after that?"

"No, I guess he didn't realize that what I objected to was his trying to do business by telephone, so he kept away entirely. I will say, however, that it would not have done him any good if he had called on me personally."

"Do any of our men fall down? Any that you know of?"

"No, I don't know of any," replied Reilly; "in fact, I don't see many of them except you. But I'll bet Lugner, who used to have the territory that Meck now has, used to use the telephone quite freely in order to get himself more time for chicken hunting."

"I should say he did," exclaimed the factory executive. "That was one of the things that impaired his efficiency. He would go into a town, and if he didn't want to waste time on the dealer he would call the dealer on the telephone, say howdy and use the rest of the time for devotion to his pleasant side line."

"By the way, what's Lugner doing—got a job yet?"

Salesman Who Worked Like Real One.

"Yes," replied the Sales Manager, "he's taken that territory for one of our rivals, and I don't know whether to worry or not. Lugner is a pretty good man if he wants to be."

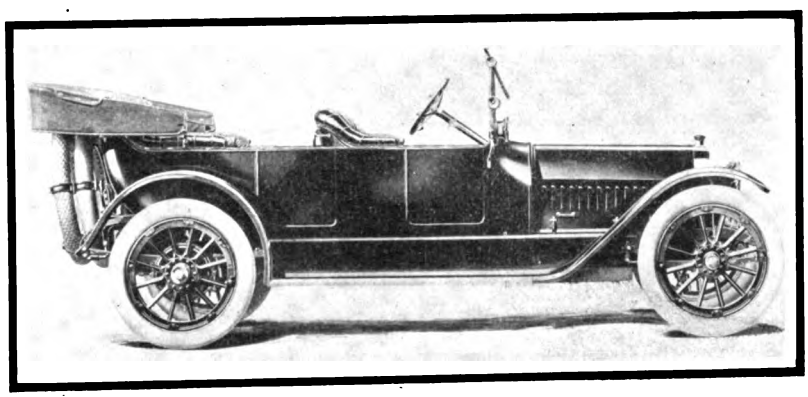
"You should worry!" laughed Reilly with assurance. "With Tom Meck out there Lugner is the man who should worry. Meck'll give him the hottest opposition he ever got in all his life—and it won't be over the telephone, either."

"Didn't Meck come from Philadelphia?" inquired the factory man, with an air which meant to inform Reilly that a point was being scored on the baseball argument; but the point was lost in the answer.

"No, not 'from Philadelphia' but 'away from Philadelphia'—and as soon as he got wise to the town."

Weed Conducting Window Display Contest.

A window display contest in which dealers and accessory men are invited to exhibit their skill in trimming their windows with Weed chains has been inaugurated by the Weed Chain Tire Grip Co. The restrictions are few, dealers being permitted to submit as many photographs of windows as they desire, and the entire display "layout" being left to the dealer. Photographs, however, must bear the dealer's name in ink on the backs.



The prizes are $100, $50, and ten of $10 each, in addition to which the Weed company will advertise the winners in any newspaper the winner selects for this purpose in his town or locality. The contest closes July 15 and the awards will be made August 1. The contest is being conducted by the advertising department of the Weed company, at 37 West 39th street, New York City.

REAL LONG STROKE MOTOR IN LATEST KISSEL "SIX"

Has Unit Power Plant with Block-Cast Cylinders—Four Speeds with Direct Drive on Third — Left Steer and Center Control.

With the first out-and-out long-stroke motor that has been installed in a car bearing the Kissel name-plate, the first model has been turned out of the new Kissel factory at Milwaukee, Wis.,—a plant that has a floor space of 250,000 square feet, is complete in itself and independent of the parent plant at Hartford, Wis., and is intended for the manufacture of this one type of car. The latest product of the Kissel Motor Car Co. is a six-cylinder machine with a bore and stroke of 3¾ x 5½ inches, respectively, and is rated at 48 horsepower; as might be expected, it embodies the cardinal features of the older Kissels, not forgetting the four-speed gearset with direct drive on the third speed and an overstep fourth.

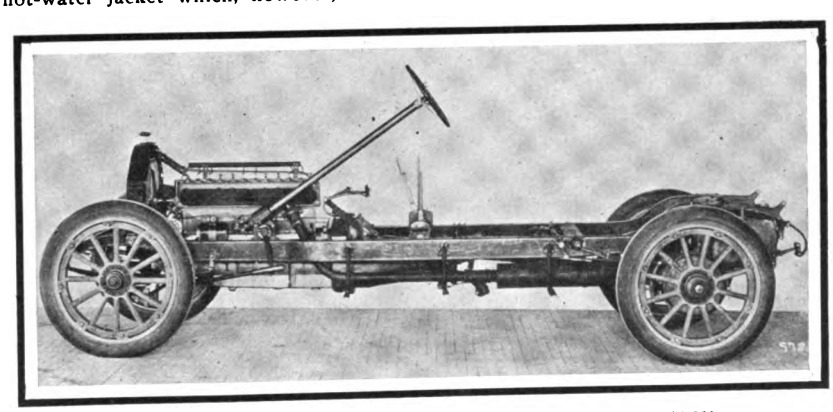
KISSEL "6-48" CHASSIS SHOWING "KICK-UPS" IN THE FRAME

A feature of the car is the low hanging of the body, which is brought about through the skilful use of "kick-ups" at the front and rear of the frame, despite which there is ample road clearance. The appearance of the body is enhanced in no small degree by its clean outlines, the rounded pressed steel fenders and the general absence of external attachments. The dashboard has a cowl of moderate dimensions, the rear of which carries a mahogany board on which are arranged the various meters and other instruments, plainly visible by day and also by night, an electric light providing nocturnal illumination. Left steer and center control are standard.

The six-cylinder motor is an extremely smooth, neat machine with the cylinders in a single block and the valves all on one side—the left. The gearset and engine are mounted as a unit and the whole is hung on a three-point suspension. The leather-faced cone clutch, however, can be removed without taking down the gearset and without trouble. The Mea magneto and the circulating pump are driven from cross shafts at the front of the motor, and the whole power plant is conspicuously accessible. The lubrication system is of the now popular constant circulating type with the pistons oiled by splash and the crankshaft and connecting-rod bearings fed by oil forced through ducts drilled through the crankshaft. The usual reservoir below the crankcase serves to collect the returned oil, which is strained and re-circulated.

As the gasolene tank is hung low down at the rear of the chassis, the gasolene feed to the carbureter is effected by means of a piston pump which is operated by a cam on the engine camshaft. The carburetter has a hot-water jacket which, however, is intended to be shut off in warm weather. A waterproof Mea magneto furnishes the high-tension ignition current, the distributing wires being carried through a tube above the cylinders.

Final drive is by propeller shaft and bevel gears; the rear axle, in addition to being stiff and strong in itself, is fitted with a truss which adds not a little to its strain-resisting ability. Brakes are large, with ample friction surface, the drums being no less than 5 inches wide and 14 inches in diameter. The usual internal and external arrangement is employed, the external brakes being for service use and the internal brakes for emergency application.



In the springing of the latest Kissel former practice has been somewhat departed from, for instead of having three-quarter elliptic rear and semi-elliptic front springs, the latest machine has semi-elliptics all round; the front springs are 38 inches long and the rear springs 52 inches, and all are 2¼ inches in width. The pressed steel frame is formed with a narrowed front and is designed to give maximum spring clearance.

The wheelbase is 132½ inches, which is just half an inch more than the 50-horsepower "four" and 7½ inches less than the big 60-horsepower "six." The tread is the standard 56 inches. Wheels are the same size all around, as are also the tires, which are 36 x 4½ inches.

It is evident from the finish and equipment of the car that it is not intended to lag behind its competitors in any respect. A complete electric lighting and starting system stands at the head of the equipment list. The top is the Golde patent one-man top, which eliminates front brackets and also eliminates much of the trouble that commonly attends the putting up of a protecting device. The rest of the list is complete, including the usual tools, of course, and shock absorbers, speedometer, odometer and clock, windshield, tire irons, rails and, in short, everything needful to put the car on the road without delay.

Close attention has been given to the matter of upholstery, which is of a special mixture of hair and is no less than 11 inches deep, covered with black leather. Access to the comfortable interior of the tonneau is through doors that are a full 21 inches wide, permitting even the most ponderous passengers to get in and out with the least possible trouble.

Three body types are built on the "six" chassis—touring car, which lists at $2,350; limousine, costing $3,850, and berline, the price of which is $4,100.

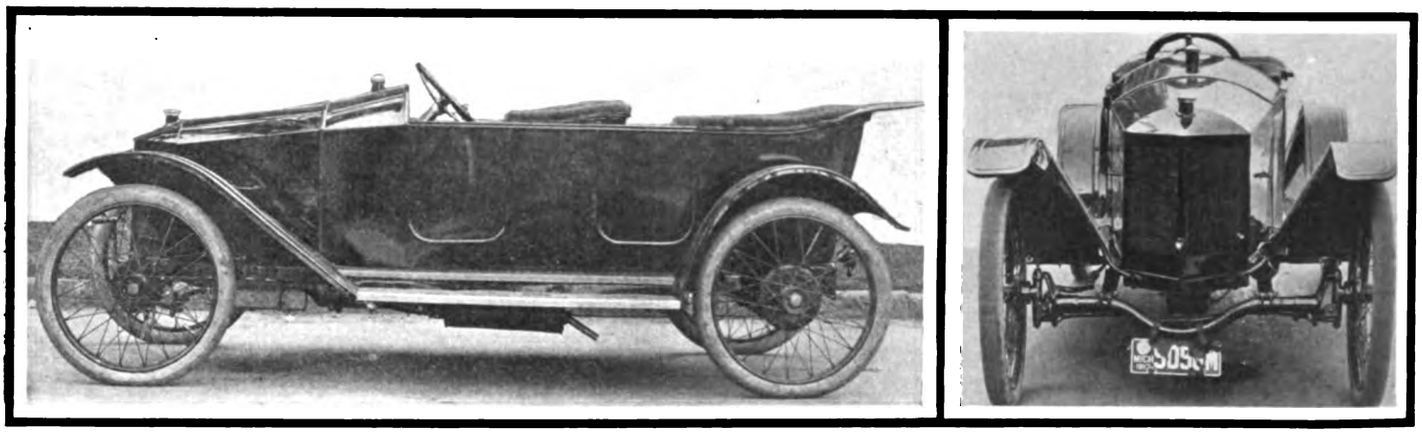
DETROIT'S FIRST CYCLECAR IS CHRISTENED CARNATION

Tandem Seats and Narrow Tread Mark New Company's Initial Product—Has Four-Cylinder Motor and Sells for $495.

Detroit has a sure enough cyclecar, and it probably is the first American vehicle with specifications that rightfully entitle it to the name originated by the Royal Automobile Club of Great Britain and applied to those miniature vehicles which are said to be creating a furore abroad. But even though it is a cyclecar, as its narrow tread and light weight make plain, its manufacturers have not hesitated to eliminate from its design at least two visible attributes that probably have influenced more than anything else the designation; the car is not belt driven, nor is it without a differential—also it shortly will be produced in four-passenger form. Otherwise, it is a cyclecar and a good-looking one, too, as the accompanying illustrations show.

In name, the car is the Carnation, and it is produced by the American Voiturette Co., of Detroit, Mich., which is capitalized at $500,000, and which has as its head Chas. B. Shaffer, who is president of the Keeton Motor Co.; William G. Houck, 2nd vice-president and director of sales of the Keeton company, is vice-president and director of sales of the new company.



Eventually, three models of the car will be produced, the photographs which are reproduced herewith showing side and front views of the first model, in which the driver and his single passenger are carried tandem fashion after the manner of the original Bedelia cyclecar which appeared first in France. The other two models will be a four-passenger touring car with a conventional seating arrangement and a roadster in which the passengers sit side by side. The list price of the first model is $495.

It is in weight and in tread that the Carnation most nearly approaches the R. A. C. definition of a true cyclecar, which is classed as a vehicle weighing not more than 784 pounds and having an engine in which the piston displacement does not exceed 1,100 cubic centimeters. The Carnation weighs complete 710 pounds and the tread measures 44 inches. The engine has four vertical water-cooled cylinders measuring 3¼ x 3¾ inches, bore and stroke, respectively; the piston displacement therefore is 124.4 cubic inches, which is equal to 1,936.9 cubic centimeters; the A. L. A. M. horsepower rating is 16.92.

From the engine, power is transmitted to the rear wheels through the intermediary of a clutch, a three-speed and reverse selectively controlled gearset, a shaft and a live rear axle incorporating a differential of the orthodox type. The steering wheel is located in the center and the gear shift lever is placed at the driver's right hand. The original Bedelia cyclecar had, and still has, for that matter, its steering wheel placed in the center with room for the single passenger behind the driver. It differs from the Carnation, however, in that it has a twin-cylinder air-cooled motor, is driven by side belts running over V-shaped pulleys and is minus the usual differential. Having no belts to slip and break and being equipped with a proper differential, the Carnation, therefore, palpably is far ahead of the original cyclecar idea as embodied in the Bedelia.

Wire wheels are used exclusively, and they are shod with 30 x 3-inch tires both front and rear; the brakes are mounted on rear-wheel brake drums; the wheelbase is 100 inches. Despite the light weight of the car and its small size, the body is roomy and low-hung, and it is said that the car is capable of a speed of at least 50 miles an hour.

In appearance the car is unlike anything else of its kind, what with its slanting hood, its V-shaped radiator and its peculiar seating arrangement. The upholstery is done in Bedford cord cloth and the seats have a backward rake that is calculated to make them the acme of comfort. Standard equipment includes a round windshield, electric lights and all the other usual fixtures of the ordinary light car.

SIDE AND FRONT VIEWS OF DETROIT'S FIRST CYCLECAR—THE CARNATION

Dealers Still "Blaming the Magneto."

While it is still possible to pardon an owner for thoughtlessness of the sort, it was supposed that there was no dealer or repairman now in the business who had not learned that when ignition appears to be at fault one of the most elementary tests is a change of spark plugs, which usually will betray ignition trouble.

That not all dealers have learned the simple lesson, however, is instanced by the Briggs Magneto Co., of Elkhart, Ind., which only recently was obliged to send a representative all the way to Florida to prove to a car manufacturer and a dealer that the Briggs magneto was not at fault when trouble of the kind arose. The dealer had received a shipment of several cars, none of which could be made to start. As too often is the case, the magneto was promptly blamed, but the Briggs expert, after making the long journey, quickly demonstrated that the fault lay entirely with the plugs; the porcelains of all of them were porous. The substitution of good plugs for the defective ones immediately and permanently remedied the trouble and exonerated the magneto from blame.

Would Eliminate "Dead Beats" in St. Louis.

The move by St. Louis dealers for the elimination of bad credits has taken the form of a petition to the tradesmen asking them to put their businesses as nearly as possible on a cash basis. At a meeting last week of the St. Louis Automobile Manufacturers' & Dealers' Association 30 of the dealers agreed to the proposition and the assent of others is being sought.

LITTLE CARD THAT IS A BUSINESS KEYSTONE

Dealers in Syracuse Retain Growing Trade Through Medium of a Diminutive Service Calendar—Owners' Directory and How It Helps Sales—Rivals Can Have It if They Want It and Dealers Don't Worry.

A New York banker, so the story goes, sat in his office one day talking with another man, when a third man thrust his head through the door and shouted, "Quarter?"

"Yes."

"Month?"

"Yes."

"Four and a half?"

"Five."

"Right."

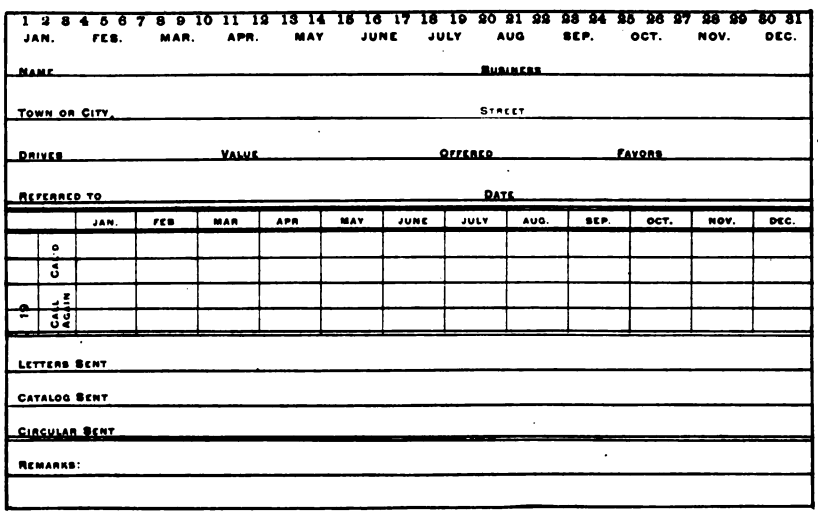
The door banged and the high-speed visitor was gone, while the man who had been conversing with the banker stared in amazement. "Is he crazy?" he asked.

"No," the banker replied, "he's a busy man from Chicago, and I just loaned him a quarter of a million for thirty days at 5 per cent."

Maybe it's true and maybe it isn't, but there isn't any particular reason why it shouldn't be true, for many a big deal has hung on a smaller thing than that and many a small thing has been the basis of a big deal or a big business.

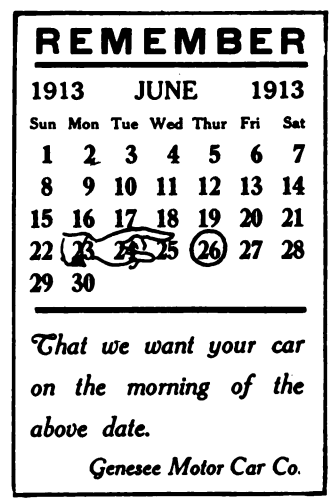
A master mechanic in a small steel mill, when called upon to repair a fractured hammer bed, of iron, drilled holes and screwed the two parts together, each day battering down the screw heads as the two sections were hammered closer together. But—each screw was kept from moving by a powerful cement. A master mechanic from another mill, having heard of the repair job, came to look it over. The successful mechanic told how it was done—but he kept the cementing part a secret. The result was that when others tried to do the same kind of a job they failed, for the screws would not set tight. The little daub of cement was the thing that was lacking.

To say that a card, 2 inches wide and 3¼ inches long, could be the secret of success for a dealer who does a big and paying business might seem presumptuous, and the Genesee Motor Car Co., of Syracuse, N. Y., which employs the card, might smile at the imputation, but an analysis of the business which is done by the proprietors, C. H. and G. H. Norris, shows that more than they might think hinges around just such a card. Of course, the card is but a part of their business system, but it in reality is a keystone, a basic element in making sales, or an indicator which points to the principles employed in the business.



Calendar that Helps in Service.

This card is a little calendar, and there is a different card for every month; across the top in underscored red type is the word "Remember" and at the bottom of the card, "That we want your car on the morning of the above date." Stamped in blue upon the calendar, a hand points to an encircled date, which is the company's notification to the owner of a car that at such a time his car should be at the service station for a monthly inspection.



So much for the card; thus far it doesn't look much like the keystone of a business structure. But—this card is the important element in the dealer's service, the dealer's service makes friends of the car owner, the car owner furnishes the majority of the dealer's prospects, and these prospects furnish the profits of the business; so while other things contribute the little card stands out predominantly. Every new owner gets one of these cards every month during the first season of his ownership and the card, standing upon his desk with the hand pointing at the date, furnishes a never-failing reminder of the day he must have his car inspected. Also, the owner is always in possession of a calendar for the month in transit.

Prospects obtained from owners are the mainstay of the Norris brothers' business, and the owners' list is an important element in the conduct of the Genesee Motor Car Co.'s affairs. Making one car sell another is an angle of salesmanship to which they pay particular heed, and that nearly 400 Cadillacs are running in their territory is one indication that the pathway they have chosen to follow is not an undesirable choice.

After a man has bought a car and has taken it to the service department, it is in-

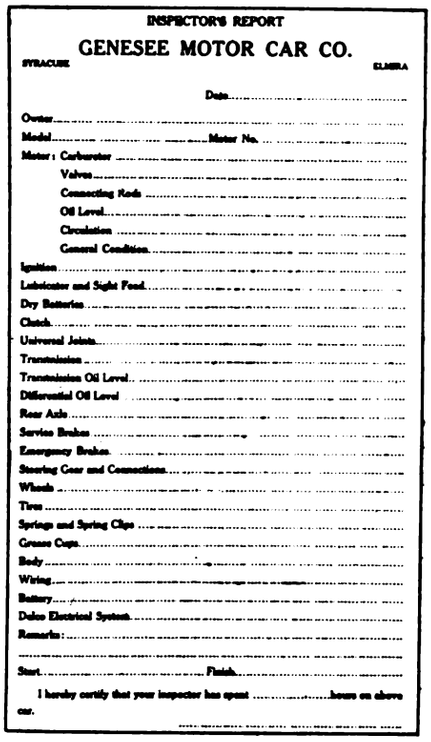
MONTHLY SERVICE REMINDER

Digitized by Google

spected by a mechanic who can slight no part and successfully evade detection. He has a form which governs his work, and he must inspect every part and its functioning, even to the inside of the clutch and the oil levels in the transmission, differential and motor. When he starts his inspection of the motor, the first item is the carburetter, then the valves, the connecting rods, the oil level, circulation and general condition. After each separate inspection he notes the result and, when he has finished, the owner or his chauffeur signs the blank, acknowledging the amount of time spent on the car. Inspections are free, but necessary work is charged for.

Inspections Often Much Extended.

The company's attitude to owners is shown by the number of inspections which run over into the following season. Jones buys a car in September; the inspection guarantee is for a season, and the season is near its close. Jones asks if his inspections may not extend into the next season, and they are extended not only into but through the following season. The prospects which are furnished by owners are of as great a variety as are owners.



"We learn after a while to distinguish likely and unlikely prospects by our knowledge of the owners who furnish the names," said G. H. Norris. "There are owners who are so anxious to help us that they will give us the name of a man if he so much as mentions the word car, while others are more conservatice and, while they do not furnish so many names, those they give us yield a larger percentage of sales.

"Our owners' list is one of our best advertising assets, and we make full use of it. We have compiled a booklet of Cadillac owners in our territory and this, we have found, is very valuable. The booklet contains nothing but names, and I know of salesmen for other cars who carry our owners' directory in their pockets. I suppose their idea is that they may be able to pull some of our owners away from us and sell them the cars they handle, but thus far we have found no occasion for worry and are still distributing the booklets. We believe that after we have sold a man a car we are quite likely to be able to keep him for a customer.

Owners' Directory as Aid to Sales.

"The list is revised and the booklet reprinted quite frequently, and we always see to it that the car owners gets copies; the owners like these booklets; they show them who owns cars. When we send one of these directories to a man who is on our prospect list it is quite likely to do more toward selling a car than any salesman could do. We simply mail him the list; he opens the book and right off, on the first page, he finds 14 cars owned by men connected with the Solvay Process Co. These are men, many of them, who are worth millions, and if these men, who are able to buy any kind of car they want, have picked out a Cadillac, it is a sales argument which doesn't need much talk it back it up."

The booklet is 3½ x 8¼ inches, and is easily carried in the coat pocket. Besides the owners of whom Norris spoke, there are many doctors and business men, and the list, on the whole, makes a very creditable showing. The latest edition of the directory

WHAT THE INSPECTION COMPRISES

contains 357 names, scattered throughout Central New York.

When a prospect is entered on the agency's list for following up, his name is placed on a card which is very complete in the information for which it furnishes space. The card tells the name of the man, his address, business, the car he drives, its value, what he wants for it, the kind of size or style of car he favors, the salesman to whom the prospect was referred, the letters, catalogs and circulars mailed, the dates the salesman has called and has arranged to call, with months and dates across the top for the checking of past and future demonstrations.

Each salesman is given a record of the work he is supposed to do each day, and a report of what he did is supposed to be in the hands of his employers the following morning. If he has failed to get to any of the assigned tasks they are given to him again, but if the man was seen the call is noted, any remarks to be made are entered and the card is filed with the date of the next call noted thereon. These cards are obtained from a company making a specialty of this work.

In seeking a location the Genesee Motor Car Co. selected an advantageous spot at 252 West Genesee street. This is three blocks from the very center of the city and the business section, and is on the old New York State Genesee turnpike, the thoroughfare of across-State travel and also of most of the travel to the western part of the city. The service department is maintained at another place because of lack of room where the salesrooms are located. The salesrooms are on a corner, which feature alone is an asset. In addition, the company handles Mack trucks, a number of which are, like the pleasure cars, paving the pathway to more sales.

Lubricating the Worm Gear Drive.

The lubrication of worm gearing always has constituted more or less of a problem, and the best way to solve it, according to the inventor of the Lanchester type of worm, is to use a mixture of nearly equal parts of castor oil, sperm oil and lard oil. "The advantage of mixing them," he says, "is to get the physical properties suitable for the occasion. Thus, where leakage is important an oil like lard oil with a tendency to solidify when not in use may be advantageous, or for the same reason, a highly viscid oil like castor oil from its leaking less while at work may be indicated by the conditions. On the other hand, when leakage is effectually prevented, it is better to add sperm oil in order to keep the mixture constantly fluid."

Where High- and Low-Tension Differ.

The lower the voltage of an electric current the more easily it is affected by dirty contacts and the like. A high-tension current will ignore an imperfect contact and go on its way, where a low-tension current might be interrupted. So it is that primary currents are easily insulated but are prone to suffer from unclean connections, while high-tension or secondary currents not only will break through films of oxide or other foreign substances, but will go through insulation also if there is half an opportunity.

Gaskets That Must Be "Punctured."

In fitting new gaskets to an engine it is well to remember that water or gas will not pass through the material; which is to say, the holes in the center should be cut out. And even if the advice does sound foolish to the experienced repairman, there have been cases aplenty where uncut gaskets have been fitted and a worried half hour spent in discovering the fault.

ELECTRICAL CONTROL OF GASOLENE AUTOMOBILES

What May Be Done as a Logical Sequence of What Already Has Been Done—Growth of Electrical Control From Nothing to Gearshifting—Future Possibilities; Cars Without Levers, Controlled by Switches.

No one can tell, from the way a thing begins, how it will end. No one can guess, from the direction of a growth at the start, what the direction will be in future years. No one, least of all, perhaps, those most interested can predict with any degree of certainty how given results may be brought about. Even after the flitting past of a decade, regardless of the seeming permanency of such results.

Increasing scientific knowledge, improvements that inevitably follow in the wake of science, new discoveries and inventions, help to turn topsy-turvy prognostications based on existing conditions, regardless of future possibilities. Especially is this true of the development of a highly complex, highly specialized mechanism, such as the automobile is—a machine which includes, in its compact assemblage, so many of the best results of years of invention and specialization. For while it is true that, so far as control is concerned, the automobile has been simplified to such a degree that almost anyone can learn to handle it satisfactorily, the fact of its complexity remains and that complexity has led to developments in directions probably utterly unthought of by pioneers.

Earlier Cars Entirely Unelectrical.

Electrical equipment was wholly missing even on the best of the earlier cars. Even ignition was accomplished without the aid of the mysterious fluid, the requisite heat for ignition of the charges being supplied by the old-time hot tube apparatus, which had been brought to a state of considerable efficiency in stationary engines. Electric ignition had to fight its way against the elusive nature of the currents as well exemplified in the first crude electric ignition installations, and criticism that was not only harsh, but in a measure justified by the then freakish antics of the extraordinary device, was the order of the day. A conviction that they were fundamentally right, coupled with the superior results obtained when electricity could be made to do the work, caused the advocates of electric ignition to persevere—and everyone knows the result. Ten years ago there were costly motor cars in the United States with a hissing lamp and a glowing plug on each cylinder. To-day there are few owners of cars who have seen a hot-tube machine.

While the single fact that the electric ignition system stands alone in its own little world it is significant in itself, in that it brings out the truth that the fittest is bound to survive, it is even more important in that it is the starting point of a series of developments based upon the use of electricity as a tractable servant.

Many Devices not Yet Wholly Developed.

Probably few have thought much of it; but a little thinking backward will serve to bring to the minds of many who have watched the automobile grow the fact that electricity has been made to do, either experimentally or in a commercially practical way, many things about the car that either were done, or still are done, by other means. Illumination was an early and logical development, though it has taken some time to evolve the modern systems with complete automatic power plants—veritable little "central stations" with all requisites for practical operation.

The story of the electric starter is still in the telling, and the electric gear-shifting system still is so new that, though adopted as standard equipment on several well-known cars, it is almost unknown, so far as the mass of car users is concerned. Electrically operated horns are commonplace, and electrically operated speedometers are in use on thousands of machines. Electricity supplies heat for hand and foot warmers, for raising the temperature of the carbureting system to facilitate starting, to assist in vaporizing the heavier fuels, for operating vulcanizers.

Electrification of Cams and Brakes.

The magnets or oslenoids in electric gear-shifting systems have been applied, tentatively at least, to the work of braking and of operating the clutch, while smaller magnets have been arranged to work the motor valves, the camshaft and its cams being replaced by a rotating contact-maker which distributed current to the valve magnets in proper sequence.

Electricity has been pressed into service as a means of transmitting the power of the gasolene motor to the rear wheels, and various forms of apparatus have been designed for this purpose, varying from a motor and dynamo set delivering current to the electric motors driving direct to the rear wheels, to a highly ingenious system in which the magnetic drag of the field, attached to the driving member, caused the armature, attached to the driven or rear wheel system, to rotate. In short, it is difficult to think of any application of electricity to the automobile that has not been attempted.

The point, however, is not so much that things have been attempted as that they actually have been done more or less successfully; the fact that some have been tried and found wanting has little or no bearing on the question, any more than has the fact that electric ignition was found sadly wanting at first, or that the first electric starters and the first electric gear-shifting devices were of very little use, commercially speaking. It is commonly said, with regard to the gasolene motor, that if there is a proper mixture, a hot spark and good compression, the motor must run. The same principle holds good with regard to electrical apparatus. If there is the proper current, adequately insulated, and the conditions are normal, electricity unfailingly will do its work.

"Elusiveness" Often Source of Trouble.

But the very fact that electricity is so easily directed—that literally the touch of a button suffices to control energy amounting to many horsepower—is the beginning of trouble. Electricity is very commonly and very accurately described as being "elusive," and if the conditions are not what they should be the current goes wrong as readily as not. It has taken years to learn how to make insulation; how to make switches that can be depended upon to make good, clean contact at all times; to get the most out of a given quantity of iron and wire traversed by a current of given energy. A single defective contact in an electrical system may make the whole apparatus inoperative, and a single leak may rob it of its power. And these two things—the certain establishment of proper contact at the proper time, and the keeping of currents to the designed paths—have by their simplicity been stumbling-blocks in the use of the comparatively mild currents employed in automobile work.

Digitized by Google

What will be the outcome of the present activity in the development of electrically operated auxiliary apparatus on automobiles remains to be seen, but there is a good deal that seems logically certain. In many cars electricity has assumed the whole burden of starting the motor, to say nothing of the more commonplace ignition and lighting service; it is depended upon absolutely to sound warning signals, to operate speedometers and now to shift gears—a task which is of such importance that the failure of the apparatus to function normally might lead to the most serious consequences. There seems no good reason why it should not be made to perform still further service. A certain amount of brute strength is required for the operation of the brakes and the clutch. Electricity has been applied to both these tasks with results that were no worse than the early results obtained in the use of electric starting and other systems, and the present knowledge of the art should be sufficient to cope with the problems involved in working brakes and clutch electrically.

The mere fact that a considerable number of magnets or solenoids may be required makes no difference, if all are reliable in operation, any more than the fact that six or eight cylinders are used in a motor makes it unreliable. Adding units cannot add trouble if the units themselves do not make trouble. If it is possible to build an electrical controlling apparatus that will work unfailingly in one place, the same principles can be applied in other places.

Dream of "Complete Electrical Control."

There now are cars running in which electricity is employed for lighting lamps, starting the motor, igniting its charges, sounding the horn, operating the speedometer and, finally, shifting the gears—and no trouble is experienced or looked for under ordinary conditions. It is not, then, going much further to conjure up the automobile of the near future, in which one of the important features will be "electrical control throughout." In fact, the expression "conjure up" smacks too much of the imagination, perhaps, for it seems not improbable that complete electrical control will not be long in coming. For that matter, it is not by any means impossible that cars embodying such features already are on the road, or at least on the boards of designers, for such things take form and have existence long before others than those closely connected with their creation and evolution have any idea of their existence.

It seems probable from the present trend in the use of electrical apparatus that complete electrical control will include a switchboard or keyboard within the circle of the steering wheel rim, carried as are the controllers of existing lighting, starting and gearshifting systems; possibly foot buttons will be employed for braking, though whether the "cleaning up" of the floor will be better than a division of labor doubtless will have to be decided by actual experience. A perfectly practical braking control would include a small controller lever, operated, say, by the thumb, and having a range of movement of perhaps two inches; the first half-inch would energize the clutch magnets and throw out the clutch, an automatic governor at the same time curbing the tendency of the engine to race. Further movement of the controller would increase the pressure on the service brakes, and then throw in the emergency brakes. A quick sweep of the lever would throw the clutch out and both brakes into action exactly as if both pedals were pressed in a car in which the service brake and clutch were interlocked.

How the Clutch Could be Electrified.

The clutch could easily be separately operated by a separate button, with only the addition of a little more wiring. The disablement of the service brake from any cause would mean merely that the lever would have to be carried over to the emergency position. One of the beauties of an electrical system is that many modifications of these arrangements are possible without any increase in complication.

It does not seem as if anything could be gained by electrical control of the accelerator, auxiliary air or ignition; but electrical governing of the motor under certain conditions might be very useful, such, as already mentioned, as when throwing out the clutch. Again, the racing of the motor immediately after starting could be checked. These things could be, and are, done mechanically, however, and it is in the handling of heavier work that the electrical idea seems to hold the most promise. Electrical steering gear is not merely a possibility, but a thing that has been developed to a certain degree and, though successful so far as actual working was concerned, and entirely reliable, was not "worth the candle," figuratively speaking.

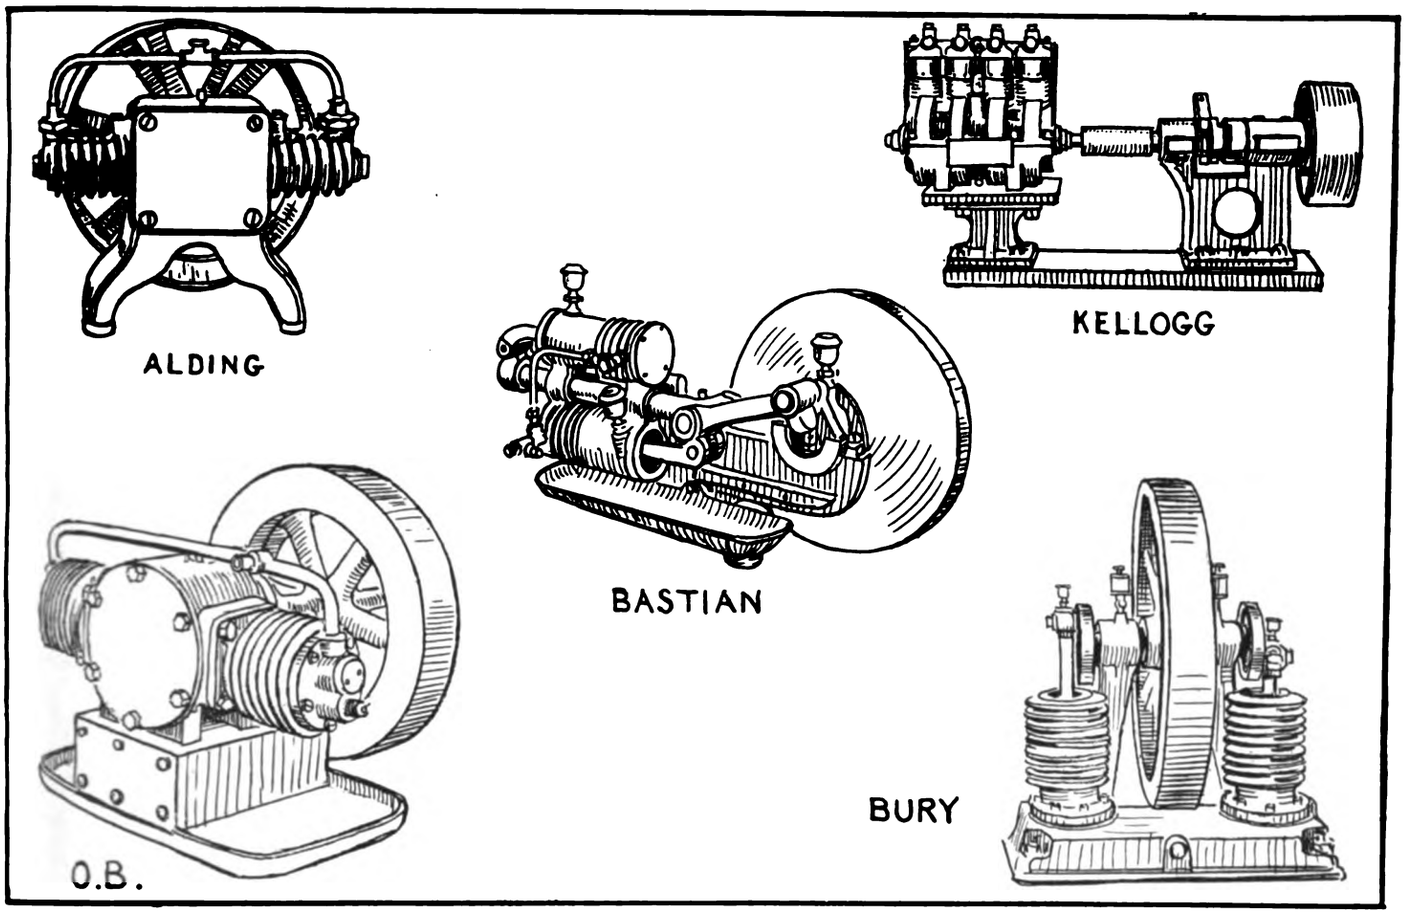
Driving Then Easy and a Pleasure.

There certainly is much that is attractive in the idea of driving a car that is fitted with "complete electrical control." The driver sits at his ease and does no more arduous work than is involved in the handling of the steering gear. Gear-shifting is reduced to the mere pressing of a button, and even this may be half done in advance by pressing the button of the next gear that will be required and, when the time to change arrives, merely pressing the clutch button to make the actual change. Approaching a sharp turn and with the car at speed, all the work is done with one thumb; the clutch is thrown out, the service brake applied with a force that is dependent upon the swing of the little lever, and the automatic governor takes care of the motor while the clutch is out. If the motor stalls, there is a button to press which instantly starts it. If the motor is unable to run, or if fuel is exhausted, the starting motor will propel the car for a considerable distance—far enough, say, to find help or fuel or a place for the car.

Incidentally, the storage battery will be an important part of the "complete electrical control" and, while it doubtless will be found advisable to make it somewhat more capacious than the starting and lighting batteries now in use, it can be so amplified without greatly increasing its weight—and in any case 150 pounds or so is very little to an average car and a great deal in a battery. Moreover, batteries are improving every day, growing more efficient and powerful, pound for pound, and it is safe to say that trouble from this source is quite unlikely.

Lessening Work Popularizes the Car.

Complete electrical control seems certain as a development of the near future, for if a man does not want to crank his motor, or change his gears, neither does he desire to pull at his brake levers or kick his clutch out. There are those who declare that they would not care to drive a car in which there was "nothing to do"; but the fact remains that the less there is for a driver to do the more people will drive cars and buy cars, and for every one who wants to "do something" when driving there are ten who will be attracted by the simplicity and foolproofness of the controlling system that eliminates so many possibilities of human error.



Kohl to Undertake Globe-Girdling.

Over two exactly opposite and very different routes, three Henderson cars will be started for San Francisco on July 1st, two of them in the hands of R. P. Henderson and Ray Harroun, respectively, going west with the Indiana "boosters," and requiring 26 days to make the trip, and the third, under the guidance of Edwin P. Kohl, heading eastward on a globe-girdling undertaking that will occupy two years. Kohl hopes to reach the Pacific Coast in time for the Panama-Pacific exposition in 1915. The two cars that are to be driven by Henderson and Harroun are touring models and will make the journey on kerosene with the aid of Harroun's kerosene carburetter. Kohl's car is a roadster and will be run on gasolene.

TAKING GARAGE DIVIDENDS OUT OF FREE AIR

How One Man Increased His Business and the Satisfaction of His Patrons With the Aid of a Small Compressor—Variety Revealed by a Study of Power-Driven Air Pumps—One and Two Cylinders Contrasted.

FIVE TYPES OF MULTI-CYLINDER COMPRESSORS SUITABLE FOR THE AVERAGE GARAGE

y Rea was—and still is, for that mat- the proprietor of a successful garage. ccess is dependent upon a whole of circumstances, and the keynote of is that his customers are satisfied cus- rs

y are satisfied because they get good Cars are washed and brass and is polished, as should be done—as ner himself would do it if he could ord to pay some one else to do it Rea keeps a small but complete of such supplies as are in most de- and he keeps his customers in good by retailing them at the prices asked for them by supply stores. he one thing that seems to please his mers most is that they have consider- ess tire trouble than do the custom- any number of garages within a of several miles. And they ascribe reason for the absence of blow-outs and uts and bruises to Rea himself.

Rea is an analytical sort of a chap, which probably is one reason his garage keeps a roof over his head, pays his wife's bills and takes the childer to the seashore for the summer. He sought some way to tickle his customers, to make them feel that he, Rea, was looking after their personal welfare and after quite a little thought he discovered the answer to the problem.

Tire Trouble Source of Inspiration.

He figured that the average motorist has more trouble with his tires than he has with any other part of his car; he figured, further, that the trouble was not with the tires themselves, for tires as they are made at present are a great deal better than ever they were before. Ergo: The trouble must be up to the owner. And as no one can prescribe the way a person shall drive a car in order to save his tires and expect the instructions to be carried out, he decided that the best way out of the difficulty was to do something to the tires that would make them more resistant to abuse. And he found, as many another person has found, that the best way to save tires is to keep them well inflated. So far, so good.

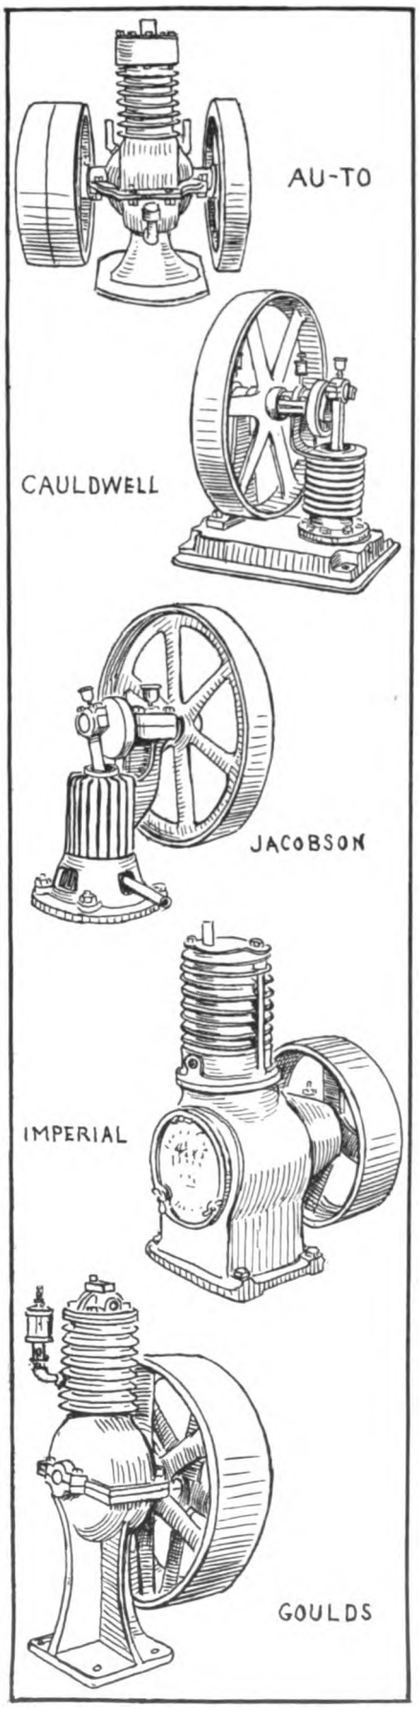
Rea's shop, in common with a great many other shops, is comparatively complete. Which is to say, it is equipped to turn out a limited amount of machine work. There is a lathe and a shaper, a power drill press and a power hacksaw, all operated from a small electric motor slung up under the rafters and driving through an overhead shaft that runs the length of the shop. Hence, it was comparatively simple for him to provide for the proper inflation of tires.

He purchased a small single cylinder air compressor and a storage tank and belted the compressor to the overhead shaft. Then he called the attention of his customers to the fact that the installation was complete and invited them to make free use of it; he encouraged them to hitch the air hose

Digitized by Google

to the valves of their tires every day before they went out on the road; he had a couple of big signs made setting forth the advantages of proper tire inflation, and these he posted near the door, where every one passing out could see them—could not fail to see them.

Benefits from a Small Initial Outlay.



The whole installation did not cost more than $100; it cost him practically nothing to run, for as long as repair work was in progress the electric motor must run and the air compressor ran, too, as a matter of course. It required very little power. Of course, it was not necessary for it to run all the time. In the morning it was started up and run for half an hour or so to fill the storage tank, and then it was shut down until the pressure in the tank dropped. Just before closing time at night, the compressor was hitched up for a short time and the tank filled, and as there were few calls for air during the night, it never was necessary for the night man to start the compressor.

The ultimate result of the investment was that Rea's customers got more real service out of their tires then they ever got before. Because the tires were properly inflated, blow-outs were practically eliminated and rim cuts disappeared altogether; Rea's good will increased immeasurably, and today he is the most successful garage proprietor in his vicinity. And it can all be traced directly to the installation of the compressor—a nifty little single-cylinder device that cost him just $35.

Variety that Obtains in Compressors.

In choosing the compressor, Reo spent more than an hour in conning over a score of catalogs received in answer to inquiries sent to manufacturers; he was surprised—and probably most other persons would be surprised, too—at the great variety from which he had to choose. He found compressors large and compressors small, some of them air cooled and some of them water cooled, some with one cylinder, some with two cylinders and some with four cylinders. In the end he chose a single-cylinder air-cooled compressor, for he figured that as it was not for continuous service water cooling was not necessary, and that as his garage was not an exceptionally large one a single-cylinder pump would be large enough for his purpose. Many of the manufacturers, he found, make any number of types of compressors, both air and water cooled, some of them cheaper than the one he purchased and some of them more expensive.

The one he chose is suitable for any number of medium-sized garages, as are any of the others that are illustrated and described herewith; obviously, not all those manufactured are illustrated, for to do so would require a great deal of white paper and ink. Those that are illustrated have been picked out from among a great many because of their low cost, simplicity and suitability for the average garage. They embrace one-, two- and four-cylinder outfits and all of them are air cooled; hence they may be installed almost anywhere, the only piping required being that used to convey the air.

VARIETY IN ONE-CYLINDER PUMPS

Simplicity of Construction a Feature.

The power required to drive any of the single-cylinder compressors illustrated is small; it seldom exceeds one horsepower per 100 pounds pressure, and 100 pounds pressure is plenty; capacity is determined by the speed of the pump or the size of the storage tank. In many cases the tank may be dispensed with and the compressor used direct. In construction they are simple and automatic and, save for occasionally oiling, they never require attention from one season's end to the next.

The simplicity of construction that is possible is made very plain in both the Spacke, which is made by the F. W. Spacke Machine Co., of Indianapolis, and the Caldwell, which is made by the Chicago Pneumatic Tool Co., of Chicago, Ill.; in both of them the floor space required is negligible, and this is particularly noticeable in the Spacke, which can be mounted on a bench, if necessary. Both of them—and all the others, for that matter—are designed to be run by belt and, where desired, a tight and loose pulley can be supplied. The Spacke cylinder measures 3 x 5, and the working pressure is calculated at 125 pounds to the square inch, and the Caldwell cylinder measures 3½ x 4 inches with a working pressure of 200 pounds; both of them are made in several sizes, these being the smallest that are made. The power required to operate either of them at full load does not exceed one horsepower.

Characteristics of Air-Cooled Cylinders.

With regard to air cooling for compressors, experience has proven that for comparatively low pressure—up to 250 pounds—excessive overheating will not take place on continuous runs up to 15 hours or more, and where the compressor is placed in such a position that a draft of air blows on it continuous service without overheating often can be pushed to a much greater length of time. For higher pressures and more continuous service, water-cooled cylinders are to be preferred.

In some cases, to facilitate cooling, the flywheel or pulley spokes are made in the form of fan blades, this construction being followed by the Curtis Mfg. Co., of St. Louis, which produces Curtis compressors in a number of styles and sizes. In the type illustrated, the bore and stroke are 2 and 2½ inches, respectively, and up to 250 pounds pressure only one-half horsepower is required. The speed is 350 revolutions a

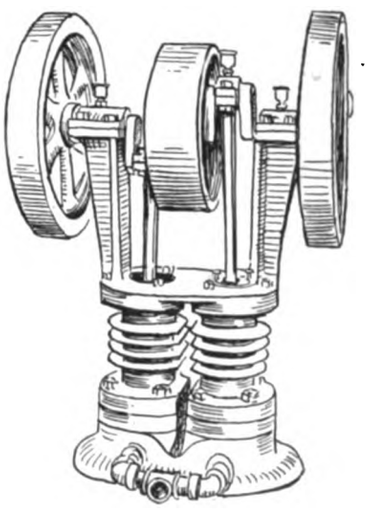
GARAGE HORIZONTAL CYLINDER

at 200 revolutions a minute the discharge is 3½ cubic feet of air a minute. The power required to operate it is one horsepower per 100 pounds pressure. To permit the compressor to be operated by hand, the flywheel is fitted with a handle.

The Garage single-cylinder air compressor, which is made by the Standard Pattern & Mfg. Co., of Richmond, Ind., differs from any of the others, principally in that its cylinder is horizontal; it is equipped with a very heavy flywheel to obtain steadiness in running and eliminate "flapping" of the driving belt and is otherwise distinctive by reason of the fact that it is equipped with an "unloader," the office of which is to regulate the valves so that when the tank



CURTIS COMPRESSOR

is filled to a predetermined pressure, the compressor requires no power to drive and simply runs idle. The cylinder dimensions are 3⅛ x 4 and at 250 revolutions the capacity is 4½ cubic feet of free air per minute, from ¾ to one horsepower being required to obtain up to 150 pounds pressure.

The single cylinder air compressor undoubtedly is the simplest air compressing device, and where the demands made upon it are not too great it can be expected to perform indefinitely without trouble and to furnish a supply of compressed air adequate for the moderate sized garage where the air is used for tire inflation alone. But for large garages, where the demand for air is considerably greater, as when air is used for cleaning, for instance, as well as for tire inflation, it is likely that a twin-cylinder pump operating at fairly low speed would be much more satisfactory than one having only one cylinder and operated at a higher speed than it normally is constructed for. In pumps of the kind there is quite as much variety as there is in those of the single-cylinder type.

Advantages of Two-Cylinder Types.

In several respects, the employment of two cylinders instead of one has advan-

AU-TO TWIN COMPRESSOR

tages over single-cylinder construction. Outside of the fact that two cylinders supply twice the volume of air as does one, they permit better balancing and the air is discharged in a constant stream with very little intermittancy. Intermittancy, of course, can be overcome with a single-cylinder compressor by the addition of a small storage tank and is of little moment anyway where the air is used for tire inflation alone. But where the air is used for cleaning purposes and no room can be found for a reservoir, the multi-cylinder pump has advantages over the single-cylinder pump.

In both the O. B. compressor and the Alding, the former being made by the Universal Mfg. Co., of Minneapolis, Minn., and the latter by the Cast Iron Brazing & Mfg. Co., of Manchester, N. H., the cylinders are opposed, thus providing for good balance and somewhat reducing the overall size of the machines. The O. B. pump delivers four cubic feet of free air a minute at 200 revolutions a minute and requires one

Digitized by Google

horsepower to operate at that speed. The capacity of the Alding compressor is 200 pounds at 250 revolutions, two horsepower being required to drive it. Both are internally lubricated and are designed to operate for long periods without attention.

Accessibility of Valves Essential.

The Bury compressor, which is produced in several styles and sizes by the Bury compressor Co., of Erie, Pa., differs from any of the others in that its cylinders are vertical with the combined driving pulley and flywheel in the center. The size illustrated has cylinders measuring 3½ x 4 inches and delivers four cubic feet of free air per minute at 200 revolutions a minute; from three-quarters to one horsepower is required to drive it. The capacity of the pump is 200 pounds to the square inch.

The Au-To compressor, made by the Au-To Compressor Co., of Wilmington, Ohio, also has its cylinders vertically placed, though its construction is quite different from that of the Bury, as may be seen by reference to the accompanying illustrations. The Au-To has two flywheels, one at either end of the crankshaft, with the driving pulley in the center. The valves are contained in plates between the cylinders and the base plate and are easily accessible without the necessity for breaking air connections. Another distinctive feature of the Au-To is that each piston has an oil reservoir in it from which the cylinders and wristpins are lubricated. The air inlet is comparatively high up, so that there is no danger of dust and dirt from the floor being drawn into the cylinders and later forced into tires. The cylinders measure 2½ x 4 inches, and at 300 revolutions a minute the capacity is 6.8 cubic feet of free air a minute; two horsepower is required to operate the pump against maximum pressure of 200 pounds, less than half that being required, of course, when pumping 75 pound pressure, which is all that is needed for operation under ordinary conditions.

Quick Acting Twin Cylinder Pump.

In the Bastian compressor, which is produced by the General Utility Co., of Philadelphia, Pa., there is a still different arrangement of the two cylinders, one being placed horizontally directly over the other; the arrangement is best made plain with the aid of the accompanying illustration. One unusual feature of the pump is that all its moving parts, with the exception of the pistons, of course, are mounted in ball bearings, thus reducing friction to the minimum. The pump illustrated is known as style B and is driven direct by belting over the flywheel. In a larger size, styled model L, tight and loose pulleys are provided and there is a gear reduction between the driving pulley and the crankshaft which permits the driving pulley to operate at 1,600 revolutions a minute and cuts the compressor speed down to 350 revolutions. With the larger pump, it is pointed out by the manufacturers, a 300-gallon tank can be filled to 150 pounds pressure in a very short time and at a minimum expense for power.

Kellogg compressors are well known, of course, for the Kellogg Mfg. Co., of Rochester, N. Y., has been supplying small air pumps for standard equipment on automobiles so long that there are few persons who are not familiar with them. Incidentally, they are the only four-cylinder pumps on the market. Suffice it to say, therefore, that the outfit illustrated herewith consists essentially of the standard Kellogg four-cylinder air compressor arranged on a base with a clutch and a driving pulley for garage service. One of the latest improvements in the design of the pump itself is the incorporation of double check valves in the cylinder heads so that if the valve of one cylinder becomes clogged through any cause the other three cylinders will perform the work of all four.

Kellogg Four-Cylinder Outfit Light.

The whole Kellogg outfit undoubtedly is the lightest of all those described, and for this reason it has the advantage that it can be located on a bench or on a shelf out of the way, where it can be operated as needed by means of a long lever to the clutch control. Though the pump is air cooled, for heavy duty work, a slightly different style having a small water jacket at the tops of the cylinders is supplied; water circulation is effected on the thermo-siphonic system, and as lubrication is automatically carried on by the movements of the pistons, the pump requires the minimum of attention. By reason of the use of four cylinders the delivery of air is constant and a storage tank therefore is unnecessary, except for emergency use when driving power is not available.

What Constitutes "Innocent Sports"?

Whether automobiling is as innocent a sport as bicycling is a question at issue in an action instituted in the Supreme Court of Texas, sitting in Austin, wherein an order of mandamus is sought to compel Secretary of State John L. Wortham to grant papers of incorporation to the Dallas Automobile Club Building Association of Dallas under that section of the incorporation law which provides for the incorporation of "bicycle clubs and such other innocent sports"; the attorney general has held that "such other innocent sports" means those kindred to or affiliated with bicycling, his decision resulting from the questioning of the secretary of State's attitude in refusing a charter to the building association.

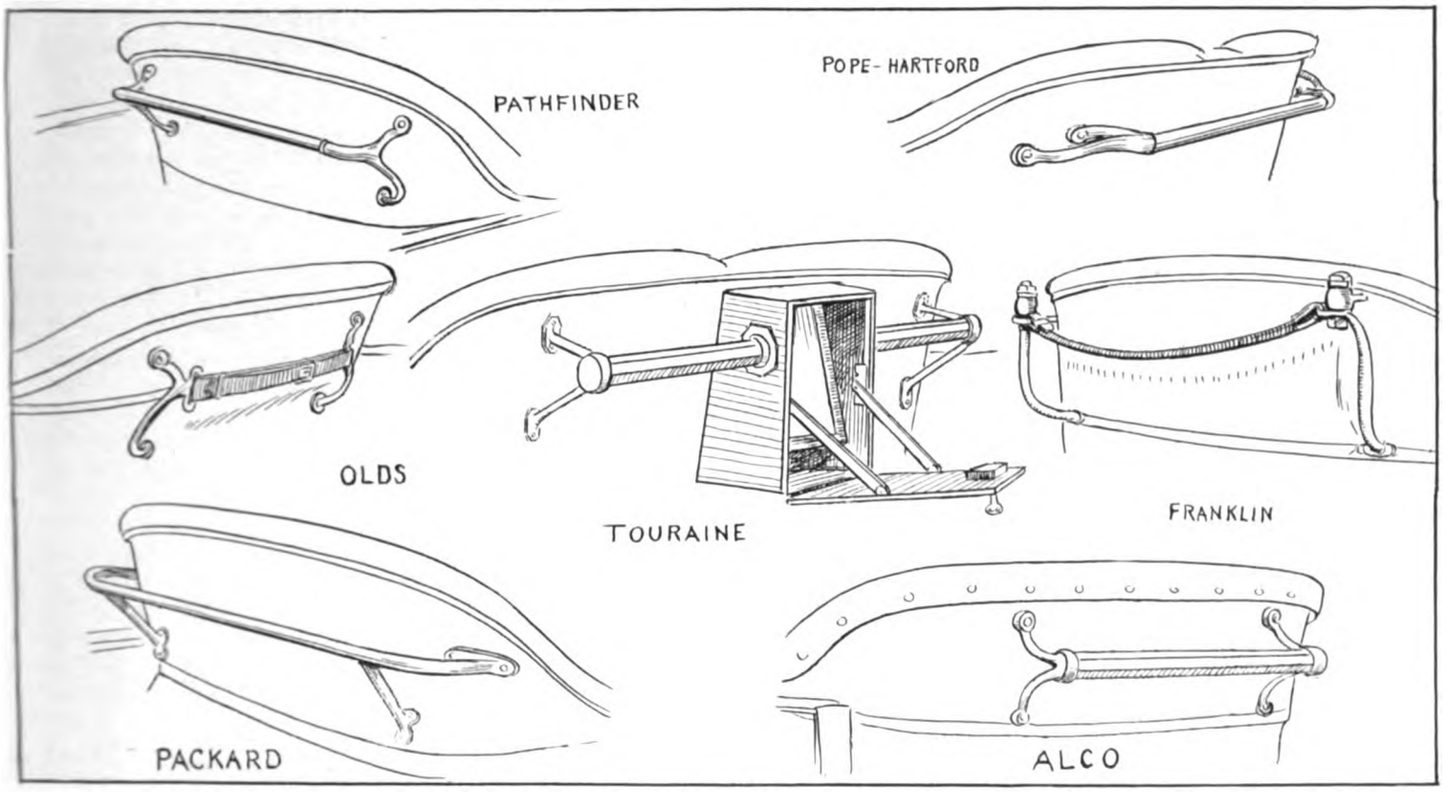
The charter for the building association was asked for by P. G. Keene, F. M. Smith and Samuel A. Leake, of Dallas, and while its members are mostly members of the Dallas Automobile Club, the building association is intended to be a separate organization. A site for a clubhouse for the automobile club has been secured and the incorporation of the building organization was sought as a preliminary to the construction of the building. The outcome of the litigation will affect a number of applications for charters, six baseball clubs now being held up.

Overman 10,000-Mile Tire Test Completed.

By way of demonstrating the ability of Overman cushion tires to withstand the abuse to which tires ordinarily are subjected by the average driver, the Overman Tire Co., of 250 West 54th street, New York City, submitted a set to be tested by the testing laboratory of the Automobile Club of America, and after 97 days' running two of them remained in good condition with 10,017 miles to their credit; two ran 7,275 and 8,995 miles, respectively, before they required displacement. The car on which the tires were tested was a National touring car weighing when empty 4,300 pounds, and the test was made over roads within a radius of 50 miles of New York City, the daily average mileage being 105.4.

The two tires with the greatest mileage to their credit were on the front wheels and were interchanged at the end of 7,572 miles. Of the two rear tires, the left was replaced at the end of 7,275 miles, the body being torn loose from the bead for about one-sixth of the circumference, and the right was replaced at the end of 8,995 miles, the body being torn from the bead for about one-fifth of the circumference. The total running time of the car was 495 hours and the average speed 20.2 miles an hour; on several occasions a speed of 50 miles an hour was attained. During the test, the left rear tire lost 13.3 pounds in weight, the right rear lost 17.1 pounds, the right front lost 13.4 pounds and the left front lost 15.9 pounds. The consumption of gasolene for the entire test was approximately 943 gallons, about 10.6 miles per gallon.

Habit that is Well Worth Acquiring.



Despite the fact that a well-built electric lighting and starting system gives little trouble, it is important that the devices provided by the manufacturer to indicate derangement should be watched. It is almost as easy to form the habit of looking at indicators as it is to form the habit of ignoring them, and, to twist the old proverb, a glance in time saves dollars.

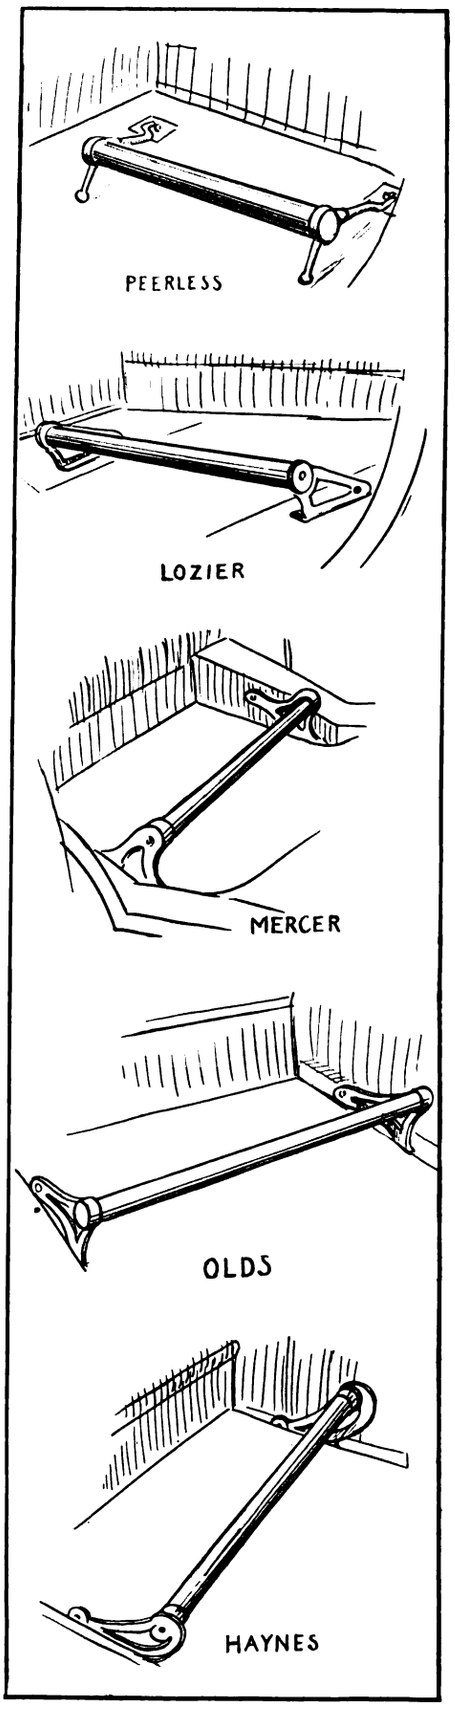
RESTS FOR THE FEET AND RAILS FOR THE ROBES

Little Differences in Seldom Thought of Accessories That Add to Comfort or the Other Thing—Strong Points and Divergent Features of Rests and Rails Employed on American Cars—Minor Details That Appeal.

There must be, in the journeyings of all cars, times when the roads are rough and the going more or less bumpy. No machine escapes it, for even if smoothly-paved asphalt streets are adhered to, there are the

SEVEN TYPES OF ROBE RAILS SHOWING SIMPLE DESIGNS AND ONE THAT IS UNUSUAL

inevitable bad spots. And however well the car may be sprung, and however it may be provided with shock absorbers, buffers and the like, there must come times when the passengers in the tonneau are more or less jostled and when they feel that their comfort is preserved, even that they have been saved from being deposited on the floor, by the foot-rests which enable them to brace themselves against shocks. In fact, it is by no means difficult for any thinking person who has had a little experience in the rear seats of a car to figure out that on many occasions the tonneau would be a much more uncomfortable place than it is if the foot-rests were absent.



Robe-rails fall naturally in the same class with foot-rests—not because of the occasional tendency on the part of frivolous passengers to elevate their pedal extremities and rest them on the robe-rail, but because both are conveniences that, while simple and rarely given much though by those who use them, would be sadly missed if omitted. It is not putting it too strongly to say that frequently the foot-rests and robe-rails make all the difference between positive comfort and absolute unhappiness. It is only necessary to conjure up in one's imagination a car, without these humble accessories, loaded with passengers with their hands full of wraps endeavoring to stick to their seats while the machine bounds over a hummocky highway.

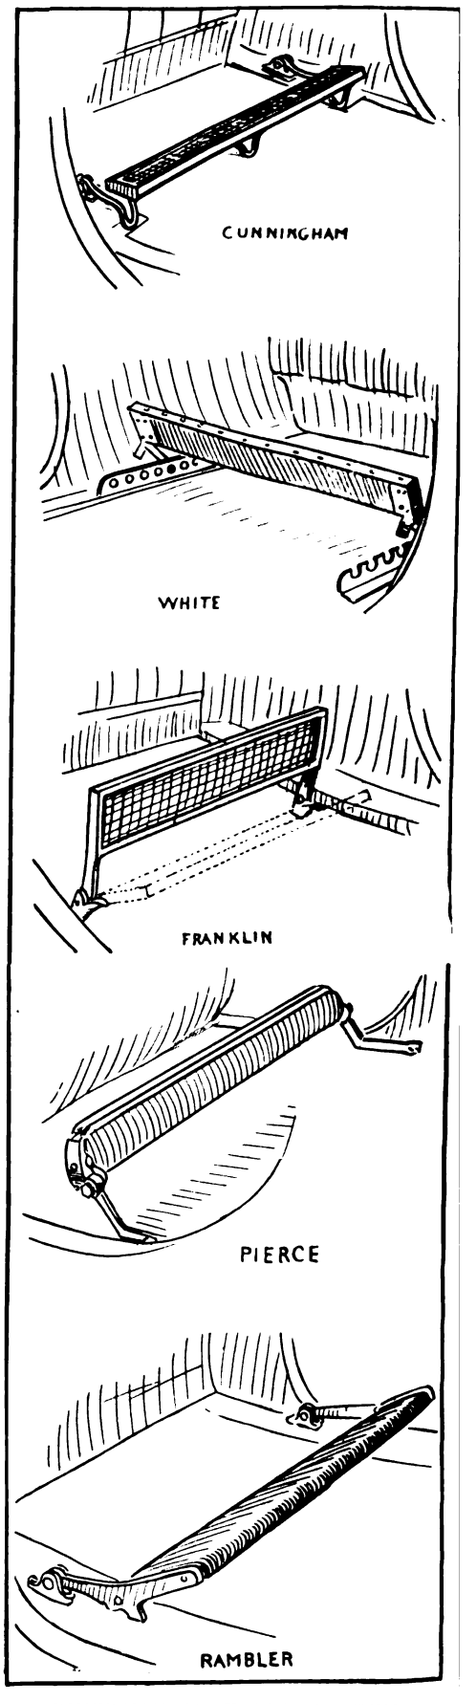
What Study of Problem Accomplishes.

While in the nature of things there is not much opportunity for variety in the arrangement of rails and rests, there is sufficient difference to indicate that most manufacturers have taken a real interest in the matter, and in some cases have gone to a good deal of trouble to produce fittings that are worth while. In the White touring car, for instance, full cognizance is taken of the fact that there is a lot of difference in the lengths of passengers' legs, and that a foot-rest that will make a tall person quite comfortable may be practically out of reach of a short passenger. Therefore, the rest is made adjustable as to its distance from the seat. Two brackets are secured to the tonneau floor, close to opposite sides; one is drilled with seven holes and the other has seven slots at exactly the same intervals. The supports at the ends of the rest are fitted with projections or pivots pointing inward, or away from the tonneau walls.

The process of putting the rest in position, supposing it to be detached, is to hook the projection on the perforated bracket side into the hole that is at the desired distance from the seat and then allow the opposite projection to drop into the corresponding slot on the other bracket, which cannot be done until the first is properly in place. The rest then falls forward and is supported at a convenient angle by legs which rest on the upper surfaces of the brackets. In swinging forward the pro-

Digitized by Google

FIVE TYPES OF ROUND RESTS



jection on the slotted bracket locks itself in place and the rest cannot be detached until it is swung into a nearly upright position. The foot-rest proper provides a broad, comfortable usrface for the feet to rest upon and adds materially to the passengers' ease.

The same ample "bearing surface" is provided in the foot-rests found in the Franklin, Pierce, Cunningham and Rambler cars, though the details differ in all these cases, and the adjusting feature is absent. The Pierce foot-rest is supported by swinging brackets bent upward and resting their angles on the floor, so that the rest-bar is held up at a comfortable height; the bar itself is mounted on pivots at each end, so that it conforms automatically to the position of the foot and by giving a chance for flexing the ankles tends to eliminate stiffness and discomfort on long rides. In the Franklin the wide rest is carried rigidly on swinging brackets that are held at the proper angle by downwardly-projecting lugs close to the swivel joints. Like practically all foot-rests, the Franklin device folds flat on the floor when tipped backward as far as it will go. The Rambler rest is of unusual width, giving an easy resting-place for the feet, and is padded. Short legs at mid-length of the brackets hold it up at the proper angle. Three legs are fitted to the Cunningham foot-rest, the two at the ends being supplemented by a third at the middle of the bar to afford ample support against the thrust of a heavy passenger. A glance at some of the disabled foot-rests in cars that have been in use for some time will indicate the importance of this provision.

Varieties of the Tubular Type.

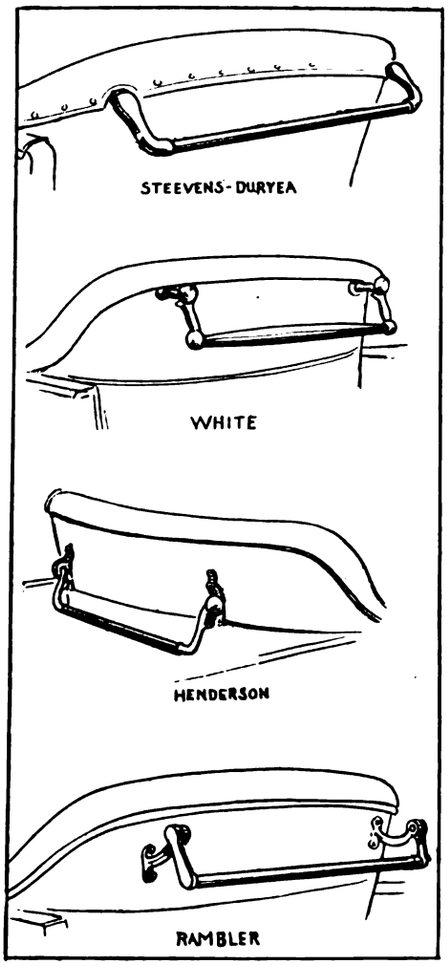
By far the greater number of foot-rests, on cars of all sorts, sizes and types, are of metal rods or tubes carried by the usual swinging side brackets with means for holding them at a fixed height from the floor. The Peerless well exemplifies this type. The cross-bar is short and stout and its two straight brackets are let into low-placed joints on the floor, while two legs, one at either end of the bar, give the desired clearance. In the Lozier the design is very similar, the only real difference being that the supporting legs are connected with the bracket bars in such a way as to make the brackets a pair of triangles; this form, incidentally, affords a long supporting base for the brackets.

The same principle is embodied in the Olds foot-rest, the brackets being substantially of triangular form; the rest itself is longer, however, extending almost to the walls of the tonneau. The Haynes also has a long foot-bar, but the bracket is given a curved form which is particularly noticeable because it lies snugly down when the rest is folded back on the car floor. The Mercer touring car has a very substantial foot-rest that is in a fixed position, rigidly supported on triangular brackets screwed to the sills at either side of the tonneau floor.

DIVERSITY IN FOLDING RESTS

The robe-rail exists for the purpose of relieving passengers of the necessity for

Digitized by Google



carrying wraps when they do not want them, of keeping robes off the floor when they are not in use and of accommodating anything that will consent to be accommodated, from an umbrella to a small parcel that can be jammed behind the rail. A virtue that every robe-rail should possess is unobtrusiveness when not in use; further, there should be no angles to catch and tear clothing. All these requirements seem to be well met by the various forms of fixed rails that are found in many makes of cars. A glance at the illustration of the Packard robe-rail shows that the simple form is the result of no little thought, for the long rod provides plenty of space, the short lower brackets give strength to support the weight of a clutching passenger, to say nothing of the legitimate load of robes and the like, while there is not an angle that gives an opportunity to catch and tear holes in people's clothes and fray their tempers. Further, the extended ends form excellent grips to be used when climbing into the tonneau—an employment which further justifies the substantial fastening methods.

Contrasts in Robe Rails.

The same absence of angles and the same extended ends to be used as hand-holds are found in the rail of the Pope-Hartford touring car, though the ends curve differently and the supporting brackets are horizontal instead of being carried downward at an angle. The Alco also goes in for simplicity, providing a rail that is supported at each end by A-shaped brackets. It is a handsome rail, let it be said, the cross-bar being of substantial proportions and made of octagonal brass tubing, highly polished.

It is impossible to refer to the robe rail of the Touraine "six" without referring also to the neat little cabinet which divides it into two sections, as the accompanying illustration shows. The rail itself is of heavy octagonal tubing with A-shaped end supports, but instead of being continuous from side to side of the car, as most rails are, there is a polished mahogany compartment in the middle of the back and the front seat, with a swinging door which drops like the front of a kodak and, supported by metal straps, forms a little table—obviously a toilet table for no other reason than that there is, in the cabinet, a mirror hung from the top and adjustable to any convenient angle. There is plenty of space inside the box for the various things that might be assumed to go along with the mirror, and a lock on the door secures the contents.

A robe-rail that is found in a number of cars, either of exactly the shape shown in the accompanying illustration or closely approximating that shape, is exemplified in the device in the Pathfinder touring car. While it is of a simple type, it is well designed in that its "angles are all curves," to use a Hibernianism, and it offers no garment-tearing projections. There are several slight variations in the finish of this type of robe-rail in different cars; for instance, the brackets may be enameled black, or some other color to match the car, and the bar covered with leather or fabric, or plated; or the whole affair may be plated, or finished

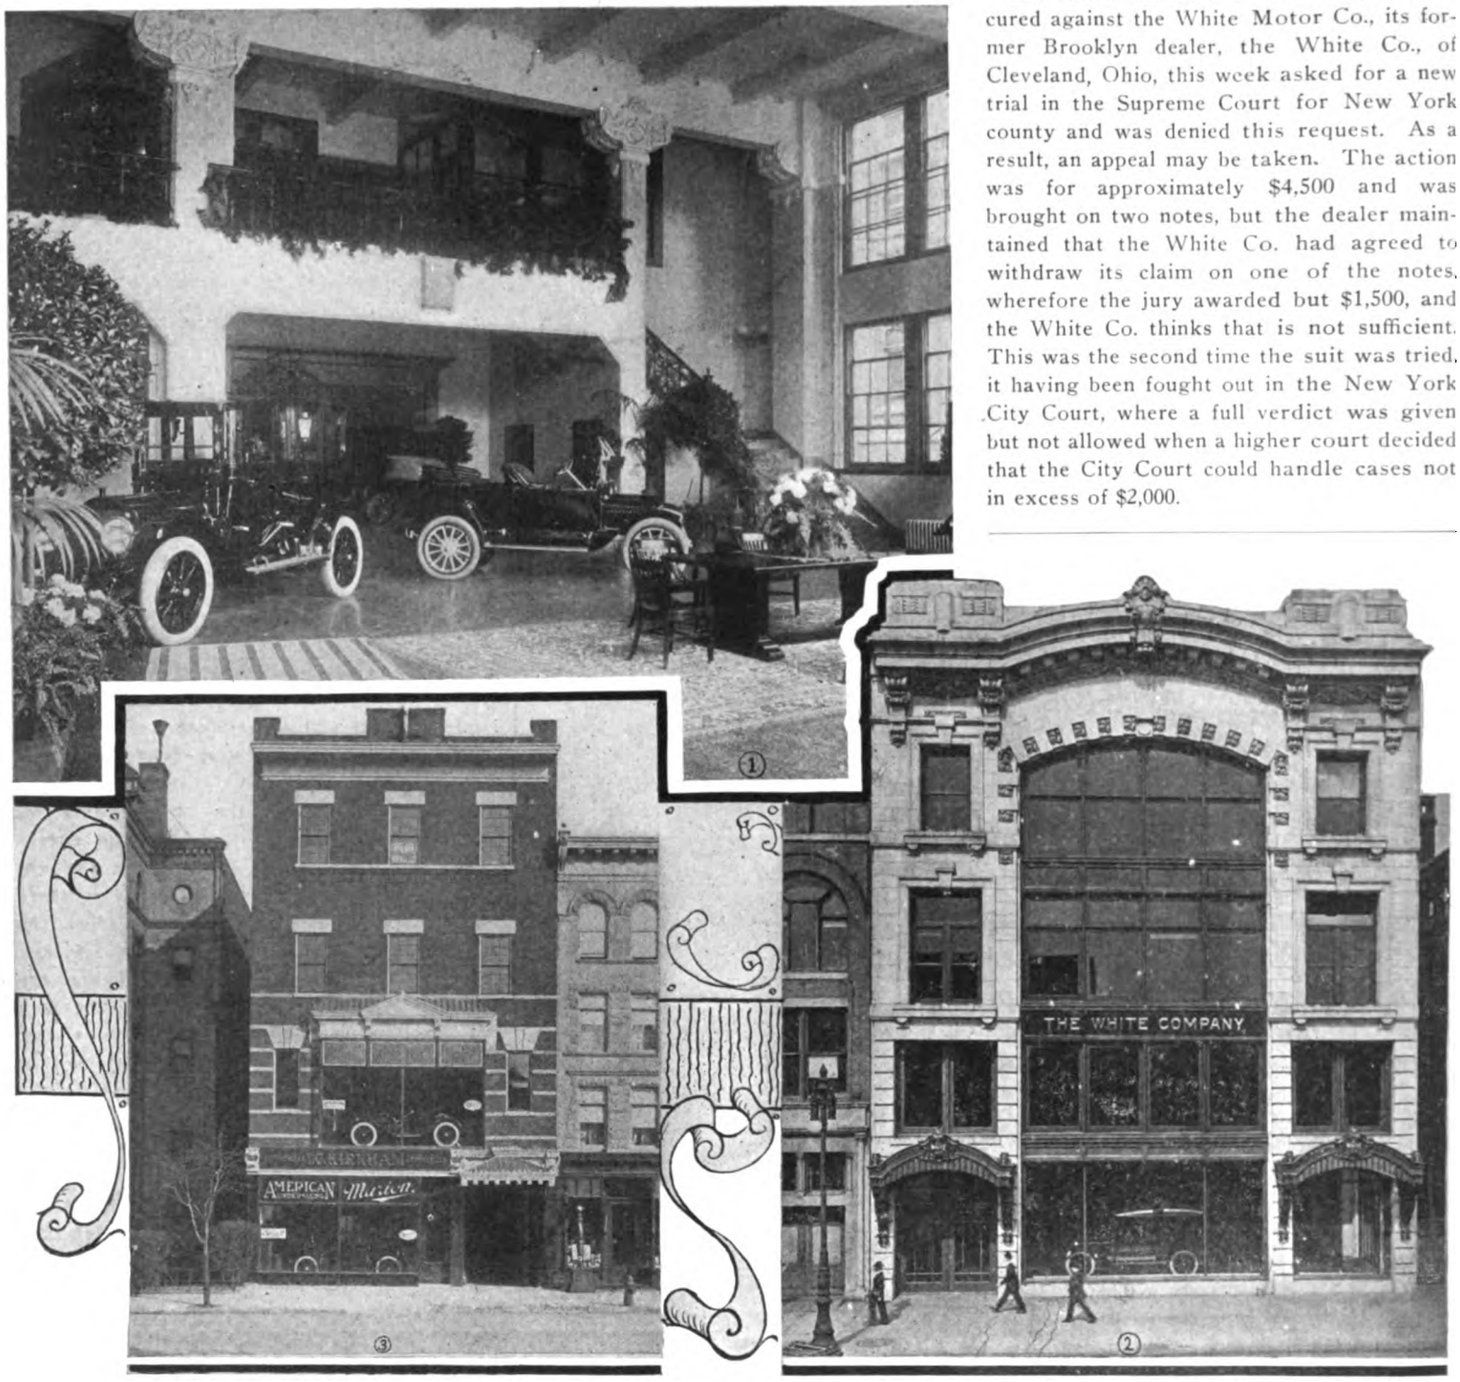
VARIETY IN ROBE RAIL CONSTRUCTION

in polished brass, and so on. The most popular finish appears to be a very quiet one, with black enameled brackets and a black leather covering for the bar.

In the Hinged Class.

There is a distinct class of robe-rails in which the brackets are hinged, so that the bar drops against the back of the front seat when it is bearing no burden, and when carrying a robe or wrap drops as far as the thickness of the stuff permits, and so economizes space. A simple, substantial rail of this class is that in the Stevens-Duryea car, which is smooth and cornerless and neat in appearance. The bulbous ends of the brackets are slotted to receive the plates which are attached to the back of the front seat and form the stationary halves of the hinges. The Henderson drop-rail has a ball-hinge effect and well-rounded corners and, perhaps, a little more depth when extended than most rails. The White rail also has the ball effect at the hinged part, but the outer corners, instead of being curved, are tipped by large, polished balls that answer the purpose of preventing things from catching and at the same time add a touch of ornateness. The cross-bar is built on scientific principles, being thicker in the middle than at the ends, giving considerable strength against unusual stresses.

Straps for Cross-Bars.



The hinged robe rail of the Rambler car is carried on brackets that extend rather more than the usual distance from the point of attachment, so that, with the brackets on the rail itself, there is an unusual depth for the accommodation of heavy robes or coats. When the rail is not in use it can be allowed to drop and hang vertically, or can be folded back.

A little separate class is formed by the robe rails of the Franklin and the Olds cars, in which the usual rigid cross-bar is missing, a stout leather strap taking its place. While in all important respects the two rails—if leather straps can be termed rails—are alike, in that the strap principle is used in both, while the end brackets are carried well downward in graceful curves to form hand-holds to facilitate the entrance of passengers to the tonneau, there are detail differences. In the Olds the strap is a conventional strap—that is to say, it is of flat leather, doubled, being run through slots in the brackets, carried back upon itself and buckled in the ordinary way, permitting the strap to be lengthened or shortened if required. In the Franklin the strap is more in the nature of a smooth, round rope of leather hooked into the end brackets. As the illustrations show, the brackets themselves are, as might be expected, different in their curves, though they serve the same purpose.

It goes without saying that there are numerous other patterns of rests for the feet and rails for robes and wraps; but practically all resemble more or less strongly those described. Though there is not a great deal of room for variety, there is plenty of opportunity to display forethought, on the part of designers, that eliminates the annoyance caused by the faulty design of a robe rail that insistently catches the clothes of the entering passenger, or of the foot-rest that is placed at an uncomfortable angle, or at the wrong distance from the seat, or that bends in the middle when the passenger of more than usual avoirdupois locates himself in the middle of the seat, plants his feet in the center of the bar and puts all his weight on it when he resists a forward pitch.

TWO AUTOMOBILE SALESROOMS OUT OF THE USUAL RUN

1 AND 2—INTERIOR AND EXTERIOR VIEWS OF THE WHITE COMPANY'S NEW SALESROOMS IN PHILADELPHIA. 3—AMERICAN-MARION SALESROOM IN BROOKLYN, N. Y.

White and Its Dealer Still at Odds.

Not satisfied with a verdict of $1,500 secured against the White Motor Co., its former Brooklyn dealer, the White Co., of Cleveland, Ohio, this week asked for a new trial in the Supreme Court for New York county and was denied this request. As a result, an appeal may be taken. The action was for approximately $4,500 and was brought on two notes, but the dealer maintained that the White Co. had agreed to withdraw its claim on one of the notes, wherefore the jury awarded but $1,500, and the White Co. thinks that is not sufficient. This was the second time the suit was tried, it having been fought out in the New York City Court, where a full verdict was given but not allowed when a higher court decided that the City Court could handle cases not in excess of $2,000.

IN THE RETAIL WORLD.

(Continued from page 12.)

burg, W. Va. He has purchased a site, 103 x 206 feet, at East Burke and South Spring streets, in the latter town, and will erect a brick garage and salesrooms. The site cost $7,500.

Authority has been granted to Herman Ablers, of Brooklyn, N. Y., to erect a garage at Lewis and Gates avenues. The estimated cost is $9,000.

W. C. Collins, formerly of Buffalo, Ia., has entered the trade in Bettendorf, in the same State. He is trading under the style Bettendorf Auto Co. and deals in new and used cars.

The George E. Goll Co., of Champaign, Ill., has taken possession of new salesrooms on North Hickory street. C. W. Wiggins is about to locate in an adjacent building. He is Cadillac dealer.

Stephen B. Jacobs, proprietor of the Dedham (Mass.) Auto Station, has secured a site at 362-364 Washington street and is about to erect a new fireproof garage, 54 x 120 feet. He handles Studebaker cars, Diamond, Goodrich and G & J Tires, Panhard oils and Prest-O-Lite tanks.

Lovell Marks has sold his interest in the Marks & Mathews Garage in Bardstown, Ky., to James Mathews, who, in turn, has disposed of a half-interest. The firm style now is Mathews, Spalding & Hurst. A new garage is to be erected on the southwest corner of the Public square.

"BOOST INDIANA" TOURISTS READY TO START BOOSTING

22 Cars to Start July 1 on 3,550-Mile Trans-Continental Trip—Hendersons to Use Kerosene—Entries and Itinerary.

Bearing a large American flag presented by Governor Ralston, and letters from him to the executive of every commonwealth in which they will stop, the first of the 22 cars that will carry the party of tourists who, under the auspices of the Indianapolis Automobile Manufacturers' Association, will "boost" Indiana all the way to the Pacific Coast, will head west and roll away from Indianapolis on Tuesday morning, July 1st; following it there will be at least 21 cars, and there may be more, but before they all get away there is to be a parade and a formal review by the Governor.

With the practical completion of the last detail of the tour, enthusiasm for it is high; it is so high, in fact, that it has been found necessary to provide a special Pullman car to carry those who would see the wonders of the West but who can find no place in the cars of the tourists. The car will be hitched to fast railroad trains along the route and will meet the tourists at all the cities where night stops have been arranged. It will leave Indianapolis on July 4th, three days after the start of the tour, and will pick up the tourists the next day at Kansas City; thence it will keep in close touch with the motorists.

During the 26 days the tourists will be on the road—no travelling will be done on Sundays—they will cover some 3,548.1 miles, the average daily mileage figuring out at 126.8. From Indianapolis, the trail leads almost directly west over some of the finest roads in eight States, with stops in the following cities, where the tourists will sleep and get into action their "boosting" propaganda: Terre Haute, St. Louis, Kansas City, Fort Riley, Colorado Springs, Denver, Grand Canyon, Salt Lake City, Reno, Tonopah, Goldfield, Carson City, Sacramento, San Luis, Santa Barbara, San Francisco and Los Angeles, which is the official end of the tour and which will be reached August 2; the return date has been set for Aug. 6th.

The complete entry list to date is as follows, seven cars being added during the past three weeks: American Motors Co., American; D. S. Menasco, American; Henderson Motor Car Co., Henderson; R. P. Henderson, Henderson; Stutz Motor Car Co., Stutz; Harry Stutz, Stutz; Marion Motor Car Co., Marion; J. I. Handley, Marion; Premier Motor Mfg. Co., Premier; H. O. Smith, Premier; Haynes Motor Car Co., Haynes; Motor Car Mfg. Co., Pathfinder; McFarlan Motor Car Co., McFarlan; Carl G. Fisher, Marmon; Apperson Bros. Automobile Co., two Appersons; Geo. H. Strout, Haynes; Empire Automobile Co., Empire; Pilot Motor Car Co., Pilot; G & J Tire Co., Premier commercial.

Giving plain indication of the fact that the run is a "boosting" run pure and simple and that it is not a contest of any kind, all of the cars will be similarly marked to that effect. Their numbers will be placed on their radiators; on their hoods "Indiana to Pacific" will be painted; on the front doors, the name of the car and "Made in Indiana" will be lettered; and on the back of the tonneau "Made in Indiana" and the name of the car will appear. Carrying out the same idea in the uniformity of marking, all of the passengers will be similarly "uniformed" in khaki suits; hats, however, will be different, and it is likely that each party of "boosters" will select some distinctive design of its own, as was the case in last year's Four-States tour.

Though most of the cars will carry extra equipment in the way of a spare can of oil and a camping outfit, it is unlikely that the camping paraphernalia ever will be used, for the daily runs have been arranged so as to bring the tourists each night to cities where there are hotel accommodations. With two exceptions, all of the cars will make the run on gasolene, the exceptions being the two Henderson cars dirven by R. P. Henderson and Ray Harroun; both will be equipped with Harroun's new kerosene carburetter and will use nothing but the heavier grade fuel on the run.

Plans Chicago-Boston-Chicago Tour.

Unless something goes amiss, the Chicago Automobile Club, on July 17th, will start an unusually long tour for its members and for any one else who may care to "join in"; it will take the motorists from the Windy City to Boston, Mass., and return, the total mileage being, approximately, 2,500. Chairman Frank X. Mudd, of the runs and tours committee of the C. A. C., has the project in hand, and the route selected is the same as one over which he travelled last year, and approximately the same as that selected for the C. A. C. reliability tour to Boston, which is scheduled for the fall. According to the plans, the itinerary of the tour is as follows: Chicago, South Bend, Ypsilanti, Detroit, Buffalo, Auburn, Utica, Albany, Worcester, Boston, New London, New Haven, New York City, Philadelphia, Hagerstown, Pittsburgh, Chicago. Two days are to be spent in New York City, and possibly three, to permit a side trip to Atlantic City. The tourists will reach Chicago on the return trip on August 4th.

FAST TIME BY HEISEY IN HILL CLIMB IN CINCINNATI

Beaten Only with Much Larger Car, He Accounts for Three Events—Touring Car Race Goes to Baesthlen.

Harold Heisey, at the wheel of a Buick, was easily the bright particular star of the Cincinnati Automobile Dealers' Association hill climb, which was held on Saturday, 21st inst., on the Stanley avenue hill in the east end of the Ohio city. Heisey accounted for both the 230- and the 300-inch events and, in addition, beat John Rainey, who piloted an Ohio to victory in two other events, in a special match race which really was the feature of the day. Heisey's best time, made with a car that belongs in the 161-230-inch class, was beaten only by J. D. Gagnon in a 600-inch Fiat and Rainey in Bob Burman's big Ohio, who in the free-for-all made the ascent in 27 and 27⅗ seconds, respectively. What, however, may be termed the "most practical" event—for cars in touring trim carrying four passengers—went to A. Baesthlen (Marmon) in 43⅕ seconds. The slant on which the climb was held is 2,340 feet in length and has an average grade of 8.5 per ment. The weather throughout the day was perfect and a great crowd lined both sides of the course; there were no accidents of any kind to mar the occasion. The summary:

Class C, under 161 cubic inches—Walkover for H. E. McCord (Empire); time, 55 seconds. Only starter.

Class C, 161-230 cubic inches—Won by H. Heisey (Buick); time, 0:33⅕. Second, J. Rothbert (R. C. H.); time, 0:39.

Class C, 231-300 cubic inches—Won by John Rainey (Ohio); time, first trial, 0:30⅖; second trial, 0:31⅕.

Class C, 301-450 cubic inches—Won by H. Heisey (Buick); time, 0:29⅘. Second, Wm. Fritsch (Cino); time, 0:32. Third, V. S. Starkey (Speedwell); time, 0:55.

Class C, 450-600 cubic inches—Won by J. D. Gagnon (Fiat); time, first trial, 0:29; second trial, 0:28.

Free-for-all in touring trim, carrying four passengers—Won by Albert Baesthlen (Marmon); time, 0:43⅘. Second, C. B. Kruse (Marmon); time, 0:48⅗.

Class D, free-for-all—Tie between John Rainey (Ohio) and J. D. Gagnon (Fiat); time, 0:27⅘. Third, S. Peyton (Cino); time, 0:30⅕. In run-off Gagnon won in 0:27. Rainey's time, 0:27⅗.

Class E, match race—Won by H. Heisey (Buick); time, 0:29⅕. Second, John Rainey (Ohio); time, 0:29⅗.

1,040,349. Ignition System. Charles F. Kettering, Dayton, Ohio, assignor to the Dayton Engineering Laboratories Co., a corporation of Ohio. Filed June 3, 1910. Serial No. 564,737. (Timer and distributer with means for grounding secondary current.) 10 claims.

1,040,414. Carburetter. George P. Rettig, Richmond, Ind. Filed Sept. 7, 1910. Serial No. 580,921. (Carburetter with multiple mixing chambers.) 1 claim.

1,040,430. Regulating Device for Hydraulic Transmission. Eugene Schneider, Le Creuzot, France. Filed Nov. 29, 1911. Serial No. 663,034. (Double cam and lever control for hydraulic transmission.) 5 claims.

1,040,431. Cushion Tire. Paul Schneider, Webster Groves, Mo. Filed Feb. 12, 1912. Serial No. 677,183. (Endless helical spring tire with internal flat band to support the coils.) 2 claims.

1,040,432. Resilient Tire. Charles T. Schoen, Media, Pa. Filed June 29, 1911. Serial No. 636,083. (Rubber tire with radial pockets containing coiled springs.) 4 claims.

1,040,443. Means for Transmitting Power. Alfred J. Signor, Elkhart, Ind. Filed Feb. 10, 1912. Serial No. 676,910. (Double bevel gear rear axle drive.) 2 claims.

1,040,471. Vehicle Wheel Tire. Charles Van Smith, Kansas City, Mo. Filed Sept. 3, 1910. Serial No. 580,445. (Tire of sections of coiled springs, and connecting means.) 1 claim.

1,040,472. Gas Engine. Charles T. Wade, Annapolis, Md. Filed Sept. 1, 1910. Serial No. 580,073. (Motor with two-diameter piston and gas-passage through piston rod.) 3 claims.

1,040,479. Controlling Mechanism. Alexander Winton, Cleveland, Ohio. Filed Dec. 5, 1904. Serial No. 235,487. (Spark and throttle control with spiral cam mechanism.) 1 claim.

1,040,496. System of Electrical Distribution. Wm. L. Bliss, New York, N. Y., assignor, by mesne assignments, to the United States Light & Heating Co., New York, N. Y., a corporation of Maine. Filed Aug. 4, 1904. Serial No. 219,461. (Current control for electric lighting and starting system.) 23 claims.

1,040,508. Internal-Combustion Engine. William C. Carter, St. Louis, Mo., assignor of one-half to Charles Otto Baxter, St. Louis, Mo. Filed March 20, 1911. Serial No. 615,505. (Valve cage with expansible packing.) 6 claims.

1,040,511.1 Automobile Wheel. Henry B. Coats, Veedersburg, Ind. Filed Aug. 29, 1911. Serial No. 646,692. (Wheel with a plurality of small pneumatic-tired wheels between hub and rim.) 2 claims.

1,040,515. Brake for Vehicles. Wm. C. Cooper, Springfield, Ill. Filed July 17, 1911. Serial No. 638,953. (Means for actuating internal and external brakes simultaneously.) 2 claims.

1,040,518. Ignition Apparatus for Internal-Combustion Engines. Mark B. Crist, Pittsburgh, and Merritt R. Wells, Wilkinsburg, Pa., assignors, by mesne assignments, to the Colonial Trust Co., trustee, Pittsburgh, Pa., a corporation of Pennsylvania. Filed Feb. 15, 1906. Serial No. 301,224. (Timer with mercury circuit breaker.) 2 claims.

1,040,528. Carburetter. Herman Dock, Westerly, R. I., assignor, by mesne assignments, to Alfred A. Whitman, New York, N. Y. Filed Nov. 24, 1908, Serial No. 464,246. Renewed June 8, 19111. Serial No. 632,021. (Carburetter with spray-nozzle opening regulated by air-valve opening.) 11 claims.

1,040,581. Tire for Automobiles, Vehicles, or the Like. Addison W. Rowe, Philadelphia, Pa. Filed Feb. 8, 1911. Serial No. 607,289. (Double-chambered cushion tire.) 3 claims.

1,040,586. Automatic Electric Speed-Regulator. Metellus D. Selden and Richmond L. Graves, Memphis, Tenn. Filed Feb. 28, 1911. Serial No. 611,,422. (Speed indicator with visible and audible signals, electrically operated.) 1 claim.

1,040,598. Safety Starting-Crank for Explosive-Engines. Joseph T. Weinzierl and Julius Sturtevant, New Kensington, Pa. Filed Dec. 19, 1910. Serial No. 598,058. (Anti-kick crank.) 3 claims.

1,040,599. Resilient Hub for Wheels. Charles A. White and Frank McLaughlin, London, Ontario, Canada. Filed March 9, 1912. Serial No. 682,694. (Spring-cushioned hub and driving means.) 2 claims.

1,040,604. Power-Transmission Gearing. Vincent G. Apple, Dayton, Ohio. Filed June 15, 1911. Serial No. 633,234. (Automatic gear-engaging means for lighting dynamos and starting motors.) 5 claims.

1,040,612. Valve for Internal-Combustion Engines. Ernest Windsor Bowen, London, England. Filed Nov. 25, 1911. Serial No. 662,371. (Sleeve valve in cylinder head.) 2 claims.

1,040,619. Carburetter. William C. Carter, St. Louis, Mo. Filed Nov. 8, 1909. Serial No. 526,823. (Multiple jet carburetter.) 8 claims.

1,040,649. Transmission-Gearing. John Demmler, Grove City, Pa. Filed May 15, 1912. Serial No. 697,382. (Combination of sliding gears and clutch.) 3 claims.

1,040,650. Traction-Engine. Richard C. De Witt, Sutter, Cal. Filed Nov. 15, 1911. Serial No. 660,391. (Transmission mechanism for traction engines.) 1 claim.

1,040,666. Fuel-Pump for Combustion-Engines of the Injection Type. Jacob Gunther, Bergisch Gladbach, near Cologne, Germany. Filed Jan. 21, 1911. Serial No. 603,845. (Cam-operated fuel pump.) 8 claims.

1,040,694. Spring Wheel. Joseph Kohler, Chicago, Ill., assignor of one-half to Kittie Collins, Chicago, Ill. Filed Aug. 28, 1911. Serial No. 646,500. (Resilient wheel with radial helical springs.) 2 claims.

1,040,697. Automobile. Alvaro S. Krotz, Chicago, Ill., assignor to Sears, Roebuck & Co., Chicago, Ill., a corporation of New York. Filed Dec. 16, 1908. Serial No. 467,866. (Stop to limit elliptic spring movement.) 2 claims.

1,040,709. Cooling Means for Gasolene Engines. Thomas J. Loftus, Castella, Cal., assignor of one-half to Harmon Bell, Oakland, Cal. Filed May 9,9 1911. Serial No. 625,984. (Device for injecting water with gas charge.) 2 claims.

1,040,712. Valve for Gas-Lighting Systems for Automobiles. Albert Lutenegger, Sacramento, Cal. Filed Dec. 28, 1910. Serial No. 599,682. (Gas-tight needle valve.) 3 claims.

1,040,716. Rotary Motor. Henry Manrodt, Brooklyn, N. Y. Filed April 1, 1911. Serial No. 618,286. (Revolving cylinder motor.) 11 claims.

1,040,755. Spring Wheel. Peter G. Rapp and Peter H. King, Chicago, Ill. Filed May 15, 1911. Serial No. 627,258. (Resilient wheel with semi-elliptic springs between inner and outer rims.) 7 claims.

1,040,766. Compound Valve and Starter. Charles C. Roth, Indianapolis, Ind. Filed May 22, 1911. Serial No. 628,839. (Air valve for air-starting motors.) 4 claims.

1,040,853. Mixer for Gaseous Fuel. Wilbur W. Bergold, Canton, Ohio, assignor of one-half to J. M. Bergold, Canton, Ohio. Filed Jan. 5, 1912. Serial No. 669,530. (Auxiliary mixer for carburetters.) 5 claims.

1,040,865. Non-Skidding Tire. John G. Boss, Denver, Col. Filed Sept. 1, 1910. Serial No. 580,097. (Ribbed tire tread.) 1 claim.

1,040,884. Automatic Spark Advancer. Clyde C. Charles, Moisington, Kan. Filed Feb. 27, 1912. Serial No. 680,295. (Automatic ignition timing governor.) 6 claims.

1,040,917. Rebound Check. Walter Arthur Finley, Fairmont, W. Va., assignor of one-fourth to Frederic Heimick, Fairmont, W. Va. Filed Dec. 14, 1911. Serial No. 665,600. (Rebound check with adjustable friction drum and band.) 18 claims.

1,040,920. Tire. Henry G. Fiske, New York, N. Y., assignor, by mesne assignments, to the Columbia Motor Car Co., Hartford, Conn., a corporation of Connecticut. Filed July 1, 1899. Serial No. 722,526. (Thick-tread cushion tire with internal cushion to support tread when tire is deflated.) 8 claims.

1,040,925. Wheel. Franklin A. Frommann, Detroit, Mich. Filed Sept. 30, 1911. Serial No. 652,144. (Resilient wheel with independently movable, spring-supported segmental sections.) 9 claims.

1,040,945. Spring Wheel. John W. Heagney, Melrose, Iowa. Filed Nov. 25, 1911. Serial No. 662,381. (Spring tire with tread of linked metal members.) 2 claims.

1,040,980. Automobile-Pump. Edwin H. Haney, Stockton, Cal., assignor of one-fourth to Andrew McCormick and Harry Jacoby, Stockton, Cal. Filed Jan. 13, 1912. Serial No. 671,017. (Oscillating-cylinder air pump). 2 claims.

1,040,9996. Gas Engine Priming Cup. Charles W. Beck, Rockville Center, N. Y. Filed Jan. 9, 1911. Serial No. 601,501. Renewed March 7, 1912. Serial No. 682,090. (Priming cup with closures for both filling and cylinder ports.) 9 claims.

1,041,093. Means for Adjusting Clutch Inserts. Frank Jungjohann, Davenport, Iowa. Filed Jan. 31, 1912. Serial No. 674,596. (Set-screws for pushing clutch inserts outward when worn.) 13 claims.

1,041,097. Combined Vehicle Hub and Shock Absorber. Charles L. Kennedy, Winnipeg, Canada. Filed March 27, 1912. Serial No. 686,600. (Enlarged hub containing spring shock absorbers.) 2 claims.

1,041,0999. Carburetter. James Kerns, Wayne, Mich., assignor, by direct and mesne assignments, of three-fourths to John Howse and one-fourth to Nettie Talmon, Wayne, Mich. Filed Jan. 9, 1911. Sereial No. 601,626. (Carburetter with drum-shaped mixing chamber and revolubly adjustable gasolene passage carrying spray nozzle.) 1 claim.

1,041,132. Power Transmission Mechanism. Charles David McClintock, Oakland, Cal., assignor of fifty-eight one-hundredths to Saul Cornfield, Oakland, Cal. Filed Jan. 15, 1912. Serial No. 671,205. (Piston-actuated clutch and controlling means.) 10 claims.

1,041,139. Anti-Skid Device for Block Tires. Stephen S. Miller, Akron, Ohio, assignor to Consolidated Rubber Tire Co., New York, N. Y., a corporation of New Jersey. Filed Sept. 15, 1910. Serial No. 582,235. (Cross chains and adjustments for block tires.) 2 claims.

1,041,154. Two-Cycle Explosion-Motor. Leon Palous, Berlin, Germany. Filed Dec. 26, 1911. Serial No. 667,799. (Fuel and air valve arrangement for two-cycle motor.) 3 claims.

1,041,162. Internal-Combustion Engine. Balfour Read, Bedford, England. Filed Aug. 10, 1910. Serial No. 576,435. (Motor with pumping chamber in tendem with explosion chamber and the pistons connected by hollow sleeves containing ports.) 8 claims.

1,041,182. Cushion-Tired Wheel. William D. Simpson, Columbia, S. C. Filed May 4, 1912. Serial No. 695,061. (Wheel with pneumatic cushions between inner and outer rims.) 4 claims.

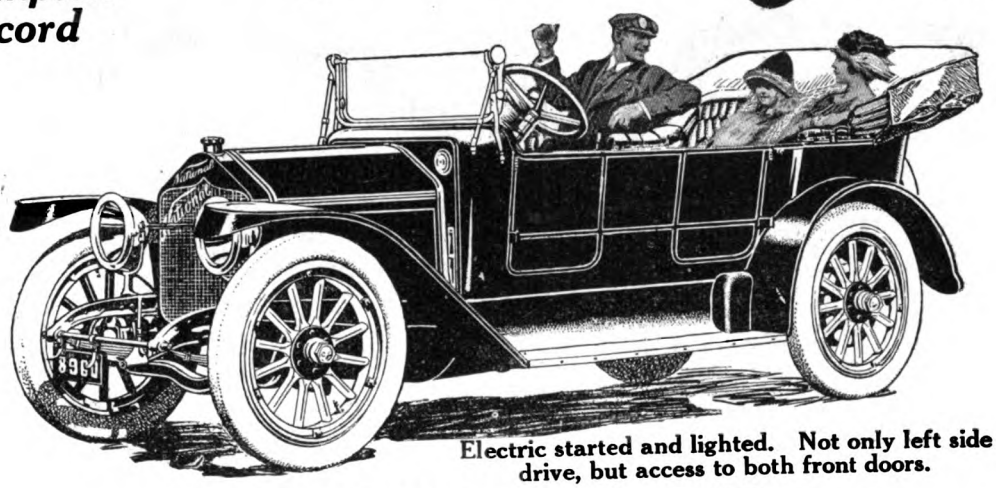
1,041,191. Traction Engine for Cultivators. Herbert P. Suhl, Fortuna, Mo. Filed Oct. 4, 1911. Serial No. 652,724. (Self-contained detachable two-wheeled farm tractor.) 4 claims.

1,041,244. Resilient Wheel. Charles J. Craig, Lathrop, Mo. Filed Jan. 7, 1911. Serial No. 601,337. (Wheel with C-springs between hub and rim, and with cross-rods across rim to prevent lateral movement.) 1 claim.

1,041,303. Internal-Combustion Engine. Hams Knudsen, London, England. Filed Feb. 27, 1911. Serial No. 611,447. (Concentric valves in cylainder head with overhead gear.) 6 claims.

1,041,319. Lumber-Truck. John A. McGarry, Chicago, Ill. Filed Jan. 11, 1911. Serial No. 601,955. (Roller mechanism for shifting load on truck platform.) 1 claim.

1,041,336. Pneumatic-Pressure Gauge. Ole Olsen, Oakland, Cal. Filed June 1, 1911. Serial No. 630,608. (Automatic tire gauge with air trapping valve.) 2 claims.



1,041,660. Tire Tool. Axel A. Nelson, Washington, D. C. Filed June 28, 1911. Serial No. 636,338. (Lever tool for removing tire casings.) 1 claim.

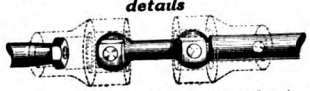
Holds World's Stock Champion Record

National

Holds world's record for fastest 500 miles in competition

Electric started and lighted. Not only left side drive, but access to both front doors.

Five Models, $2750 to $3400



The National is a good dealer's proposition

It does mean something to you to be the dealer for the *National*—an asset, a reputation builder and a certainty of profitable business—and now is your chance to get it.

Identify yourself *now* with the car of *now* and the *future*—for the *National*, "*the $5,000 car with the $3,000 price*," is destined to continue to be the most popular high-grade car.

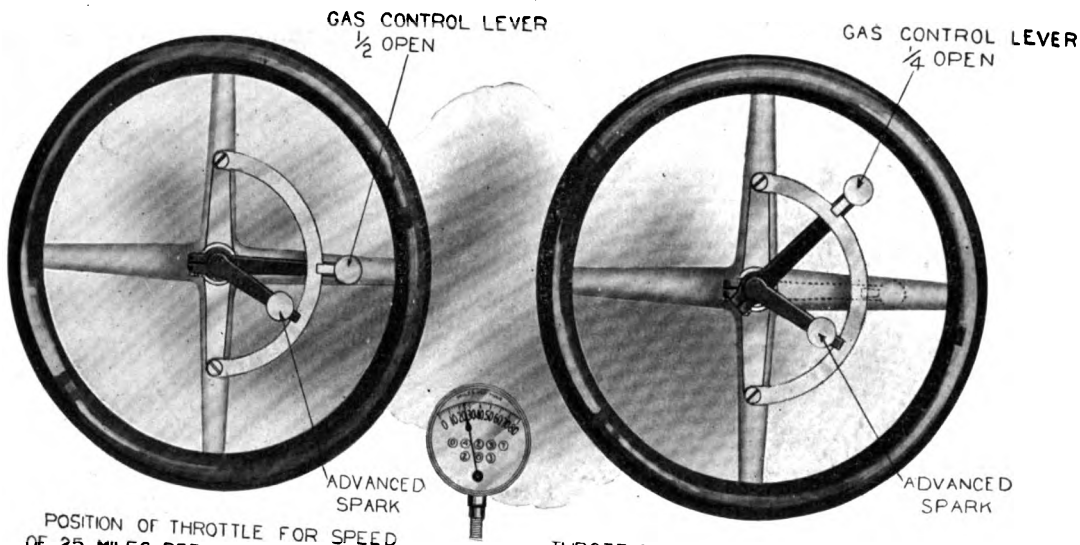
When you consider the selling advantage of the many superior points about the *National*, the profit that remains profit, the good will the *National* brings you with the certainty of an increasingly profitable business—you will see the opportunity that is now offered you.

One of many perfected little details

Double Universal Joint for driving magneto, taking all strain from bearings. Large wearing surfaces assure minimum wear and lost motion. Magneto is easily removed. This is but one of the many details of superior *National* construction which mean much to *National* owners and dealers.

Visit our factory

Come in to the factory and see for yourself the many advantages the *National* offers you. It will be well worth your time, even if you do not take the agency now. If you cannot come now write today for *National* Catalog and our dealer's proposition.



- Long stroke (4 7-8 x 6), flexible and noiseless motor with enclosed valves.
- Left side drive, center control.
- Gray & Davis electric starter.
- Gray & Davis dynamo electric lighting system.
- Bosch double dual magneto.
- Multiple jet carburetor.
- 12-inch Turkish upholstery.
- Full heavy nickel trimmings.
- Adequate baggage carrying compartment concealed in body, but easily accessible.
- Powerful and reliable brakes.
- Spacious interior. Tire pump integral part of the motor.
- 128-inch wheel base.
- Adjustable ventilating and rain vision windshield.
- Hoffecker steady hand speedometer. Electric horn.
- Tire carrier in rear.
- Silk Mohair top, cover, curtains.
- Full-floating rear axle.
- Resilient springs; 3-4 elliptic in rear, semi-elliptic in front.
- Large gasoline pressure feed tank with gauge in rear.
- Robe rail foot rest and foot mat in running-board.
- Plain, continuous enclosed metal guards.
- Easy riding qualities unexcelled.
- Oiling system demonstrated to be perfect.
- Truffault-Hartford shock absorbers.

Your Bearing Equipment Does Make a Difference

POSITION OF THROTTLE FOR SPEED OF 25 MILES PER HOUR ON AVERAGE CAR, USING POWER CONSUMING BEARINGS.

THROTTLE POSITION FOR SAME SPEED ON CAR EQUIPPED THROUGHOUT WITH NEW DEPARTURE BALL BEARINGS.

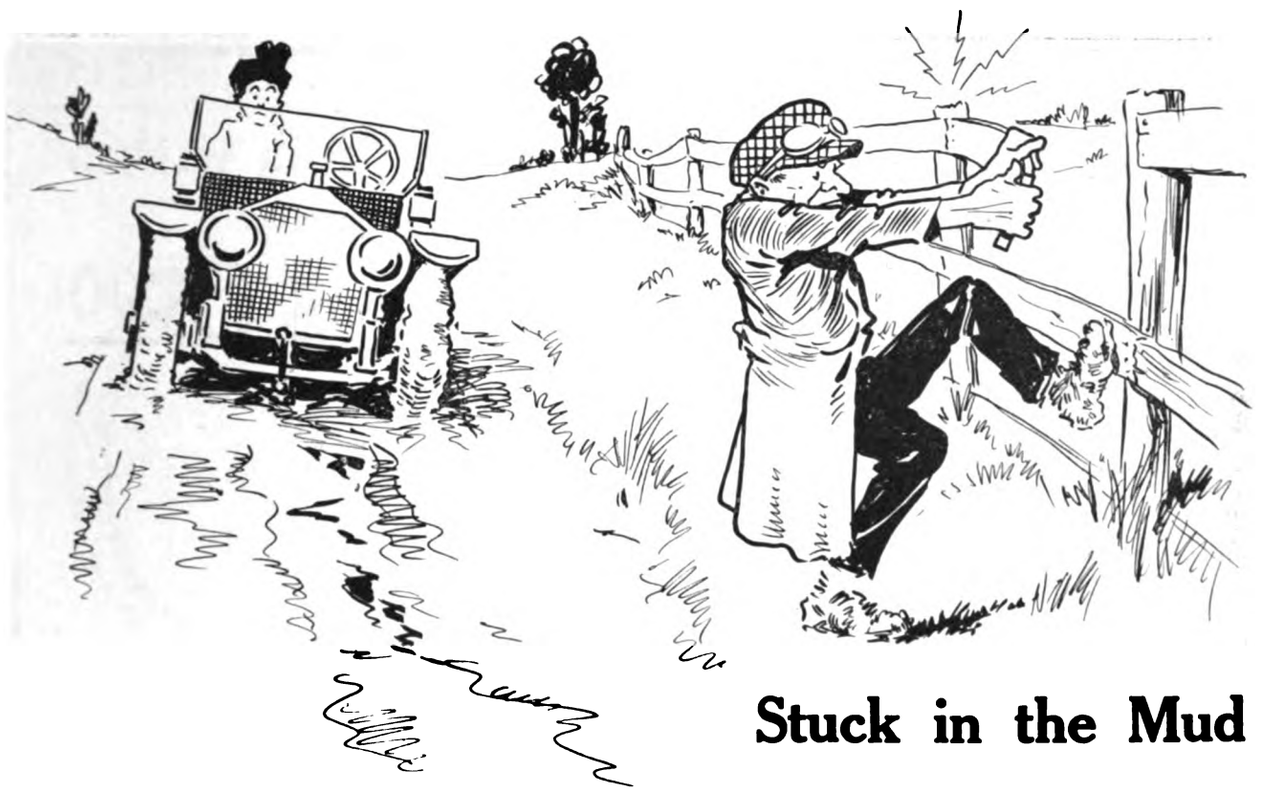
New Departure Ball Bearings

Save Gasolene Consumption by Diminishing Friction, and Minimizing Maintenance and Repair Costs.

EVERY practical motorist knows that power lost in transmission from its source to the point of application reduces the efficiency of the mechanism. More fuel is needed to do a given amount of work when the frictional losses are high, and only a comparatively small part of the motor energy is available for vehicle propulsion.

Ball Bearings overcome this very condition more completely than do bearings of any other type.

New Departure Ball Bearings are superior eliminators of friction. By conserving power at the bearing points, maximum motor energy is available, and the gasolene used to overcome the friction of bearings of other types is utilized for driving the car.



New Departure Ball Bearings are guaranteed, and have proven their quality by successful installation in the majority of American made cars.

Whether you are a manufacturer or motorist you should have our new brochure on "Bearing Friction and Its Elimination." Copy will be sent you on request.

Elyria-Dean
TRADE MARK

Now the TUTO HORN is within the reach of every car owner

Improvements and Manufacturing in Large Quantities makes it possible to furnish the Genuine $25.00 TUTO for $15.00. This new price includes all of the Exclusive features that have made the TUTO horn so practical and popular:

$15.00

Two-tone Feature—Low note for regular service—loud note for emergencies—from one horn and one button.

Instantaneous Action—No loss of time for motor to "speed up."

Steering Wheel Fixtures—Protects the cord—gives neat, permanent job.

Button Always Under Thumb—Gives quick action in case of emergency.

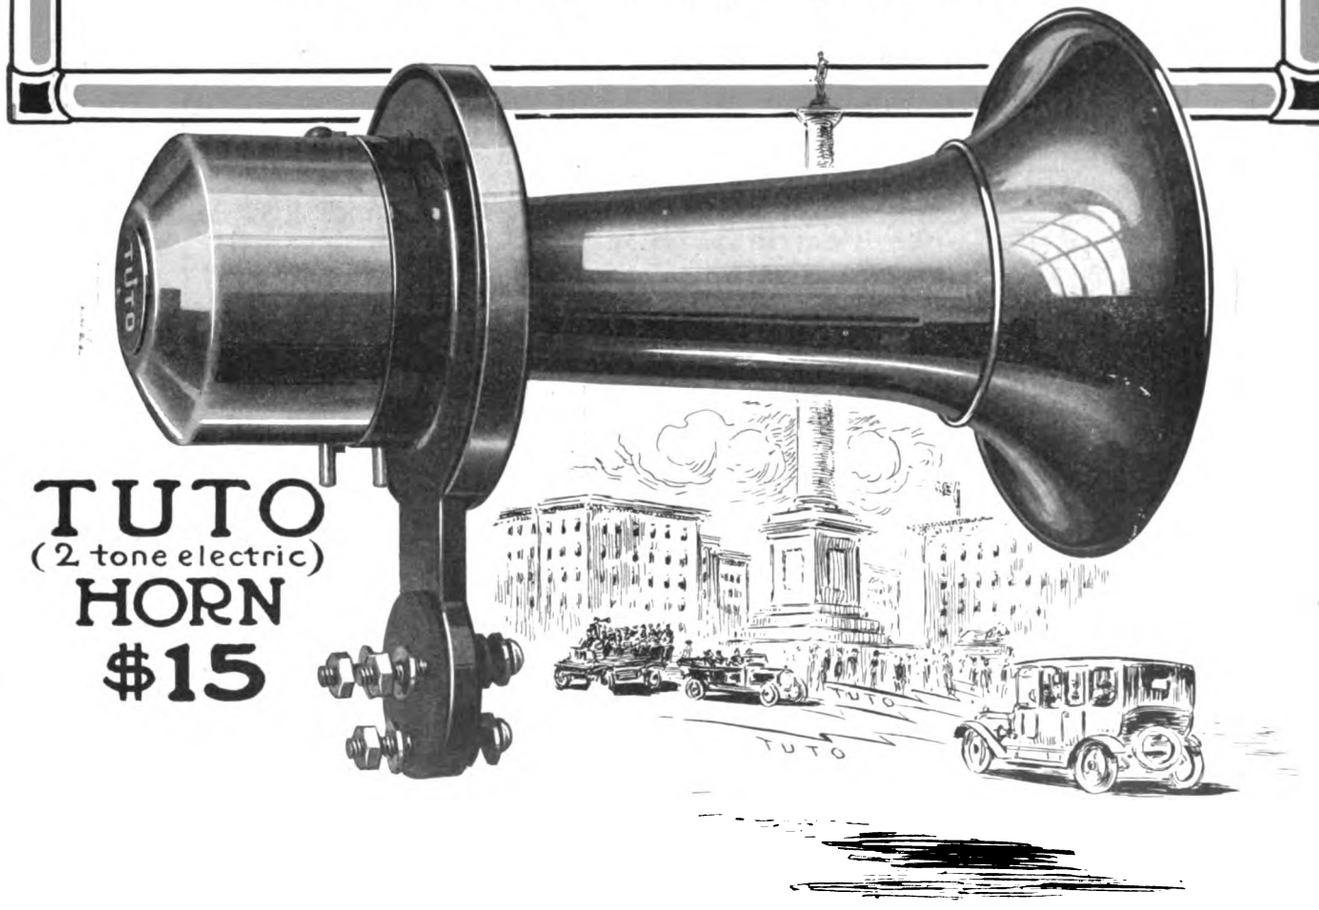
Automatic Operation—Unconscious gripping of button upon approach of danger forces button clear down and gives **loud note—instantaneously.** No hesitating, no selecting of horn buttons, etc.

Reliability—Always responsive, as same button, cord and horn are used for both notes, thus are self-testing. There is nothing to oil or clean, so neglect will not interfere with operation or ruin the working parts, the same as in mechanical or motor horns.

Liberal Guaranty—Guaranteed indefinitely against inherent defects or breakage of parts due to such defects. We always give the customer the benefit of the doubt.

No Experiment—The Tuto Horn has been marketed for three years and has given unusual satisfaction through its reliability and freedom from trouble. This is proven positively by our records, which **show** that we have been called upon by less than 1% of Tuto owners for advice or repair parts.

Once a Tuto User, always a Tuto Advocate



Tuto users never can go back to the old bulb horn or to the Slow Accelerating Motor Horn.

TRADE MARK

A High Grade Electric Warning Signal Guaranteed, $8.00

THE REXO HORN IS THE STANDARD EQUIPMENT HORN, evidenced by the number of manufacturers who furnish the REXO on cars they make.

Made from the best of selected materials, assembled by expert workmen in a well-appointed factory.

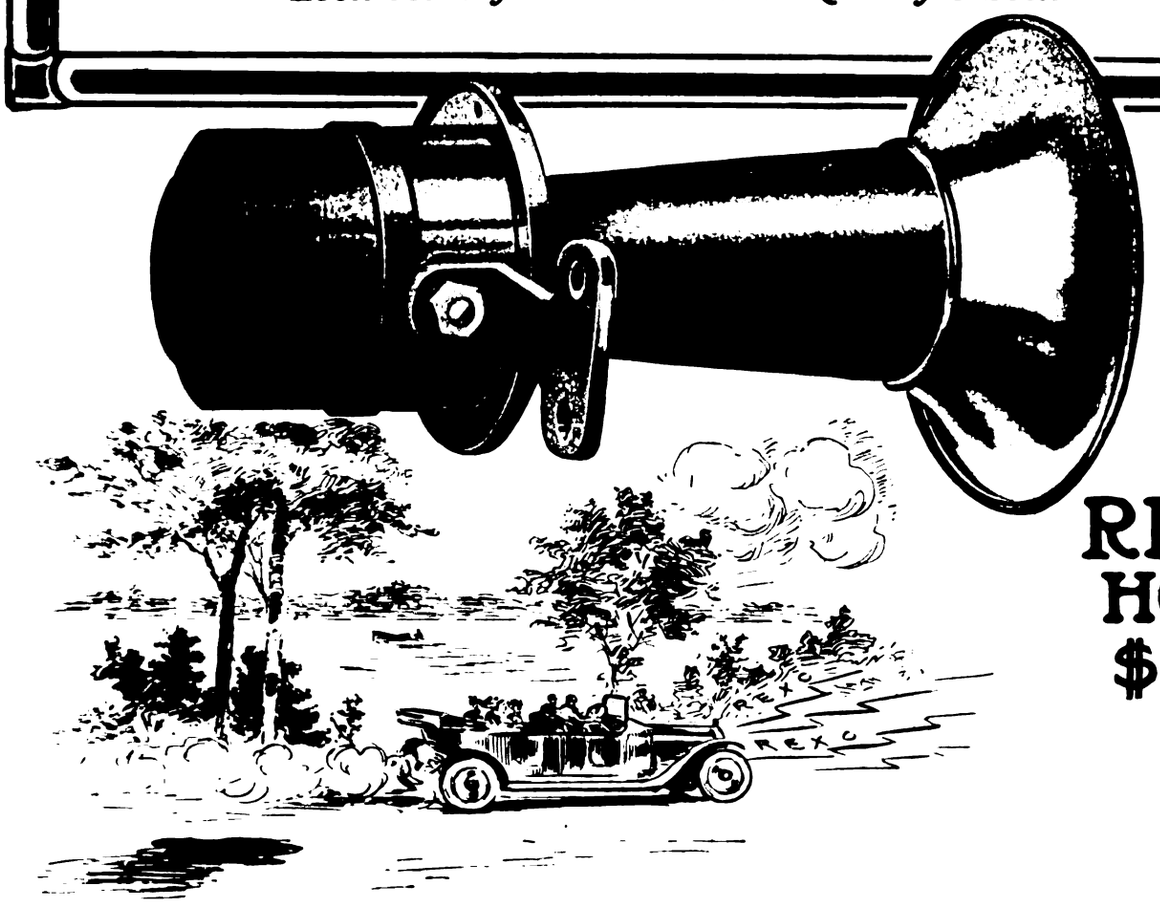
The action is instantaneous, always responsive.

There is nothing to oil or grease, nor is it necessary to clean in gasoline, as there is nothing to clog or congeal.

Guaranteed indefinitely against inherent defects or breakage of parts due to such defects.

We always give the customer the benefit of the doubt.

Your Dealer will demonstrate the REXO for you today.



DEALERS: Ask for our dealers' proposition—it is a winner!

Of Thoroughbred Stock

You know what that expression means when applied to a horse—especially if used by one who knows horses.

What a thoroughbred is among horseflesh, the Chalmers "Six" is among motor cars. And we use the term exactly—as the old horseman would use it—and not in the careless speech of the grandstand.

For the Chalmers "Six" rings true to the thoroughbred definition—"pure bred and of running stock."

Staunch of frame and sinew, powerful, full of life, alert and eager, yet easily controlled—this great car has all the thoroughbred qualities.

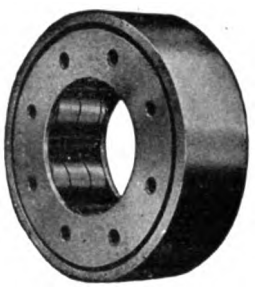
Clean-cut in appearance, trim, graceful, well-groomed, the "Six" gives the same eye-delight as a handsome, proud, blooded race-horse.

And the "Six" is a pedigreed car, too. Its predecessors—Chalmers "30" and Chalmers "Thirty-six"—were winners before it—victors on track and road; record breakers in sales, too.

The "Six" is built in Chalmers shops under the direction of men who take as much pride in a fine motor car as horsemen ever took in fine racing stock.

And this great car, with such "stuff" in it (as the horsemen say), with such lineage behind it, such quality and breeding in every line of it, we sell you at a medium price—$2600 for the 7-passenger Touring Car.

More satisfaction, service, pride of possession, you cannot buy. Better performance you cannot find in any car men have yet built. Everything in the way of convenience and luxury this "Six" supplies you.



May we offer you proof in the car itself? Please phone or call at our dealer's salesroom.

HYATT QUIET BEARINGS

Line Contact *vs.* Point Contact

THE fundamental advantage of the roller bearing over the ball bearing lies in the fact that it has a line of contact as against the point of contact of the ball bearing.

The great increase of contact thus affected lengthens the life of the bearing by reducing the duty on the operating surfaces.

This basic principle is carried even farther in the Hyatt Roller Bearing by the use of a flexible roller that relieves the shafts and gears of excessive strain.

Vibrations that are ordinarily transmitted by other types of bearings are cushioned and absorbed by the Hyatt. It is this feature of the Flexible Roller that reduces noise.

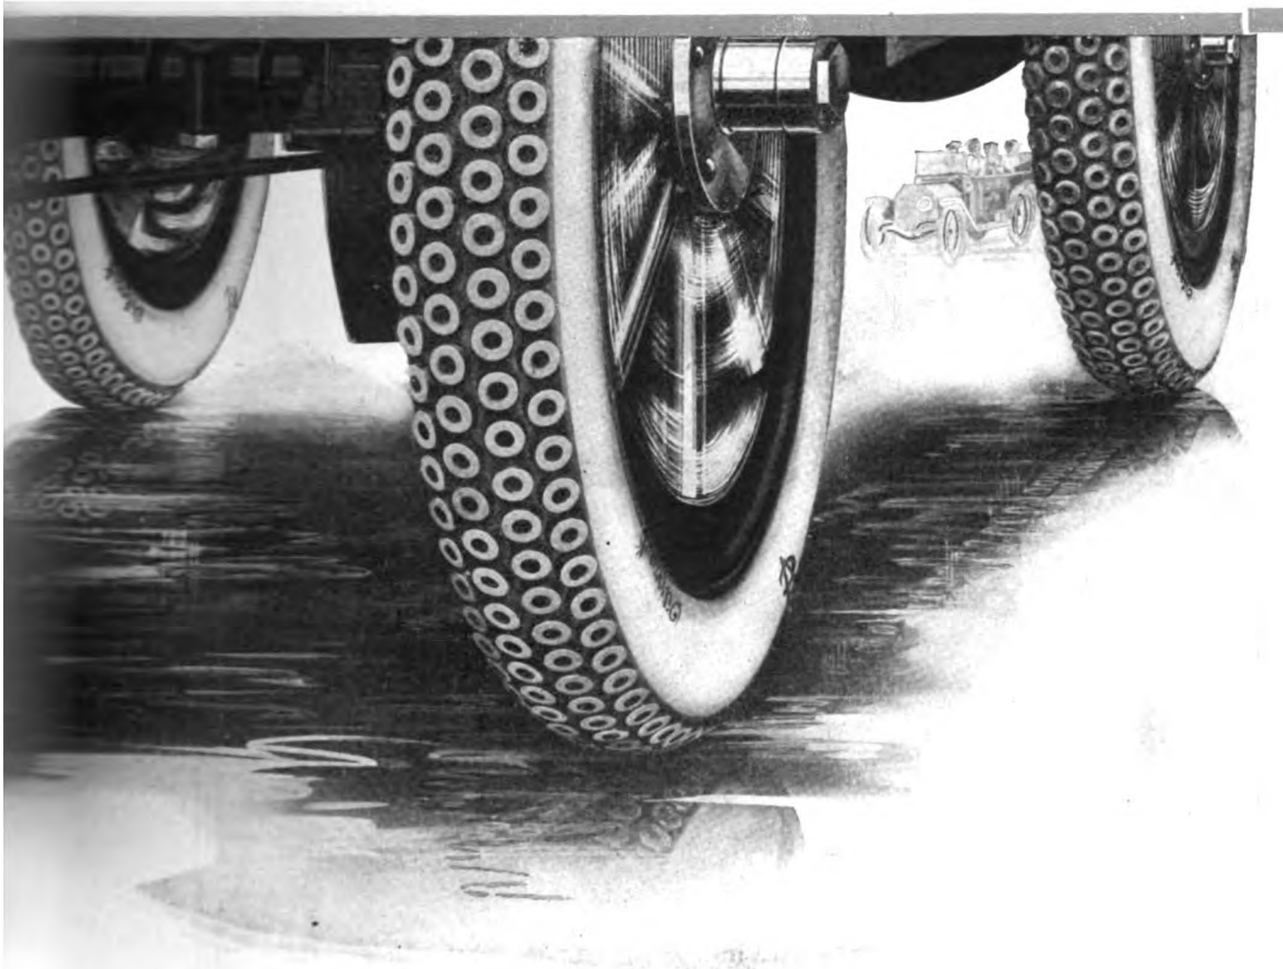
Now in Their Fourth Big Season of Doubling and Redoubling Sales



THE mirror-like slippery pavement affords as sure a footing for the car shod with Vacuum Cup Tires as the fine, dry macadam road. Whether the surface is wet or greasy, these tires are *guaranteed* not to skid, or are returnable at full purchase price after reasonable trial.

The thick-walled cups drive deep and give positive traction in mud. Discontent with tire *service* also ends abruptly with the adoption of

PENNSYLVANIA Oilproof VACUUM CUP TIRES

Digitized by Google

THEY are the heaviest tires of the rated sizes manufactured. Their construction is the strongest, their composition the toughest---and absolutely *oilproof*---immune from "oil disease." With each Vacuum Cup Casing goes a definite printed guarantee of

4,000 MILES

Their actual service mileage averages a far greater distance.

Important to Dealers: The handling of Vacuum Cup Tires is the smoothest, most satisfactory of all tire propositions, with particular reference to dealings with the consumer. Their unusual quality, their ready saleability, and the sound policy under which they are guaranteed and sold, put them in a class by themselves.

The car and the contract

THE 1914 American Underslung "Six" is sold merely by a logical explanation of how underslung construction insures absolute riding safety, increases power by one-fifth, cuts vibration 50 per cent and actually reduces upkeep expense.

The American dealer need not make commonplace comparisons; he can concentrate on the big and plainly apparent advantages of underslung construction. He can make the length of the wheel base, the size of the motor and the completeness of the equipment of secondary importance.

And in the second place American Underslung snap and style creates endless inquiries. The entire community discusses it.

You cannot help making money with such a car and contract as we give you. Wire us today for territory details. If you agree we would like to send a district sales manager to see you. ***Tie up with a car that is talked about.***

A Mercury Switch Does It!

BAILEY ELECTRIC SYSTEM

Benjamin F. Bailey, the eminent electrical engineer, has made it possible at last for the purchaser to secure a high grade starting, lighting and ignition system on a medium priced car—a system in which all troublesome devices, such as reverse current relays, magnetic switches, vibrating contacts, delicate rheostats, slipping clutches, corroding platinum points have been eliminated. A patented mercury switch does it.

There are no moving parts in its system of regulation.

The illustration shows the equipment supplied with the Krit Roadster selling at $1100.

This Krit Roadster is fitted with 3 11/16" x 4¼", 4-cylinder motor. Compression, 75 pounds.

The Bailey starter will turn this motor over at 120 R.P.M., which is twice as fast as the average starter on $5,000 cars will turn.

The outfit is high-grade in every respect, and it is much superior to that offered by most cars selling for twice as much. Our Book "Bailey Electric Systems and Electric Lighting Explained" will be of great interest to you. It gives details and prices.

Good Axles Will Boost Your 1914 Sales

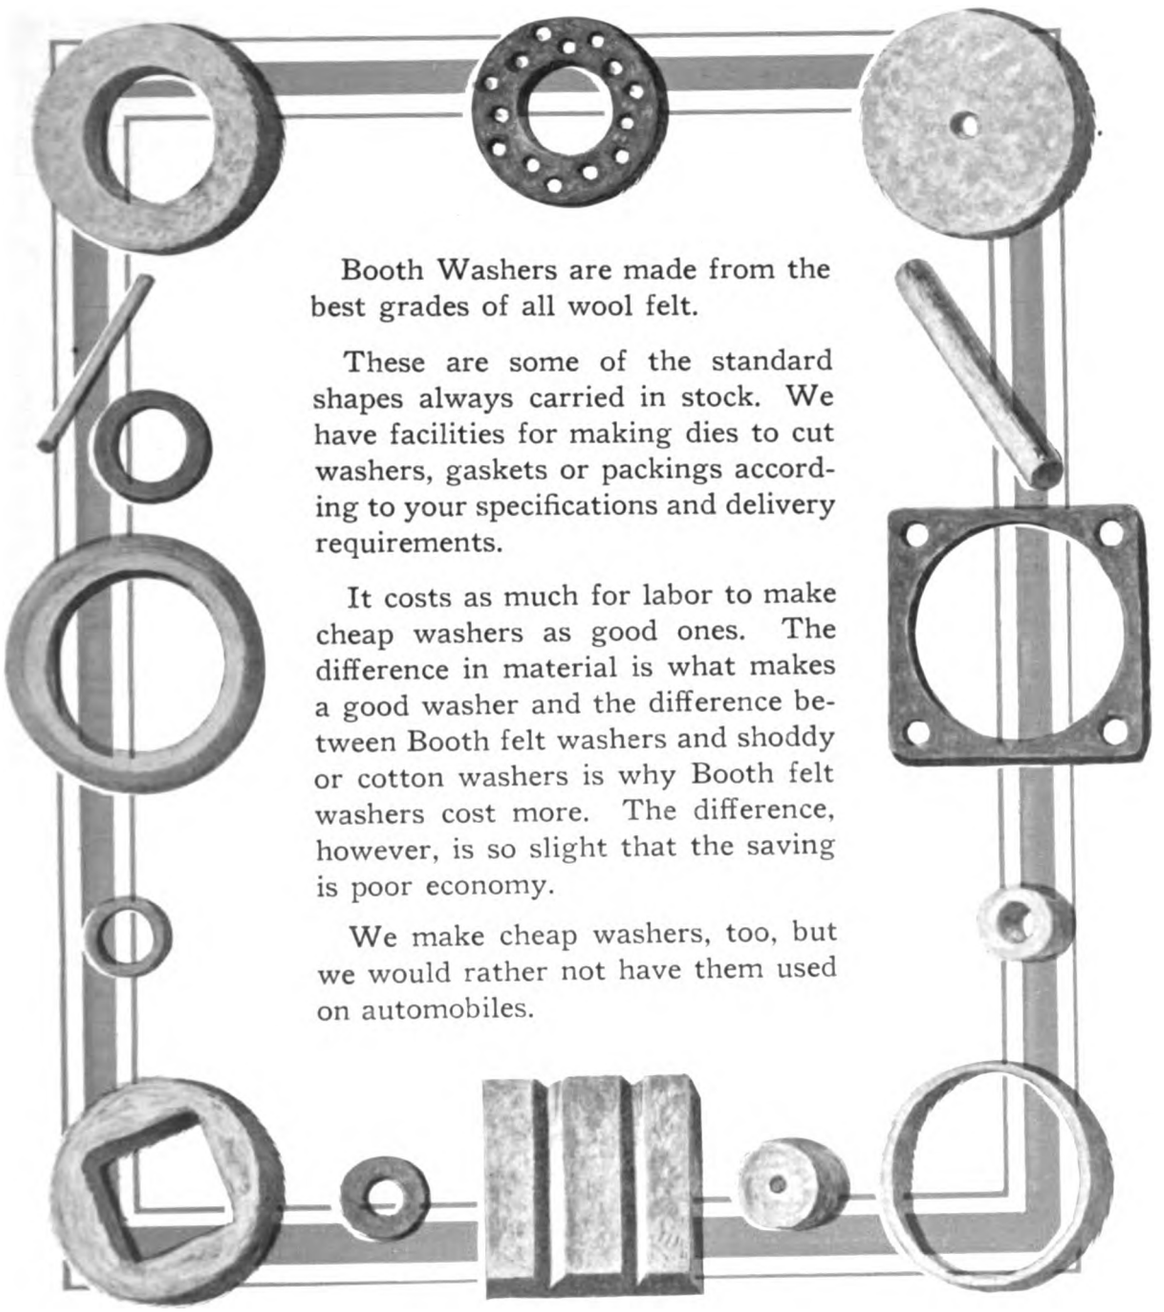
THE splendid reputation of Metal Products, applied to your 1914 cars, will increase your sales and add to the good name of your cars.

For several years a number of the best known automobiles have given axle-satisfaction by using Metal Products axles.

We have open capacity for 1914 for axles for both gas and electric pleasure cars. We make only the highest grade products, ***guaranteeing materials*** and ***workmanship*** and make deliveries as you want them.

We can give you what you want, either in standard type axles or those built to your specifications. We make unusually high grade rear axles of the pressed steel housing type.

Stock axles for immediate delivery.



Take up your proposition with us before settling your contract.

Quality

Booth Washers are made from the best grades of all wool felt.

These are some of the standard shapes always carried in stock. We have facilities for making dies to cut washers, gaskets or packings according to your specifications and delivery requirements.

It costs as much for labor to make cheap washers as good ones. The difference in material is what makes a good washer and the difference between Booth felt washers and shoddy or cotton washers is why Booth felt washers cost more. The difference, however, is so slight that the saving is poor economy.

We make cheap washers, too, but we would rather not have them used on automobiles.

What are YOU doing to GUARANTEE the tightness of your bolted-up construction?

The efficiency of a nut lock is based on the efficiency of a castellated nut and cotter key.

To attain this efficiency the NUT LOCK must be of a section designed to give proper strength, and of material so treated that its efficiency will outlast the efficiency of the bolt on which it is used.

This efficiency is demanded by steam railroads who have used the device for forty years, but—

How many automobile manufacturers can tell you whether the NUT LOCKS used in their last year's series have an efficiency beyond a common washer?

Where refinements count for so much—where security is obviously of the utmost importance both from a selling and a moral standpoint—can you afford to be indifferent or lax regarding a vital detail?

Would you like to "get down to brass tacks"?

SPARTON

THE ELECTRIC SIGNAL DE LUXE

A QUARTER million annual capacity made the "SPARTON" price.

THE SPARKS-WITHINGTON COMPANY, one of the world's largest producers of pressed metal and Automobile parts, waited nearly two years after completing the present "SPARTON" before announcing the SELLING PRICE.

WE KNEW IN ADVANCE that we were best equipped to make the BEST WARNING SIGNAL. We knew that any WARNING SIGNAL bearing the SPARKS-WITHINGTON guarantee would be instantly indorsed by the industry and car owners alike.

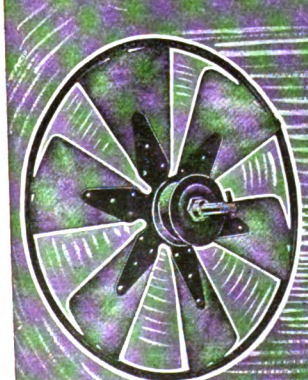
WE WERE EQUALLY POSITIVE that a high class MOTOR DRIVEN Signal selling at the buzzer horn price would secure immediate "SPARTON" distribution wherever Warning Signals are sold.

AND NOW THE "SPARTON," the Electric Signal De Luxe. Everything you could possibly expect in a superior Warning Signal and delivered under an unconditional selling and make-good guarantee.

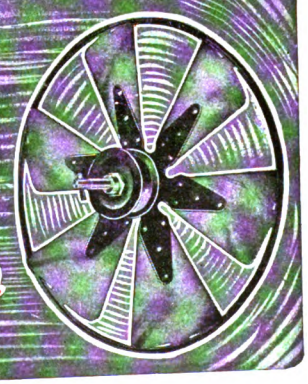
It Will Be More Profitable to Sell the "SPARTON" than to Compete Against it

FOUR MODELS FOR SMALL and large cars alike. Both dash and under-hood types finished in gunmetal or with gunmetal and brass or nickel projectors.

PRICES $10.00 to $15.00



The new "SPARTON" catalogue will be mailed on request.



INTELLIGENT MOTOR COOLING IS VITALLY NECESSARY TO SUCCESSFUL MOTOR CAR BUILDING

Sparks-Withington radiator Automobile fans are more in demand than all other makes combined. We specialize in the delivery of MORE AIR. Our product is accepted by most Car Manufacturers as STANDARD.

In our testing laboratories we have compiled important data on cooling. It is the result of many years' experience that could only be secured through solving intricate cooling problems. Let us know your requirements. We build on an average of 1000 FANS DAILY. The chances are that we can meet your specifications from stock.

Third of the Hupmobile Out-door series now appearing in the nation's advertising—and giving Hupmobile dealers a new sales lead.

A huge sales organization with one definite aim

Hupmobile

Hupmobile "32" Six Passenger $1200 f. o. b. Detroit

In Canada, $1450 f. o. b. Windsor

Four-cylinder motor, cylinders 3¼-inch bore by 5½-inch stroke, cast en bloc. Unit power plant.

Selective type transmission, sliding gears.

Irreversible, screw and double nut steering gear.

Full-floating rear axle.

Twelve by two-inch brakes, external contracting and internal expanding.

Wheelbase, 126 inches.

Tires, 33x4 inches.

Equipment of windshield, mohair top with envelope, Jiffy curtains, speedometer, quick detachable rims, rear shock absorber, two folding and revolving seats in tonneau, tonneau foot rests, gas headlights, Prest-O-Lite tank, oil lamps, tools and horn.

Finish, black with nickel trimmings.

"32" Touring Car *In Canada, $1150*	$1000
"32" Roadster *In Canada, $1150*	$1000
"20" H.P. Runabout *In Canada, $850*	$750

F. O. B. Detroit, *or Windsor*, fully equipped

Our aim is to make every Hupmobile dealer an integral part of a huge sales organization—not let him remain merely an automobile dealer.

We believe thoroughly in co-operation.

We want the co-operation of every Hupmobile dealer, naturally.

But, what is vastly more important to the dealer himself, we want him to accept and avail himself of our co-operation in his own territory.

We want the Hupmobile dealer to be as close to the factory as those members of the sales department who are inside the factory.

He should be, in fact, a member of the Hupmobile sales organization—working along definite lines, with a very definite purpose to accomplish.

And we can materially aid and assist every Hupmobile dealer who imbues himself with this spirit, as the majority of our dealers have learned.

A car with a reputation, and the quality to maintain its good name; a widespread and continuous advertising compaign; a home journal for Hupmobile dealers and no one else; sales suggestions of real and definite value—

These are the Hupmobile dealer's privileges and prerogatives — the things that link him closely and securely to the factory.

These are advantages beyond the power of every motor car manufacturer to offer.

Hupp Motor Car Company, 1254 Milwaukee Ave., Detroit, Mich.

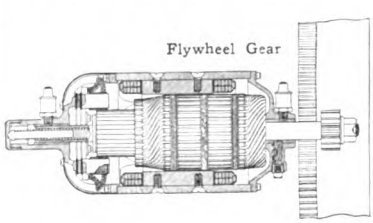
MR. DEALER---

How would you like to be able to talk to your prospects as follows?

"Here is a starter that is absolutely automatic. You have seen so-called 'press the button' starters which worked when you pressed the button—provided you did a few other things also. With this starter you just forget the other things.

"No, its automatic action is **not** due to a lot of complications! On the contrary, it eliminates practically all the mechanism that used to be thought necessary, such as intermediate shifting gears, ratchet drives, friction clutches and so on. There is absolutely nothing to this starter except a well-built electric motor having a certain amount of end-play to the armature.



"When the button is pressed, the armature automatically moves endwise till its pinion engages the flywheel gear. Then it turns the engine over, and automatically slips out of mesh at the instant of the first explosion!

"This starter operates **quietly,** too, because the gears do not stay in mesh with the flywheel for even an instant after the engine starts.

Just Press the Button

"Some starters need a friction clutch to protect them from a kickback. This starter will turn the engine over **in spite** of an advanced spark, if the operator should be careless.

"With all its power, this starter weighs only 47 pounds. It is built by a concern which never yet has produced a commonplace article to compete with commonplace products."

The RUSHMORE STARTER

will make you a satisfied customer with every sale; and your profits will be **real** profits because there are no comebacks.

If your cars are not Rushmore-equipped you will want to know the Rushmore System anyway, not only the Starter but the Dynamo, which is as much better than other dynamos as the Rushmore Starter is better than other starters.

Send your name for illustrated booklet with full description

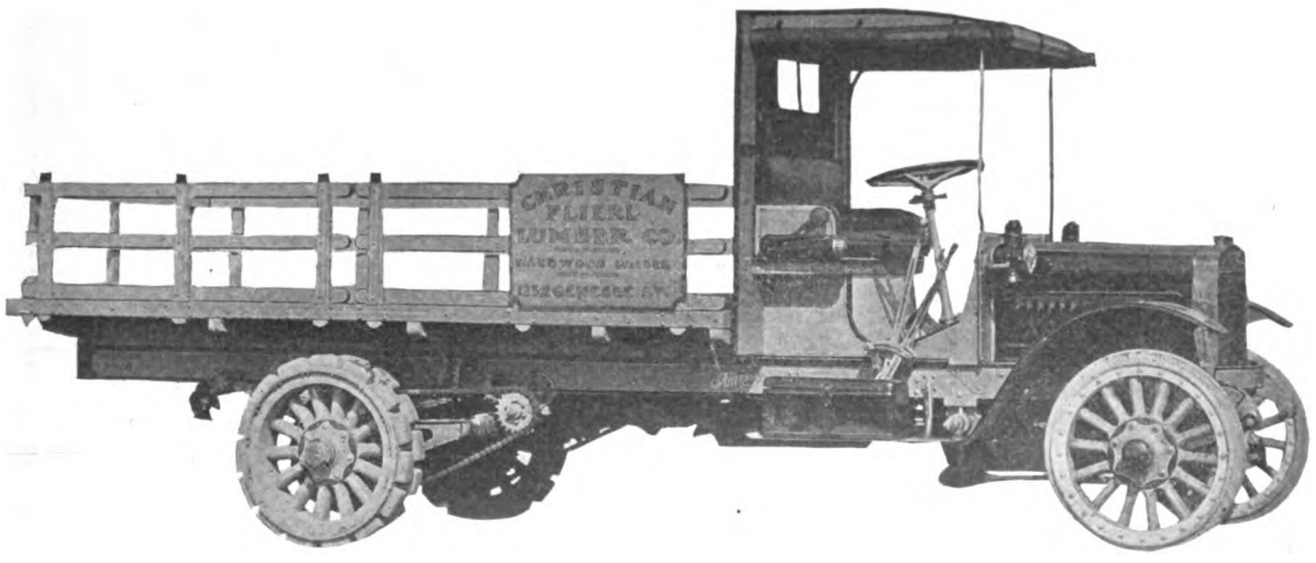
THE ATTERBURY LINE



As a matter of history it is interesting to know that among the first commercial cars produced by this company was a fleet of fifty sight-seeing busses for use at the St. Louis World's Fair, 1904.

Soundness of Atterbury design and thoroughness of Atterbury construction is shown by the fact that many of them are still giving as good service as ever at a phenomenally low upkeep cost.

The Atterbury radius rod construction is the principal factor in giving our trucks the length of life for which they are famous. This radius rod has two vertical and two horizontal motions and is provided with a heavy shock absorbing buffer spring which effectually takes up the shocks and strains incidental to rough roadways or sudden starts and stops.

Our engineers are constantly experimenting and testing to find weak points in Atterbury construction. We keep in close touch with Atterbury users to see what develops from their use of Atterbury trucks.

Wherever we find a weak point we remedy it in our design. This policy carried out for the ten years we have been in business has developed Atterbury trucks to a degree of perfection not equaled by any on the market.

BOSCH PLUGS

ARE OBTAINABLE EVERYWHERE

BOSCH Plugs are carried by most of the more prominent dealers throughout the United States and Canada. A very thorough and extensive sales system has been arranged so that if any dealer is not yet carrying Bosch Plugs he can obtain them from Bosch Distributors, Bosch Supply Stations, or Bosch Branches.

These three score or more stations are prepared to furnish Bosch Products promptly and with a minimum of carriage expense, otherwise made large by far distant points of supply.

Through these many distributing points it has been made easy for you to procure genuine Bosch Products, Bosch Plugs, Bosch Magnetos, etc.—the kind that satisfy and stay sold.

There is no question of value or doubt of service when you buy Bosch Plugs. They are as good as Bosch Magnetos.

Address "Bosch Distributors" at Portland, Me.; Boston, Mass.; Buffalo, N. Y.; Rochester, N. The latest Ergon Motor, Model D, 4⅜x6 replaces the timing gears by silent chain to magneto, pump and valve actuating mechanism.

The adoption of the Renold Silent Chain was decided upon after exhaustive tests which proved its efficiency.

Some of the results are: less power consumed; no vibration in the actuating mechanism it drives; no vibration in chain itself.

This feature, coupled with other elements of Ergon construction, makes the new high power, long stroke, Model D Motor one of the most economical, durable and efficient motors on the market.

Ergon motors are built for pleasure cars and trucks:

Model C, .	3¾ x 4½
Model CX, .	4 x 4½
Model D, .	4⅜ x 6

We can make prompt deliveries in large or small quantities, in any size, either independent or of the unit type.

If you are worried about deliveries, write us.

"American"

Axles of Quality

EXPERT judgment of a motor car discriminates sharply between external features which may be optional with any car, and those fundamental features that are built into it.

We don't think any one will dispute the statement that of those features which are both vital and distinctive, it is the axle that really establishes a car's class.

The satisfactory operation of any car, whether measured in dollars or in security, is based upon axle efficiency. And this is as true of a gasoline car making its own power, as it is of an electric which leaves the garage with a measured amount of latent power in its batteries.

The axle problem is wholly one of power transmission, which depends upon the material used, excellence of design and durability of construction. Judged by any one of these factors, well posted automobile engineers will frankly concede the superiority of "American" Axles.

The adoption of "American" Axles is simply a quality proposition. The owner of a car equipped with them has the assurance that nothing equally good can be bought at any price.

"American" Axles offer the option of our own perfected bevel drive or the famous Lanchester-Daimler Worm Drive

Here's The Most Modern, Efficient, Reliable Electric Starting Motor on the Market

AUTO-LITE ELECTRIC STARTING and LIGHTING SYSTEM

The Electric Auto-Lite starting motor shown in the illustration is a 4-pole, series wound, 6 volt machine, weighing 36½ lbs.

It is 8¾" long by 5¼" wide.

It may be operated in either a vertical or horizontal position.

It is compact, very simple in design, needs little attention—lubricated by grease which requires renewal only once or twice a year.

The entire outfit is enclosed.

Its construction and design is such that it may be readily adapted to practically every existing type of automobile gas engine.

This motor will spin a 6 cylinder engine, 3¾" bore by 5¼" stroke, having a compression of 60 pounds, over 100 R.P.M. (greatly above the necessary speed for positive starting), with a current demand of 135 amperes at 6 volts.

"As Sure as the Whirl of The World."

Send 10 cents in stamps for our handbook on "Automobile Electric Systems."

Other Important Details

The outfit is entirely waterproof.

The coils are impregnated, varnished, and baked.

The armature is mounted upon a very heavy shaft, accurately ground, and runs in extra large ball bearings.

The commutator is extra large.

There is no sparking at the brushes.

An uninterrupted flow of current is assured by the use of shunt or "pigtail" connections to all brushes.

The four brushes are easily accessible.

Only the best of materials are used, and the workmanship is high grade in every respect.

Has been thoroughly tested on many motor cars under a variety of conditions, and has successfully performed its function in all cases.

The Electric Auto-Lite Company

as an organization is financially and mechanically able to handle contracts of any size—to give you apparatus which will meet your requirements in every detail, whether for starting, lighting or ignition purposes.

One of the largest, exclusive manufacturers of electric lighting and starting systems in the country.

The pioneer builders of the 6-volt starting systems.

WARNING!

TWO NEW SIXES FOR POLICE

Department Strengthens Up Service Materially

Two new recruits have joined the Detroit Police department. They are Havers Six-60 cars and went into service there immediately after being purchased for duty this week. Already they have covered many miles between them in emergency flights. One of the cars is a new one for the department. They are cylinder and one powerful motor. They are painted in the usual police colors and have been put on a circuit especially because of their speed. Every car has a powerful siren on the front and two powerful searchlights on the rear. They are equipped with two-way radio sets and are remarkable cars for the purpose. They are manufactured by the Havers Motor Car Company at Port Huron, Mich.

Speedsters, Quit It!

The Detroit Police Dept. has just placed two fast, powerful Havers Six-60's in commission.

Speedsters, take this warning, for you can't beat the Havers

NEWTON.

THE HAVERS SIX

swift as the winds when needful, can be throttled down to two miles an hour on high.

The Havers Six is a big, luxurious, comfort-giving car. It is the leader in the sensibly priced sixes, for the Havers Company has been building sixes exclusively for the past four years to the everlasting satisfaction of their owners.

Of course you have noticed the constantly increasing number of Havers cars on the Detroit streets. Havers beauty and lines are hard to forget.

Take a tip from the Police Department. Investigate the Havers Six. It will save you time and money.

E. B. Newton Auto Co.

Distributors for

Havers Motor Car Co.

Detroit

Havers Six-44 $1850

Havers Six-60 $2350

The above is a small reproduction of a big advertisement announcing the installation of the Havers Six-60 as the "emergency fliers" of the Detroit Police Department.

The Havers Six is not a Detroit made car. It is made in Port Huron, and captured the "emergency fliership" in competition with a dozen of the best known local makes.

Because Detroit is the centre of the great automobile industry, we have for years kept out of this field.

Local influence; factory service; made us feel the fight would be a hard one.

But so many Detroit dealers have wanted the Havers Six, we finally took the plunge about four months ago and find the water fine.

Already you see the Havers Six—a Port Huron made car—everywhere on the streets of Detroit.

***Character—Price—Record—Appearance* will tell, even in the "centre of the industry."**

Regal

You Must Sell the Car That Fits the Average Pocketbook

Price is the big thing in the automobile market today. The prosperous dealers are the men who have analyzed rightly the automobile demand.

These men have found that cars around the $1,000 mark and below it are the big sellers. It's a price that fits the majority of pocketbooks. It's a figure that brings the buyer into the salesroom *if the door is left open.* But — *this is imperative — the winning car must combine quality with price.*

That is the combination found in

Regal Underslung Cars

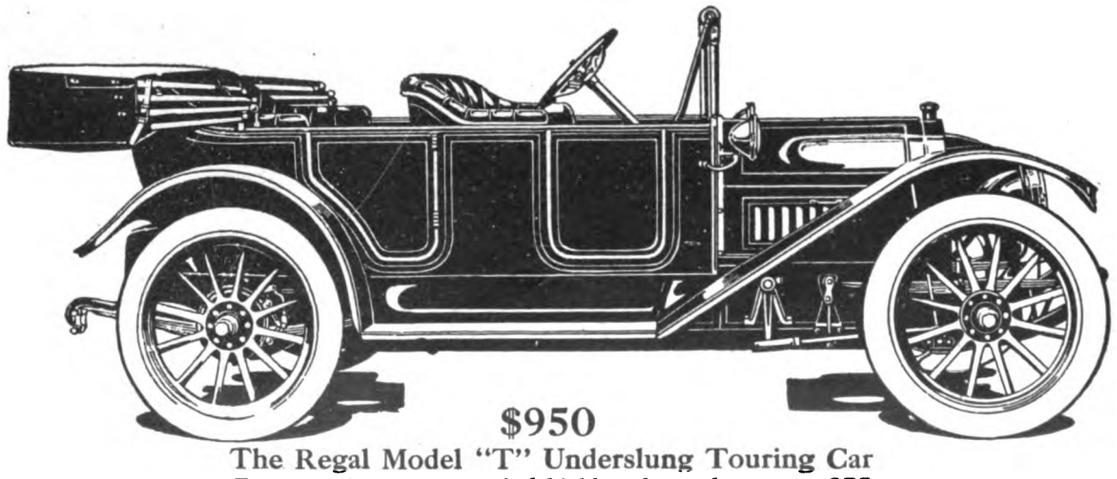
Regal dealers in every part of the world are prosperous. They have the car that fills the greatest demand in the field —

Quality Cars Around $1,000!

Superior Features of the Regal Underslung:

Thousands, experts and users, declare the Regal Underslung Cars are the safest built. The low construction reduces skidding to a minimum and eliminates the "turning turtle" danger. When fully equipped a Regal Underslung will cling to a 60 degree incline.

You can assure your customers that the Regal is unsurpassed for easy riding qualities. The underslung construction permits the use of very flat springs, everywhere admittedly the best in point of service and comfort. Regal owners know nothing of jarring and jolting. The Regal springs are attached so that the vibrating in each "half spring" is different.



Regal Cars are economical cars. They reduce tire wear and cut down gasoline bills.

The long, sweeping, rakish Regal appearance has created admiration in the capitals of the world.

We want aggressive, wide-awake dealers all over the United States. We have the car with quality and price—the car you can easily sell—the car that will stand up under all conditions and thereby build your future business.

We've got a real dealer's message for you. We want to tell you more about the Regal and the opportunities it offers you. Write for our excellent, co-operative dealers' proposition. We actually help dealers to sell cars. You can always depend on the Regal factory for service, delivery and sales co-operation. Write today. *Ask for Catalog N.*

The Accounting Department Must Justify Motor-Haulage

THE record will go down, black on white, in your books—day by day, week by week, year by year.

Will the balance be on the right side?

That depends on three things: No. 1—Does your business fit the truck? No. 2—Does the type of truck fit your business? No. 3—Will the truck stand up to the job after you get it? *Don't neglect No. 3.*

The first two have been studied and investigated, from every angle, put down in exact figures, settled definitely. *What's the answer to No. 3?*

Look to the parts that carry the load

When the giant truck rumbles past you over the cobblestones, don't look merely at the body, *look beneath.* That's where the load comes—on the axles and their bearings.

Take a five-ton truck, for example, it weighs about 8,000 pounds, its load, 10,000 more. *Nine tons supported by the four axle* spindles!

Only long years of experience and the devotion of an entire great organization to axle-building can safely determine the size and design of those spindles, the selection and heat treatment of the steel.

It is because Timken-Detroit Axles are made by such an organization that they are standing up under so many thousands of motor trucks today, both electric and gasoline driven.

750 lbs. on a ⅝-inch roller

The nine tons rest also on the ⅝-inch rollers in the eight Timken Bearings on the four axle spindles.

And not on all of the rollers at that, because only one-fifth of the 120 rollers in the eight bearings, or 24 rollers, are actually under the load at any one time.

Think of it, nine tons on 24 rollers. 750 lbs. on each!

But Timken Tapered Roller Bearings carry this load—what's more they take the tremendous side-pressure when corners are turned, the pound and jolt of the rough roads, the extra stresses due to careless driving.

All the conditions have been foreseen by Timken Engineers—and they have established a factor of safety far enough above the 750 lbs. to *make sure of emergencies.*

Building truck axles and bearings that stand up to the work

Timken Engineers have built on the experience of all motor-truck designers and builders, domestic and foreign.

They have minutely tabulated records of their own experience, going back before the first practical conception of motor-haulage.

Timken Engineers have at their service two great organizations whose only occupations and ideals are to build the best possible axles and bearings for pleasure and commercial cars.

They can help you answer that third question with a "Yes."

You will find the whole story of axle and bearing importance—for pleasure cars as well as motor trucks—in the Timken Primers No. T-1 "On the Care and Character of Bearings," No. T-2 "On the Anatomy of Automobile Axles." Sent free, post-paid, from either address below.

Hartford Cone Clutches

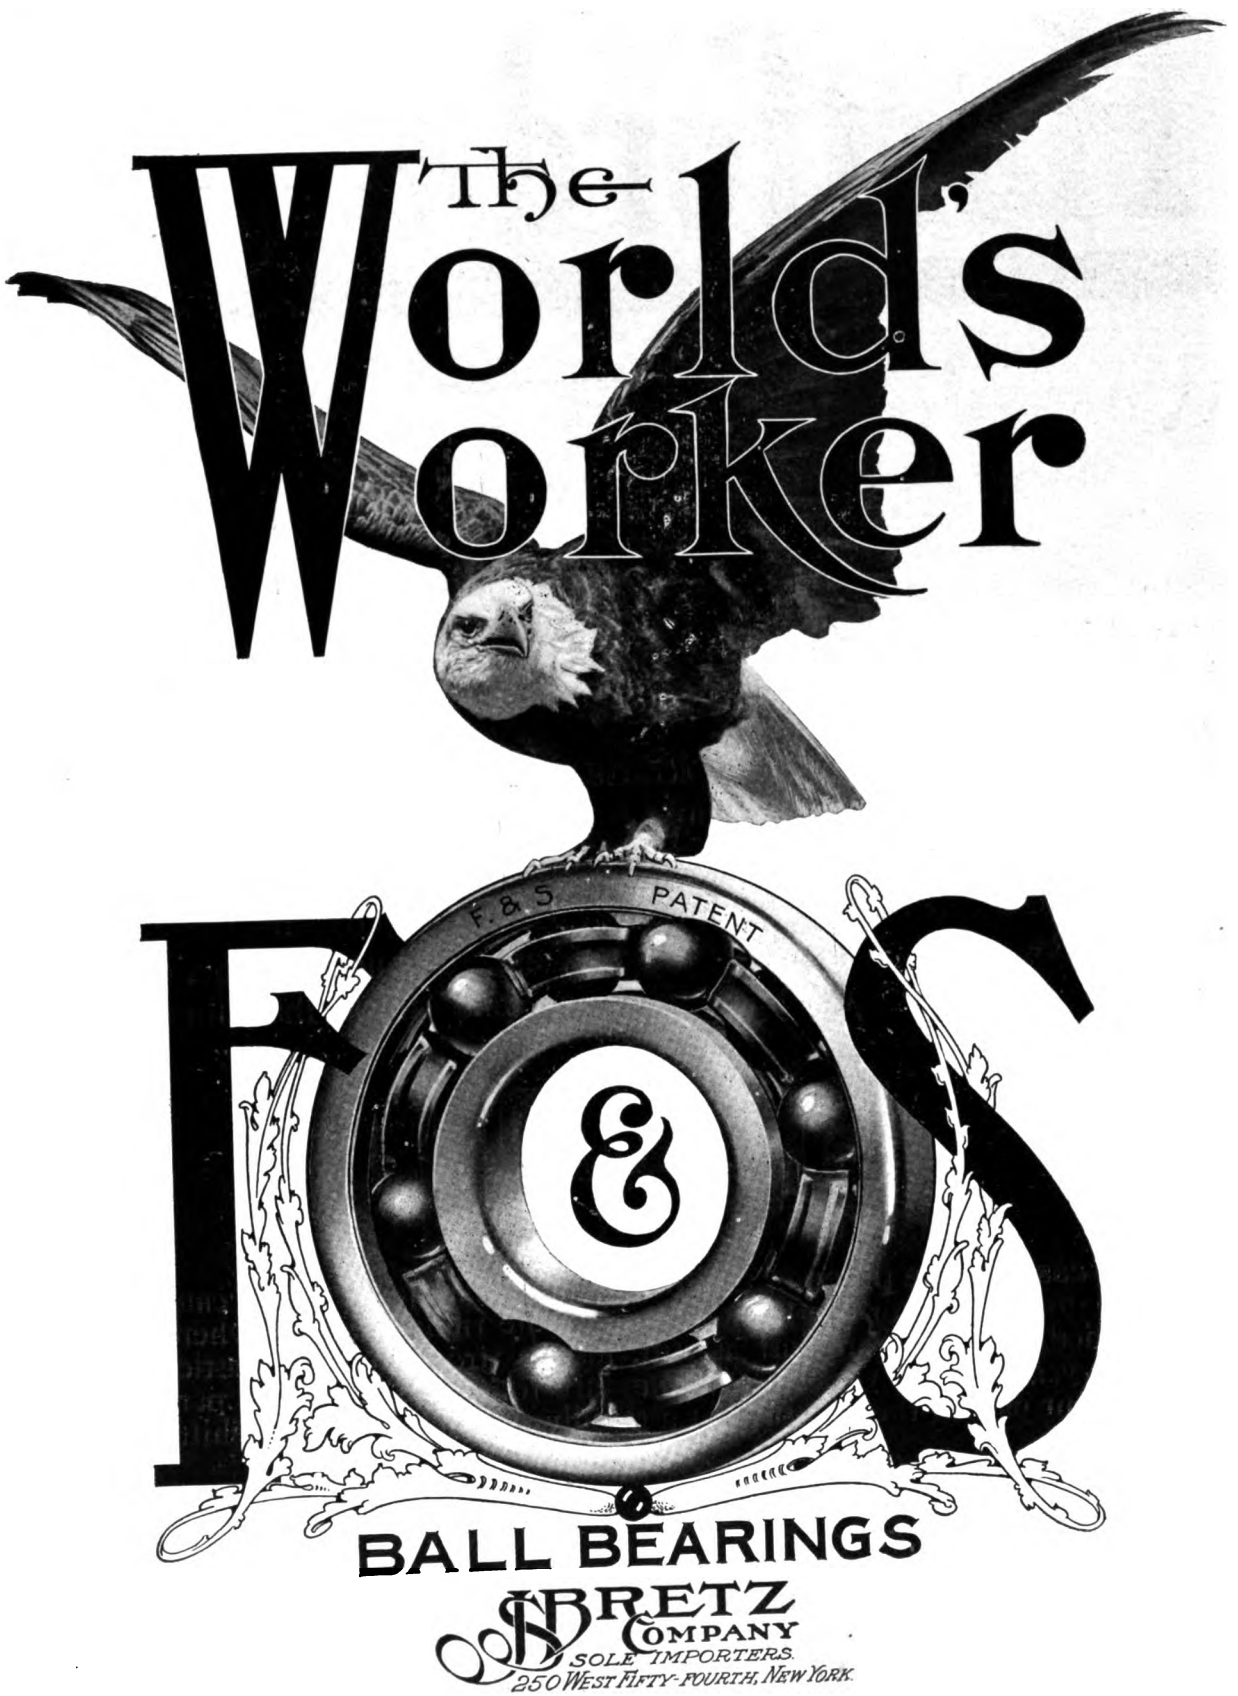
WHAT is the advantage of specialization?

Couldn't we make exactly as good a clutch if our time and energies were divided and applied to several problems?

Could we turn out several products of uniform excellence as promptly as our special machinery enables us to do with our chosen specialty---cone clutches?

Can any manufacturer, using only standard machinery, compete with us in our chosen field in quality, price or prompt deliveries? Can the manufacturer who makes several different products stand the investment in special machinery for each of several lines and still maintain the quality of materials and workmanship that characterizes Hartford Cone Clutches?

In the manufacture of cone clutches, where parts must be interchangeable, and where the percentage of accuracy required is generally one hundred, special machinery with its complete equipment of dies, jigs and tools is as necessary to the manufacturer's success as to the success of his product.



In the shops where Hartford Cone Clutches are made there is a better equipment of special machinery for the manufacturer of cone clutches than in any other we know of. We have always specialized in cone clutches and our men have been trained in this particular kind of work.

Standard Hartford Cone Clutch Unit Complete with Universals. This is the Type Clutch We Have Specialized in for Years.

RESILIENT? YES!

More resilient than wood wheels!

—**because, for equal loads carried, steel truck wheels** have smaller hubs, fewer spokes, and no felloe to check resiliency.

Where medium to heavy loads are concerned the characteristics of built-up wood wheel construction require that the spokes be made so short and thick that their resiliency is lost.

SHELDON
STEEL WHEELS

are cast in one piece of the toughest crucible steel. They cannot shrink, rot, or work loose. They are ribbed exactly where needed, and they are just as stiff, just as strong, just as elastic, next year and the year after as they are today. They are a permanent part of the chassis, not a rapidly deteriorating makeshift.

Allow us to quote on your axle, spring and steel wheel requirements.

interest we can only hope that the law makers heeded the advice of those who are in the best position to understand just what such legistation would mean to a most important industry.

Kelly-Springfield Record.

Of historical interest to the American industry is the three-ton Kelly truck pictured on this page, which has traveled more than 21,000 miles and according to the owner is still going strong. This chassis contains one of the first water cooled engines built by the Kelly-Springfield Motor Truck Co., of Springfield, Ohio. Before it was sold to its present owner it was put through a strenuous factory and road test, aggregating 18,000 miles. It was then taken down and, the builders tell us, there was not the slightest sign of wear visible anywhere. The truck was then reassembled and sold to the Wagner Company, in whose service it has covered 3,000 miles more.

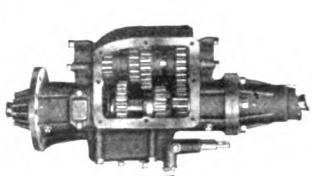
Ajax Not to Drop Mileage Guarantee.

In response to many inquiries the Ajax-Grieb Rubber Company recently announced.

A Kelly truck, which has made an excellent record for long distance traveling, having more than 21,000 miles to its credit. See note on this page.

COVERT

This 3 ton Kelly Truck was driven 21,000 miles. 18,000 as a factory test car and then 3,000 miles in the hands of the present owners.



A stock model "K" Covert Transmission has taken the strains and stresses of this 21,000 miles of hard work.

In long, hard service of this kind the transmission receives more strenuous usage than any other mechanical part of the car.

It certainly speaks well for the design, material and workmanship. The Covert Transmission has not shown any sign of wear in all this service.

This is only one instance of the service given by the thousands of Covert Transmissions in use today.

If your transmission equipment has caused you trouble, be on the safe and sure side. Covert Transmissions will end your worries.

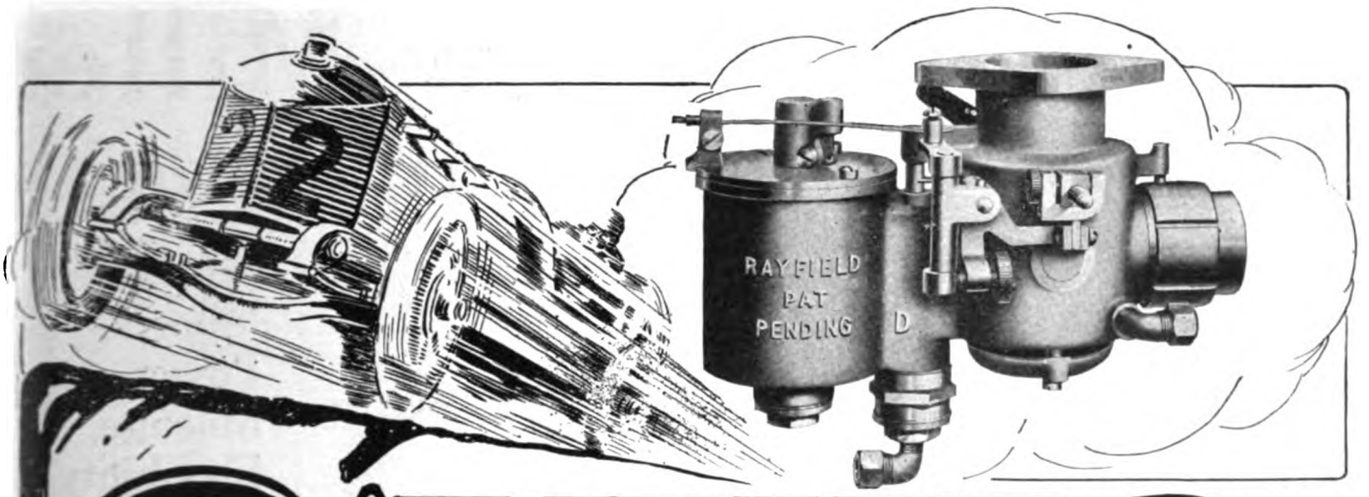
SPRINGFIELD
CONVERTIBLE BODIES

Springfield Convertible Bodies are the embodiment of refinement in the matter of lines, material, finish and ease of adjustment.

The runabout convertible body shown here illustrates one extreme of a line that goes on up to the highest grade limousine, landaulet and town car.

Even this faithful reproduction cannot approximate the beauty and convenience of the equipments as they actually appear. They must be seen to be fully appreciated.



The ease of operation is remarkable; the tops are rapidly raised into position, the doors are opened, the hinged glass swung up into position, the remaining windows are removed from a box in the back of the front seat and buttoned into position, completely enclosing the car in less time than an ordinary top can be erected and the curtains adjusted.

Write for brochure of reproduced photographs.

RAYFIELD CARBURETOR

Supreme in the Fierce Test of Racing
Supreme in the Grind of All-Around Service

The "SPEED KINGS"—all of them—KNOW that the RAYFIELD is the fastest carburetor on earth, because THEY USE IT AND WIN RACES, and the Rayfield **wins more races than all other carburetors combined.**

It isn't coincident nor an accident that causes the Rayfield—on any make of car, under all conditions, for every equipment—to consistently, unfailingly demonstrate **positive efficiency—superiority.**

The man who designed it **knew** motor construction, **knew** the possibilities of gasoline combustion, knew the REQUIREMENTS of a carburetor better than anyone else did; and he finally produced a **perfect carburetor**—the RAYFIELD—which gets the **maximum energy out of every atom of gasoline.**

That's **why** it wins races—or throttles down to a snail's pace without a skip.

By getting **all** of the power out of one drop of gasoline, it doesn't have to borrow any power from the second drop; that's why it pushes a car farther on one gallon of gasoline than other carburetors do, all of which means one thing—"More motor car service for less gasoline," and that spells **ECONOMY.**

A thirty-day trial will convince you. It is yours for the asking

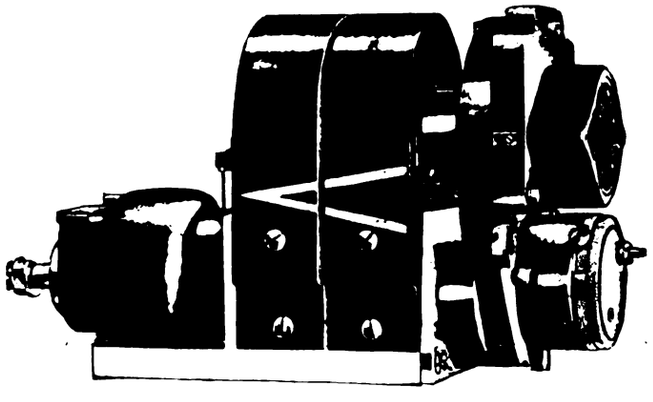
EISEMANN

Not only are Eisemann magnetos a "sales asset"—but they are the best sort of "service asset" as well.

Unquestionably, the most emphatic endorsement of the real merit of Eisemann products is the adoption of Eisemann ignition by so many leading truck and car manufacturers in this country. Particularly is this true as regards the use of Eisemann ignition on heavy duty trucks.

In this field service counts—your ignition must make good—you must give service. Eisemann magnetos do give service. That's why we say they are a "service asset" as well as a "sales asset."



Won't you let us demonstrate the truth of this to you, actually.

New Miller Carburetor

Means More Power, Mileage, Flexibility On Your Car

What It Actually Does

Takes care of any grade fuel from gasoline to distillate.
Adjusts from seat for all weather conditions.
Throttles down without knocking.
Gives maximum power on low, intermediate and high.
Mechanically adjusted by throttle opening or closing.

The New-Miller Proposition

Once the New-Miller carburetor is set on your motor, no further adjustments are needed. All subsequent changes made necessary by difference in altitude, winter or summer weather, good or bad gasoline, can be made from the seat.

The slightest movement of the throttle gives a positive movement to the auxiliary air and gas needle. This means real carburetor service.

New-Miller carburetors are manufactured by specially designed machinery, machined to one-thousandth inch, subjected to a rigid inspection, and tested on all types of motors. Every unit in a million of them would be interchangeable.

Saves Its Cost In One Season

A season's use will easily save you fuel and repair expense to pay for a New-Miller and freedom from carburetor troubles on your car. You can prove this for yourself if you will send for the New-Miller Booklet and go over it carefully.

Save 1 Man's Salary

WITH

WEAVER

Auto Twin-Jacks

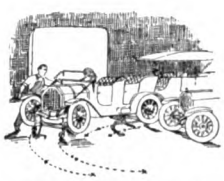
AN equipment of Weaver Auto Twin-Jacks will save from one to three men's salary in any public garage, repair shop, or auto livery in the country.

These jacks are the only device which will enable one man to handle a car with absolute ease when the engine is dead.

Push the car sideways—turn it completely around within its own length—cut it in at right angles—in fact any manipulation desired can be accomplished in a few seconds' time.

A Time Saver in the Repair Shop

In repairing or overhauling a car to the best advantage, Weaver Auto Twin-Jacks are indispensable. Dismantled cars can be readily shifted around, as desired. And there is no danger of the car falling and injuring the workmen. Absolutely safe, substantial and dependable.



Ball and Roller Bearing

The casters and lifting mechanism are ball and roller bearing throughout. The heaviest pleasure car can be raised with ease. Lifting leverage of 400 to 1—34-inch wheel base—wheels have 2-inch face—weight of each jack complete, 47 lbs.

Get Weed Tire Chains at Once!

"I know you are a careful driver, but it is best to adopt every device to *prevent* accidents.

"I can't afford to take *any chances.* We have all foolishly depended on rubber alone long enough. It's time to awake to our responsibility. So go at once and buy a complete equipment of *Weed Chains* and never start out without them when the roads or pavements are slippery or greasy."

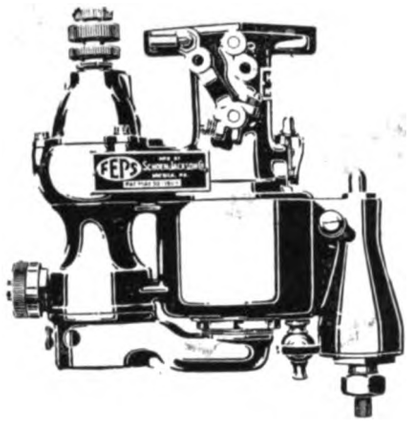
Weed Anti-Skid Chains

Insure Against Anxious Moments

Probably no other device has done so much to raise the factor of automobile safety as WEED CHAINS. They are the proverbial "ounce of prevention" against skidding, the cause of over ninety per cent of all automobile accidents—*Life Insurance* and *Accident Insurance Companies* strongly endorse them and recommend their use. *Taxicab Companies,* for their own protection, *insist* that their drivers put them on when the streets are wet or slippery.

Increasing Demand

for WEED CHAINS makes them the *most profitable* Automobile Accessory handled by Dealers—Quick and Steady Sales—No Dull Seasons—No Dead Stock—Easily Handled—Liberal Profits—Universal Satisfaction.



Attractive, convincing, decorative, lithographed hangers supplied to dealers upon request.

"A Giant in Power FEPS —a Miser in Fuel"

The experience of one FEPS dealer:

SCHOEN-JACKSON CO.,
Media, Pa.

Gentlemen:—

. . . . . We are continuing to get repeat telephone and mail orders for carburetors and an order of this nature for one carburetor always looks better to the writer than double the number of new sales, as it is the best indication we can have that the carburetors are rendering satisfactory performance. The results of our work to date have been indeed gratifying. We have now reached a point where Feps owners frequently call in person or on the telephone and tell us what a fine article we are selling.

In this connection we might state that out of over 200 Feps which we have now installed only one has been returned for credit. . . .

Thanking you for your past courtesies and with best wishes for a big year, we beg to remain,

Very truly yours,
MOTOR SUPPLY SHOP, INC.

SPLITDORF

"Always There"

Investigation by Commission

may have its advantages from a Congressional standpoint, but PERSONAL INVESTIGATION cannot be surpassed as a means of obtaining a real intimate knowledge of the superior qualities of SPLITDORF SPARK PLUGS.

And SPLITDORF PLUGS will come through any and every personal investigation—no matter how thorough, or how searching—with the unqualified endorsement of: "THE BEST SPARK PLUG ON THE MARKET."

There's no dodging the issue—the SPLITDORF ELECTRICAL COMPANY is bigger and better that ever—it GUARANTEES ITS PRODUCT and stands committed to every claim it makes for the goods bearing its trademark.

A PERSONAL INVESTIGATION TODAY will convince the most skeptical that the SPLITDORF SPARK PLUG, with the hexagonal porcelain, and with the SPLITDORF trademark stamped on the shell, is the commonsense plug for every-day usage gas-tight, soot-proof and unbreakable.

Remember, All! "New ignition for old" is our slogan--We have a SPECIAL EXCHANGE proposition of the greatest interest to every owner of a gasoline motor who would save time and money. Write or call TODAY for particulars.

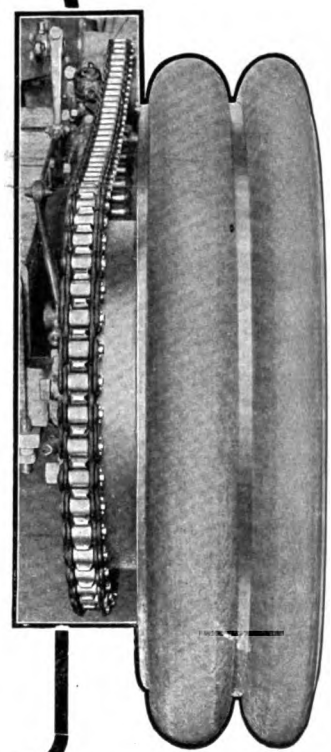
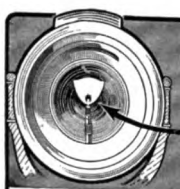
"WHITNEY" Chains

WE call your attention here to "Whitney" Cotter Detachable Chains as the most practical chains ever offered for motor vehicles. They have made a record for themselves which no other Detachable Type has approached.



This Cotter Pin feature is so practical and necessary that it calls for little detailed explanation. The illustrations tell their own story, proving that this form of construction is logical and necessary for chain equipped motor vehicles. This Cotter Detachable Chain can be taken apart at any link and lengthened, shortened or repaired without the use of any special tool, as the Cotter Pin can be removed with pliers, screw driver or any sharp pointed instrument. The use of "Whitney" Cotter Detachable Chains assures the builder, owner and driver of commercial vehicles uninterrupted service on account of the ease of repair.



"Whitney" Chains are made from steel best adapted for the purpose, carefully hardened and calculated to resist the most wear, while in the matters of machining and assembling the utmost care is exercised and thorough inspections and tests characterize each process of manufacture. Their future service, however, depends upon the accuracy of sprockets, care, lubrication, alignment and adjustment, for the best chain in existence cannot withstand the evil influence of improper conditions and give best results.

Write for our illustrated catalog which shows top and side views of each size of all Roller chains manufactured by us.

"Whitney" Chains Are Built for Strains

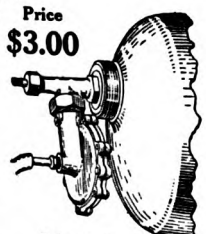
The flame is always just this high when you use

The Prest-O-Lite
Automatic Reducing Valve

With this device attached to your Prest-O-Lite, you do not have to turn the tank valve up or down to get the correct flame in the lamps.



Turn on the gas, light your lamps, and the flame is bound to be just right, without any adjusting.

It pays for itself in gas saved, so its convenience costs you nothing.

Unlike other reducing valves, the Prest-O-Lite Automatic gives the correct gas pressure at all times, whether the tank is full, half full, or nearly empty. It is truly automatic in its action.

Anyone can attach it in less than five minutes.

Price **$3.00**

Your dealer has it or will quickly get it for you. If not, we'll send it to you on receipt of price. Try your dealer first. Every Prest-O-Lite Branch Office has this Automatic Reducing Valve in stock.

Business Promotion Through Trade Press Efficiency

is to be the keynote of the most notable gathering of technical, class and trade journal editors and publishers ever held in America. No live manufacturer, sales manager, advertising man, trade paper editor or publisher can afford to overlook the

Eight Annual Convention of the Federation of Trade Press Associations in the United States at the Hotel Astor, New York, Sept. 18, 19, 20, 1913

Two sessions will be held daily. There will be editorial, circulation, advertising and publishing symposiums under competent leaders. Many of the leading editors, business managers, buyers and sellers of advertising, and authorities on modern merchandising methods will take part. On Friday afternoon, September 19, there will be a mass meeting with addresses by representative business and professional men, on subjects of timely interest to editors, publishers and advertisers. Distinguished guests and worth-while speakers will be at the annual banquet, which will be made a memorable social occasion. No matter what may be your connection with the trade journal field, if you are interested in the idea of business promotion through trade press efficiency, if you believe in business papers for business men, you will be welcome at all sessions.

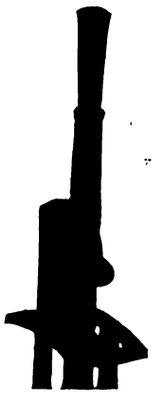
IDEAL STEEL WHEEL (RESILIENT)

STRENGTH COMFORT BEAUTY ECONOMY

IT'S IN THE SPOKES

ANNOUNCEMENT TO DEALERS

We have hundreds of inquiries from automobile owners who want to buy our wheels because they solve the tire problem and double the life of all tires, at the same time making the car ride with luxurious ease. These inquiries are from all sections of the country. With our present distribution we are unable to handle them to advantage.



If you are in a position to handle our wheels and to give demonstrations of them we can offer you a liberal selling contract with exclusive territory and no competition. Ours is a free-trial, money back proposition to the consumer. For the dealer it means quick turns of the small amount of money invested and unusually attractive profits.

Write immediately and get the advantage of our extensive summer advertising.

THE IDEAL STEEL WHEEL COMPANY

1084 First National Building CINCINNATI, OHIO

Digitized by Google

Stop Tempting Sneak Thieves

You can put a Hercules Auto Lock on the car of every one of your customers and guarantee them against theft, and also pocket an attractive profit into the bargain.

The Hercules automatically locks the transmission lever in neutral.

Guaranteed thief-proof and easily attached to any car.

Consumer advertising and good profit make it a real live proposition for the dealer.

Retails at $5 00.

Some territory open for distributors. Live dealers can obtain full information from

TRIPLEX

A FUEL SAVER and A MONEY SAVER

Increases Power Decreases Cost

The Triplex is a device placed between the manifold and the carburetor to break up the mixture. No matter how imperfectly the carburetor does its work, the Triplex equalizes the mixture, producing an explosive gas of even, uniform quality that will burn clean to the last atom. This means that the user gets all the power all the time—that every fraction of energy to be obtained from the gasoline is produced and used. There is absolutely no waste. High proof gasoline is made out of low, and over 25% is saved on every gallon. For further information write us.

BREMER-WILSON MFG. CO., 1421 Michigan Ave., Chicago, Ill.
AUSTERMELL & HANSON,
560 Phelan Bldg., San Francisco, Cal., Western Representatives.

THE OTTO KONIGSLOW MFG. CO.
3510 Perkins Avenue
CLEVELAND, OHIO
Detroit Office: J. H. GOULD, 1202 Majestic Bldg.

DEALERS: A million motorists will have tire trouble in 1913. There is a demand for a **reliable**, inexpensive vulcanizer that can be used by anyone, anywhere—a vulcanizer that will mend tube punctures as perfectly as the most elaborate plant.

VUL-KIT VULCANIZER REPAIR KIT $2

The only inexpensive vulcanizer that actually **vulcanizes** a repair clear through because it is the only one in which the vulcanizing temperature is maintained long enough to cure the raw rubber. Its ever-present fuel, gasoline, is converted into a gas by the patent generator which distributes the flame over the vulcanizing surface at just the right intensity.

Other exclusive Shaler features are a handle that is cool enough to permit moving the vulcanizer the moment the repair is finished, asbestos plate inlaid in tube shelf to retain heat and prevent pinching tube, and universal clamp insuring even pressure to all parts of a repair.

A Real SHALER Vulcanizer

Not an experiment, but the product of the largest exclusive vulcanizer manufacturers in the world. Sold under the Shaler guarantee which has made the Shaler line of vulcanizers for motorists and repairmen the standard throughout the auto industry.

Get our trade proposition

Write today and get full details and trade prices on this indispensable accessory. Sooner or later every motorist will get a VUL-KIT from someone.

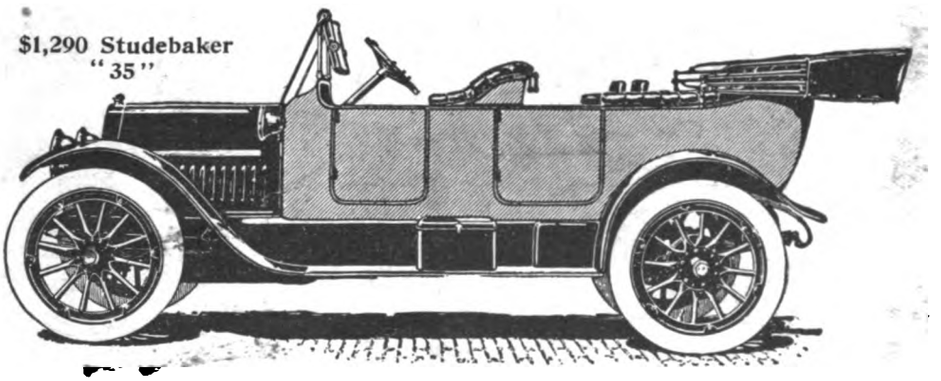
Studebaker

The Selling Power back of the Studebaker Cars

NO Studebaker dealer has to introduce his goods. Almost everywhere the name STUDEBAKER is familiarly known and trusted.



The road between dealer and buyer is absolutely straight and clear. Studebaker dealers frequently do not even have to demonstrate their cars. They are selling a standard article of well known quality.

The selling power back of such a demand is tremendous.

If it were humanly possible for a new car to be put on the market today equal to a Studebaker car in price and quality, the Studebaker car, nevertheless, would sell over it nine cases out of ten.

That is what a well-known reputation earns.

And that is the reason, too, why a contract to sell Studebaker cars will always be sought for. The dealer's market is more responsive, his work easier and his profits far more certain.

Vol. XXXVI
No. 2

New York, July 3, 1913

Ten cents a copy
Two dollars a year

The ELECTRIC DISCO System
STARTING—LIGHTING

Motor Car Builders Won't Make This Costly Mistake Again

Some makers of motor cars had to learn **by experience** that it doesn't pay to equip with just any electric starter.

They won't make such an expensive mistake again.

Henceforth they will look into this Electric Starter Proposition **carefully** and give it the consideration it deserves.

They will perceive that, even though it costs them more to put on the very finest electric starter, they save money by doing it.

The manufacturer who equips with the **Electric Disco** doesn't have to hire an army of mechanical experts to travel around the country fixing his customers' cars.

For the **Electric Disco** not only works perfectly when new, but **keeps on** delivering satisfaction.

A number of the leading manufacturers have closed with The Disco Company for equipment for their 1914 cars. Watch for the 1914 announcements of motor builders and note the preponderance of cars that will be equipped with the Disco for 1914. They all appreciate, after having had some experience, the value of using this device.

Spinning vs. Turning

Observe the Electric Disco on your friend's **car.** Note how it **spins** his motor.

It doesn't merely turn over the engine. It makes the engine fairly "whiz." Gives an immediate speed of 150 R. P. M.

Think what that spinning means when your motor is dead and the oil is stiff. There's no delay nor wait. The very **moment** you press the button you are **under way.**

A Book for You

We have a handsome, new Book on Electric Starters. We are sending a copy of it to every motorist we know. Over 15,000 motorists have already sent for it and have been able to immediately appreciate the supremacy of the Disco and their demand to the manufacturer and dealer is working a tremendous effect on the equipment for 1914.

If you haven't received your copy, it is because you have not sent your address. Please do so at once. We will forward the Book by return mail.

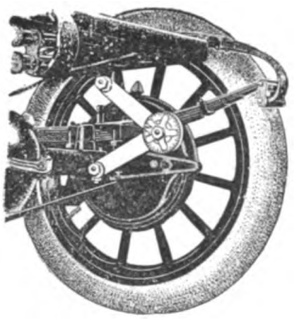
New "MacFarlan Six" Fitted with Truffault-Hartford Shock Absorbers

Pursuing a policy of long standing, the MacFarlan Automobile Company has again decided on Truffault-Hartford Shock Absorbers for their new model.

This model—soon to make its appearance in the showrooms of MacFarlan dealers—possesses many new features, including a "T" head motor of remarkable power, a self-starter, electric lights, extra large tires, and full elliptic springs on the rear with Truffault-Hartford Shock Absorbers both front and rear.

The use of full elliptic springs on a car of the MacFarlan's size and weight would be quite out of the question without the supplemental use of Truffault-Hartfords.



Truffault-Hartfords supply the necessary restraint and reinforcement for this type of spring, and give the MacFarlan a riding ease justly comparable with the smooth running of a Palace Pullman car.

Attachable to any car without marring its appearance, the

Truffault-Hartford
SHOCK ABSORBER
"The Pioneer Shock Absorber"

adds to its value by making riding comfortable under all road conditions.

The MacFarlan Company is one of the pioneers in six cylinder car construction and a concern of sixty years' standing in horse-drawn vehicle manufacture. As such, its re-adoption of the Truffault-Hartford, year after year, is strong evidence of the superior merit of this device.

Vol. XXXVI New York, U. S. A., Thursday, July 3, 1913 No. 2

WINTON ADOPTS LEFT DRIVE; ADVANCES PRICE SLIGHTLY

Pioneer Manufacturer Makes Many Changes in Car but None of a Radical Nature—New Price $3,250.

Hereafter, all Winton cars will have the steering wheel at the left side, instead of the right, with the control levers in the center of the footboard, affording right hand control. Coincident with this change and the adoption of several other new features of a less radical nature, including an increase in the engine size from 4½ x 5 to 4½ x 5½, the price of the touring models has been advanced from $3,000 to $3,250. It goes almost without the saying that all Wintons will be "sixes," as has been the case for the past five years.

Although the change in the position of the steering wheel alters slightly the general appearance of the car, its lines remain practically unaltered, except that the usual side lamps have been eliminated, their place being taken by small auxiliary bulbs placed within the head lamps, and that the door handles and hinges have been concealed. Other changes in construction which have been made, while none the less important, scarcely are visible. Thus, for instance, the distinctive Winton method of obtaining pressure for the air engine starter from the engine cylinders has been discarded and a four-cylinder Kellogg air pump substituted for it; also, a complete Gray & Davis electric lighting system has been substituted for the Prest-O-Lite tank and storage battery formerly included in the equipment. Another important change in the chassis lies in the elimination of the radius rods; their function now is performed by the rear springs; at the same time, the front springs have been lengthened and the frame strengthened to increase the factor of safety. To increase stability the frame and all it carries has been lowered, and the effort required to operate the car has been reduced by increasing the clutch release.

Other alterations include the installation of the speedometer, clock, ignition switches, etc., on a cowl board instead of on the dashboard proper and the employment of a primer, to facilitate starting which is operated from the cowl board. By way of enhancing appearance, the radiator has been made of German silver and all the exposed metal parts are nickeled. Equipment has been increased by the addition of a mohair top with side curtains, rain-vision windshield, Klaxon horn (beneath the engine hood), Warner speedometer, and a Waltham eight-day clock, all of which is in addition to the usual demountable rims, bulb horn, tools, etc.

Court Refuses to Approve Warren Sale.

When the assets of the bankrupt Warren Motor Car Co., of Detroit, were offered for sale by the receiver on Thursday last, 26th ult., W. C. Rands, of the Rands Mfg. Co., offered $104,600 for the real estate, two factory buildings and the machinery therein. As his was the best bid, Rands was congratulating himself on securing a bargain but when the sale came before the court for confirmation it was found that there was something illegal in the transaction and the court, therefore, refused its approval. Efforts are being made to untangle the knot and it is possible that a decision may be rendered today as to whether Rands's offer shall be amended or the sale of the property reopened. If Rands gets the plant, it is his purpose to move in and greatly enlarge his business of manufacturing windshields and tops and also to increase the capital of his company.

Durant-Dort May "Go Into" Cars.

The Durant-Dort Co., of Flint, Mich., which is one of the biggest producers of low-priced buggies in the world, is contemplating the manufacture of motor cars. The company already makes a low-priced motor wagon.

NEW YORK GARAGEMEN RUN AFOUL OF MORE OBSTACLES

Can't Maintain Establishments Adjoining Schools, Theaters or "Movies" —Test Case Results Adversely but Will Be Appealed.

If a decision which was rendered this week in the Supreme Court for New York county is upheld by the higher tribunal, metropolitan garagemen whose businesses represent something like $4,000,000 will be seriously affected if not entirely forced out of business; the decision took the form of a refusal to grant to James McIntosh permission to operate his garage at 130 West 102d street on the grounds that it comes within the prohibitions of Section 370 of Article 11 of the city ordinances, which went into effect January 3, 1912. The ordinance provides that no garage shall be operated within 50 feet of a schoolhouse, theater or other building used for such purposes, including moving picture shows.

McIntosh has been in business for ten years, and while he says he is not worrying as to the outcome, the court's decision in effect says that he must move or go out of business, for he is within 50 feet of a schoolhouse, which is prohibited by the ordinance; he had a permit when he started in business, but was obliged to get a new one under the new ordinance and his application has been on its way through the court for about a year. Now it is denied the New York Garage Association will carry the matter to an appeal; Theodore K. McCarthy, the association's attorney, states that it is hoped to bring about a more just arrangement regarding garage permits.

"As it is now," he said, "there is nothing to prevent a moving picture man opening up a show within 50 feet of a garage and then, when the garageman wants a new permit he can't get one. The garage may represent an investment of $75,000 or $80,-

Digitized by Google

000 and the moving picture show but $5,000, but as the ordinance now stands the moving picture show can force the garageman out. We also contend that a garage across the street from a schoolhouse is more dangerous, so far as a fire panic is concerned, than one within 50 feet but separated by another building, but the ordinance rules out the one separated by another structure and will permit one directly across the street, provided it is without the 50-foot limit.

"It is our contention that the Fire Commissioner should have the power to grant these permits and should investigate each case and decide upon the separate conditions. The construction of the garage, its fire walls and other features, should be considered, whereas the 50-foot rule is the sole guide now and is very arbitrary and unjust."

Louis J. Joscelyn, president of the New York Garage Association and the operator of the largest garage of its kind in New York, said the association would contest the matter to the end and endeavor to secure a more satisfactory ordinance.

This case is regarded as a test case, and few other garagemen are likely to be disturbed until the matter is adjudicated.

The ordinance in question also provides that no garage—storage of volatile inflammable oils is the way it expresses it—shall be permitted in an apartment, tenement house or hotel; there are a number of salesrooms so located in New York, but these are not affected, since they do not store gasolene as does a garage.

The Garage association also expects to obtain a decision next week in its fight against the rule requiring the installation of a gasolene separator, a device designed to prevent gasolene and oil from getting into the sewers; the garagemen claim these devices are very expensive and do not do the work for which they were designed.

Ford Charges Price-Cutter with Contempt.

Growing out of the suit instituted by the Ford Motor Co. against the Union Motor Sales Co., of Cincinnati, Ohio, Ohio, for infringement of Ford patents by cutting the price of Ford cars, O. D. Noble has been charged with contempt of court in that he violated the temporary injunction obtained by the Ford company, which restrained not only the Union Sales company but everyone connected with it.

Noble, according to the Ford charges, was connected with the Union Sales establishment, but, nevertheless, is continuing the price-cutting tactics. In his own defense, Noble swears that he is conducting an independent business of his own and that he is in no way related to the Union Sales company or a party to its litigation.

"SUPPLY AND DEMAND" CUT "GAS" CENT IN NEW JERSEY

Reasons Which "Accounted for" Rapid Rise in Price Now Used to Explain Reduction—No Relief in New York, However.

Despite the fact that there is no evidence that the supply has increased, while there is every evidence that the demand has increased, those good old excuses which were worn threadbare during the period when the price of automobile fuel was advanced from 9 to 17 cents, the Standard Oil Co. of New Jersey has reduced the price of gasolene in that State from 16 to 15 cents within the last month. The reduction was made in two drops of one-half cent each, the latest reduction being made last week.

Fifteen cents is the Newark price and does not hold throughout the State, since under a new law in New Jersey the price is governed by the distance of the customer from the point where the price is made. However, the reduction applies to all the varying rates. Thus, in the neighborhood of Hoboken the price is now about 15¼ cents a gallon, where before the drop it was 16¼ cents or thereabouts. When asked the reason for the decrease in price the Standard Oil answer was "market conditions," which corresponds in a measure to the "supply and demand" argument when prices went upward.

Although New York City is "just across the river" from Hoboken, the "market conditions" evidently are not of the same sort, as no reduction has been made, the price to garagemen still standing at 17 cents.

Miller Rubber Doubles its Capital.

The Miller Rubber Co., of Akron, Ohio, has increased its capital stock from $1,000,000 to $2,000,000. Of the added $1,000,000, $500,000 is represented by 7 per cent. cumulative preferred stock, which will be first offered to the stockholders, and after they have exercised their option the unsold portion will be offered for public subscription. The additional $500,000 common stock will be held in the treasury. The new money will be utilized in the enlargement of the business, which enlargement is visible in the form of new buildings which will double the Miller floor space and production.

Knight-Argyll Litigation is Ended.

Although at one time it was intimated that the Knight & Kilbourne Patents Co. was not entirely satisfied with the decision and subsequent appeal granted Argylls, Ltd., in the suit instituted by the Knight interests for alleged infringement of the Knight patents by the Argyll company, and that it might carry the case to the court of last resort, the litigation has been amicably settled out of court. By mutual agreement, the Knight & Kilbourne company has accepted as final the judgment of the Court of Appeals, rendered in April last and holding the Argyll engine to be no infringement of the original Knight patents.

Day Utility Finds Support in Spokane.

After indifferent existence in Detroit, the Day Utility Car Co., of that city, has found financial support in Spokane, Wash., and is making ready to remove, bag and baggage, to the other side of the continent. The company undertook to build a combination pleasure and commercial car, but made very slight headway, not merely in the actual marketing of cars but in the sale of its stock, which several months since was offered to the public in glowing terms. It is stated that removal to Spokane is the direct result of an investigation in Detroit conducted by a committee representing the Spokane Chamber of Commerce.

Croxton Must Pay Croxton-Keeton Note.

Owing to the fact that Herbert A. Croxton endorsed a 30 days' note for the Croxton-Keeton Motor Car Co., of Massillon, Ohio, June 25, 1910, judgment was taken against him this week in the new York City Court by the Grant-Lees Gear Co., successor to the Grant-Lees Machine Co., of Cleveland, Ohio. The face of the note was $817 and but $135.48 was paid, leaving a balance of $681.52. The judgment, including costs, is for $835.15.

Rate on Frames Declared Excessive.

In an unreported opinion, the Interstate Commerce Commission has held that a rate of 1½ times first class applied to shipments of iron automobile frames from Plattsburg, N. Y., to Portland, Ore., is unreasonable and excessive to the extent that it exceeds the second class rate, which is to become effective on or before August 15; the latter rate is to be kept in effect for a period of not less than two years from that date.

"Vulcan" Swinehart to Make Truck Tires.

C. A. Swinehart, one-time sales manager of the Swinehart Tire & Rubber Co., of Akron, Ohio, has acquired an interest in the Vulcan Rubber Co., of Erie, Pa., of which he has assumed the general management. Heretofore the company has produced only mechanical rubber goods and inner tubes, but it is its immediate purpose to take up the manufacture of the truck tire designed by Swinehart himself.

Digitized by Google

NO INDICATION OF LET-UP IN EXPANSION OF EXPORTS

Record for May Discloses Half-Million Gain in Cars, Parts, Engines and Tires—Imports Continue to Fall Off.

The export of cars, parts, engines and tires to foreign countries during the month of May increased nearly a half million dollars over the exports during the same month of the preceding year, the total value of these products exported in the later May was $4,227,309 and in May of 1912 it was $3,752,734, an advance of $474,575, or 10.6 per cent.

While details as to the destinations of the various items are not given in the preliminary report just issued by the Federal statisticians, the exports of cars alone showed in total $192,371; the shipments in May, 1913, were 3,036 cars valued at $3,-[illegible]189 and in May, 1912, 3,009 cars with a valuation of $2,963,818. The gain in number was 27. Of the 3,036 cars shipped in the latter month 141 were trucks and 2,895 pleasure vehicles.

Parts, not including engines and tires, exported in May, 1912, were valued at $448,-[illegible]72 and in May, 1913, $537,511, an increase of $88,539; this brings the total of cars and parts to $3,412,790 for May, 1912, and to $3,692,700, a gain of $279,910. Also, for a period of 11 months ending with May, 1913, the value of cars and parts exported was $25,512,[illegible]83, and for 11 months ending with May of the previous year, $23,179,285, an increase of $5,333,480. For these same periods the number of cars shipped was [illegible]932 and 19,816, an increase of 3,316.

During May of 1912 the value of the tires sold in foreign countries was $272,-[illegible]77 and in May of 1913 $396,816, an advance of $124,409. Engines also showed an increase; in May, 1912, there were exported 72 valued at $67,627, and in May, 1913, 978 valued at $137,795, a gain of 407 in number and $70,168 in value.

Imports of cars continued to decrease; May of 1912 showed imports of 76 cars valued at $165,759, while in the following May, that of 1913, the figures had dropped to 42 cars valued at $113,737, losses of 34 in number and $52,022 in value. Parts acted in a contrary manner, however, gaining $5,-[illegible]43, the figures for May, 1912, and May, 1913, being respectively $21,493 and $26,-[illegible]36.

More Engines Coming from Indianapolis.

The Smelser Engine & Machine Works, which was incorporated several months since under Indiana laws with an authorized capital of $50,000, has acquired a four-acre site in the Mars Hill district of Indianapolis on which it will at once erect a brick and concrete building for the manufacture of gasolene engines and appliances, including transmissions. Most of the devices are the invention of James M. Smelser, vice-president of the company. Its other officers are: E. G. Ritchie, vice-president; Guy M. Churchill, secretary; Noble H. Whible, treasurer. These officials with D. M. Parry, T. C. Rees and H. A. Debaut comprise the board of directors.

No Ford Prices Until October Next.

Because of the appearance and promised appearance of many so-called cyclecars and small automobiles at less than Ford prices, there has been much speculation as to whether the Ford Motor Co. would not do something in that direction that would make the world "take notice." But as a matter of course the Ford people are not worrying, and inquiry at headquarters in Detroit brought the response that Ford prices are not settled until October and that there is not likely to be any deviation from the rule this year, if, indeed, there will be any change of price.

Cameron Acquires Factory in Connecticut.

The reorganized Cameron Mfg. Co., of Beverley, Mass., has finally acquired a plant in West Haven, Conn., and intends to resume the manufacture of Cameron cars in that city on or about August 1. It is stated that incidental to its removal the company's capital will be increased to $1,000,000 and the residents of New Haven be given an opportunity to purchase thereof.

Stearns Sails for European Vacation.

Frank B. Stearns, president of the F. B. Stearns Co., of Cleveland, sailed Tuesday last, 1st inst., on the Rotterdam for a midsummer vacation. Mrs. Stearns accompanied him. Before sailing, Mr. Stearns let fall that, despite some rumors to the contrary, prices of the Stearns-Knight cars will remain unchanged.

Poultry Hatchers to Produce Trucks.

After two years of experimentation, the Cycle Hatcher Co., of Elmira, N. Y., which manufactures incubators and the like, is making ready to place on the market a motor truck; it will employ a four-cylinder 4½ x 5 block motor giving 40 to 50 horsepower at 1,200 revolutions.

Lozier Opens Office in Detroit.

H. A. Lozier, as president of the Motor Patents Co., has opened an office in the Dime Savings Bank Building in Detroit. He will, however, retain his interests in the Lozier Motor Co.

ANY STAMPS NOW USABLE ON ANY KIND OF MAIL MATTER

Regular Stamps Good on Parcel Post and Parcel Post Stamps Good on Other Mail—C. O. D. Regulations and Other Rules.

Any postage stamp is now good on parcel post packages, and parcel post stamps are good on all classes of mail, according to an order of Postmaster General Burleson which went into effect Tuesday of this week, July 1; heretofore ordinary stamps have not been good on parcel post packages and parcel post stamps have not been good on letters. The new arrangement will render a convenience to those using the service in that any postage at hand will be usable on any class of mail matter.

There also went into effect July 1, as was stated in the Motor World would be the case, the collect-on-delivery rule, whereby goods may be sent and their price collected and remitted to the sender by the post office of delivery. There are, however, certain regulations to be observed under Section 66 of the parcel post regulations.

The sender of a mailable parcel on which the postage is fully prepaid may have the price of the article and the charges thereon collected from the addressee on payment of a fee of 10 cents in stamps affixed, provided the amount collected does not exceed $100. Such a parcel will be insured against loss, without additional charge, in an amount equivalent to its value, but not to exceed $50. The sender of a collect-on-delivery parcel will receive a recipt showing the office and date of the mailing, the number of the parcel, and the amount due him.

C. O. D. parcels will be accepted for mailing only at a money order post office and when addressed to a money order post office. If a C. O. D. parcel is received at a non-money order post office the postmaster will notify the office of mailing of the amount of postage required for its return. The postmaster at the office of mailing will ascertain from the sender whether he desires the parcel returned or delivered without collection of the charges. If the sender notifies him in writing that the parcel may be delivered without collecting the charges, he will attach the order to the office coupon and notify the postmaster at the office of address to that effect.

A C. O. D. parcel will be treated as ordinary mail matter until it reaches the office of address, where, on payment of charges, it will be delivered to the addressee, or, unless otherwise directed by the addressee, to the person, firm, or the corporation

Digitized by Google

in whose care it is addressed, or to any responsible person to whom the addressee's mail is ordinarily delivered.

The addressee will not be permitted to examine the contents of a C. O. D. parcel until it has been receipted for and all charges paid. A parcel may be refused when it is tendered for delivery, but after delivery has been effected it cannot be returned on account of dissatisfaction with the contents or the amount collected. The Post Office Department will not be responsible for errors made by senders in stating the collection charges or for any misunderstanding between the senders and addressees regarding the character of the contents of parcels.

The cumbersome and inconvenient parcel post stamp regulations were adopted to give the government a line on the volume of matter carried by the new department, and now that this information has shown the popularity of the parcel post the stamps will be discontinued, it is stated, when the present supply is exhausted, which time is not distant.

Shepherd-Oakland Must Stay in Court.

The United States District Court for the Southern District of New York this week denied the application of Irving R. Shepherd to have remanded to the Supreme Court for New York county his action against the Oakland Motor Car Co., of Pontiac, Mich., in which he asks $15,000 for damages for injuries sustained when the flywheel of an Oakland car burst during the time when he and his brother were Oakland representatives in the metropolis. Shepherd's suit was instituted in the Supreme Court, but was removed to the United States court at the request of the Oakland company.

Cash Payment Proved to be not Cash.

Because a check for $500 which the Motor Trading Co., of 206 West 76th street, New York City, gave to the G. P. Warner Coal & Supply Co. as the first payment on a used truck went to protest the coal company this week secured a judgment for $538.91; the complainant states that the Motor Trading Co. was to pay $2,300 for the truck, $500 down and $1,800 in three installments. The trading company, which deals in used cars; formerly was located at 254 West 50th street, but recently moved to its present location.

"Owners' Association" Owes for 'Phone.

Judgment for $22.26 was filed this week in the New York county clerk's office by the New York Telephone Co. against the Automobile Owners' Association; the latter has an office at 27 William street, New York City.

POISONING EUROPEAN MIND AGAINST THE AMERICAN CAR

More About the Contemptible Campaign Being Waged in Germany—Anti-American Printed Matter Regularly Circulated.

"At least some of the European manufacturers of motor cars are spending more valuable time in trying to belittle American-made automobiles than in improving their own production facilities to meet the so-called invasion in the logical way," is the declaration made by Kurt Isserstedt, distributer of Overland automobiles for the German empire, in amplification of his views on the subject expressed in last week's Motor World. "Not only are they wasting their time in these efforts, but, I am sorry to say, they are playing the game unfairly. It is this underhand competition which has made it so difficult for the really meritorious American car to gain a foothold on the continent, though, judging from the success with which the Overland has met in Germany during the past year, better times are coming.

"One of the most difficult features of the European opposition with which we American representatives in Germany have to contend is the regular issuance of false statements by Continental motor car manufacturers concerning our cars. Once a month, or oftener, every motor car dealer and owner in the German Empire receives, through the mail, a printed circular which is devoted entirely to criticism of the American-made automobiles. To a great extent these criticisms are not only unfair, but intentionally and deliberately untrue. Americans cannot realize to what lengths European competitors will go in order to create a distrust of American cars.

"I have in mind a particularly vicious attack, all the more unjust because there was absolutely no foundation of truth for it. It was an illustration in one of the printed circulars, showing a man bending a motor crankshaft almost double, across his knee, with apparently but little effort. While it was not so labeled, the reading matter accompanying led the unthinking reader to the belief that the illustration was made from an actual occurrence, that the crankshaft was taken from a medium-priced American car and was found so poor in quality and construction that a man of ordinary strength actually bent it across his knee.

"Of course, to the person who knows anything at all of metals or motor cars, the illustration was ridiculous, for the poorest crankshaft ever made could not be so handled. But on the European who, perhaps, already has a deep-seated prejudice against all things American, this 'knock,' as you call it here, makes a far deeper impression in Europe than one can believe would be possible.

"And this case is only one of hundreds of like attempts made to belittle the American-made car. Even though some are so plainly impossible as to be absurd, they will have their evil effect."

Weed Enjoins a Gripwell Chain Seller.

James H. Simms, who used to sell supplies and accessories on New York's "Automobile Row," apparently isn't worrying over the outcome of a suit which the Weed Chain Tire Grip Co. filed against him over a year ago for alleged infringement of the Parsons patent, No. 723,299, in selling Gripwell grips; relying upon his lack of concern and the fact that he put in no defense, the Weed company this week in the United States District Court for the Southern District of New York secured a decree pro confesso, which means judgment by default. Simms's present whereabouts are unknown. The Gripwell tire chains were manufactured by the H. Channon Co., of Chicago, which the Weed company defeated in a suit which was carried to the United States Circuit Court of Appeals, decision having been rendered but a few months ago.

Body Builders Beat White Second Time.

Litigation which followed the sale of a town car body to the White Co., of Cleveland, Ohio, December 29, 1911, by the Manhattan Top & Body Co., of New York City, terminated this week in a verdict in favor of the body builders upon the second trial of the action in the New York City Court. The White Co. refused to pay for the body on the grounds that it was defective and set up a counterclaim of $1,430. The body builders claimed $850 for the body, $5.50 for labor and interest.

The first trial—about a year ago—resulted in a verdict of $871.25 for the body builders, but a new trial was secured. The verdict of this week was for $926.40, but the addition of costs brings the total of the judgment to $1,109.46.

Prest-O-Lite Sues Dealer in Wichita.

The Prest-O-Lite Co. has secured a preliminary injunction in the Federal court for the District of Kansas against Charles O. Hoover and Ernest Craig, proprietors of the Headlight Gas Co., of Wichita, also $5,000 is asked for refilling Prest-O-Lite tanks; it is charged that the defendants refilled and sold Prest-O-Lite tanks in violation of the Federal trade mark law forbidding such practice.

The Week's Incorporations

Raleigh, N. C.—Murchiso Garage & Machine Co., under North Carolina laws; to sell, handle and repair motor cars, etc.

Greensburg, Pa.—Greensburg Transportation Co., under Pennsylvania laws; authorized capital, $10,000; to operate a motor passenger line.

Columbus, O.—Columbus Electric Vehicle Co., under Ohio laws; authorized capital, $50,000. Corporators—O. H. Perry, D. N. Perry, W. G. Neff.

Toledo, Ohio—Engel Auto Parts & Motor Mfg. Co., under Ohio laws; authorized capital, $75,000. Corporators—W. P. Engel, F. T. Betts, Samuel N. Rapp.

Waterloo, S. C.—Colleton Automobile Repair Co., under South Carolina laws; authorized capital, $1,000. Corporators—H. E. Savage and M. O. Dunning.

Wilmington, Del.—Easy Starter & Speeder Co., under Delaware laws; authorized capital, $50,000. Corporators—H. E. Latter, W. J. Maloney, O. J. Richard.

Louisville, Ky.—W. P. Smith Auto Repair Co., under Kentucky laws; authorized capital, $10,000. Corporators—W. P. Smith, W. R. Schmidt, G. H. Schmidt, Phil A. Beck.

Bremen, O.—Bremen Garage Co., under Ohio laws; authorized capital, $10,000; to conduct a garage. Corporators—Albert E. Godfrey, Edward A. Hufford, Arthur D. Hufford.

Indianapolis, Ind.—Auto Drive & Parts Co., under Indiana laws; authorized capital, $100,000; to manufacture motor accessories. Corporators—J. J. Kennedy, J. J. Kelly, L. D. Beutin.

Mt. Vernon, N. Y.—Jaeger Rotary Valve Motor Co., under New York laws; authorized capital, $40,000. Corporators—Max Jaeger, Jacob Norden, William Cronenberg, all of Mount Vernon.

Glassport, Pa.—Pleasure Auto Safety-Disk Co., under Pennsylvania laws; authorized capital, $150,000. Corporators—M. M. Edmundson, T. M. Gealey, Clairton; H. L. Norwood, Pittsburgh.

Brooklyn, N. Y.—D. & R. Storage Battery Co., under New York laws; authorized capital, $100,000. Corporators—Adolph F. Lucker, Joseph E. Reid, Rudolph Drambourgh, all of 969 Kent avenue.

Chicago, Ill.—Gray Pneumatic Gear Shift Co., under Illinois laws; authorized capital, $1,000,000; to manufacture and deal in motor cars, etc. Corporators—Forrest E. Marsh, O. C. Cleave, Edward H. Gray.

Nashville, Tenn.—Williams Automobile Transmission Co., under Tennessee laws; authorized capital, $100,000. Corporators—Benjamin S. Williams, James S. Frazer, Thomas L. Herbert, P. H. Cain, H. H. Campbell.

Indianopilis, Ind.—Merchants' Garage, under Indiana laws; authorized capital, $15,000; to conduct a garage. Corporators—C. S. Shotwell, M. J. McGarr, H. H. Rice, W. A. Atkins, B. D. Christian, C. W. Dicks, C. B. Marshall.

New York, N. Y.—Anthony Auto Repair Co., under New York laws; authorized capital, $10,000. Corporators—Julia Yandrastich, 607 East 83rd street; Florence M. Struckhausen and Henry Struckhausen, both of 452 East 84th street.

New York, N. Y.—Turin Garage & Supply Co., under New York laws; authorized capital, $5,000. Corporators—John F. O'Neil, 503 West 169th street; Frank H. Coyne, 100 North Broadway, Yonkers; Anna Grabsheid, 131 West 142d street.

New York, N. Y.—Demos Auto Repair & Garage Co., under New York laws; authorized capital, $3,000. Corporators—Demos Tsaconas, 618 West 187th street; Gustave A. Gsell, 137 Fifth street, Union Hill, N. J.; James E. Bradley, 210 West 43rd street.

Beaver, Pa.—Economy Electric Co., under Pennsylvania laws; authorized capital, $60,000; to succeed Economy Mfg. Co. and manufacture magnetos, generators and electric lighting equipment for motor cars, etc. Corporators—D. A. Anderson, Sewickley, and others.

New York, N. Y.—Findeisen & Kropf Mfg. Co., under New York laws; authorized capital, $5,000; to manufacture motor cars, aeroplanes, etc. Corporators—F. Findeisen, Berwyn, Ill.; O. F. Kropf, Stratford Place, Chicago, Ill.; Charles A. Riegelman, Woodmere, N. Y.

New York, N. Y.—Dayton Touring Car Co., under New York laws; authorized capital, $2,000; to conduct a motor car business. Corporators — Thomas Luby, 1302 Stebbins avenue; Herbert L. Lindsay, 1219 Wheeler avenue; Frank Cunningham, 141 West 96th street.

How Erwin Would Kill Garage Fires.

J. B. Erwin of Milwaukee, a well-known inventor, has developed a new system of fire protection for garages which, because of its simplicity is expected to make a strong appeal to garagemen. The system makes use of a cypress tank set 8 feet deep in the corner of the building and filled with bicarbonate of soda. A small receptacle filled with sulphuric acid is suspended in the tank so that the fusing of a network of wires in the building precipitates it into the soda, the resulting carbon dioxide or gaseous foam flooding the floors. A demonstration was given last week for the benefit of representatives of the Chicago Board of Fire Underwriters, and was most successful. While the principle is an old one, Erwin has carried it out ingeniously in an entirely new way.

Recent Losses by Fire.

Shreveport, La.—Hoffelfinger Bros., garage destroyed. Loss, $9,000.

Cortez, Fla.—I. C. Grable, garage and contents destroyed. Loss not stated.

Weehawken, N. J.—John Willardson, 80 Oak street, garage destroyed. Loss, $5,000.

Yonkers, N. Y.—J. E. Thompson, 455 North Broadway, garage destroyed. Loss, $4,000.

Fairfield, Iowa — Galither & Holcomb, North Court street, garage damaged. Loss not stated.

Philadelphia, Pa.—Samuel Hoebner, 318 West Highland avenue, garage destroyed. Loss, $12,000.

Changes of Capitalization.

Birmingham, Ala.—Robertson Tire & Auto Co., from $2,000 to $50,000.

Cleveland, O.—Bane-Subers Tire & Rubber Co., from $250,000 to $1,500,000.

Change of Corporate Name.

Norfolk, Va.—Auto Specialty Co. to Auto Puncture Proof Co.

Fort Worth, Tex.—Marrs-Lingo Motor Co. to Detroit Electric & Motor Car Co

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

C. M. Tichenor has been appointed sales engineer of Gray & Davis for the territory adjacent to Detroit, in which city he will have his headquarters. Tichenor is one of the veterans of the industry.

Norman H. Halliday has been appointed manager of the International Motor Co.'s New England branch in Boston. Previously he was connected in turn with the Thomas and Packard companies.

L. A. Austin has resigned the general management of the Mais Motor Trusk Co., of Indianapolis. He has no definite plans in mind other than a good rest at his home in Detroit, to which he has removed.

George H. Bryant, advertising manager of the Locomobile Co. of America, has resigned that position to become identified with the Velie Motor Vehicle Co., of Moline, Ill. He will be attached to the advertising department.

Frank E. Chapman, for the last eight years superintendent of the service and repair department of the Maxwell-Newcastle Motor Co., of Newcastle, Ind., has resigned. He will be succeeded by E. A. Richmond, of Detroit, who previously was connected with the Flanders Motor Co.

E. M. Denton, formerly agent for the Chase Motor Truck Co. in Baltimore, Md., has been appointed district manager in place of C. K. Thomas, resigned. For the present he will make St. Louis his headquarters. His territory will comprise the greater part of the Southwest.

W. B. Fewell, successively manager of the Olds branches in St. Louis and Boston, has been promoted to the management of the Oakland Motor Car Co.'s branch in New York. He succeeds George S. Waite, who resigned to join a cyclecar manufacturing enterprise in which he has acquired an interest.

John Guy Monihan, advertising manager of the Premier Motor Mfg. Co., of Indianapolis, has resigned that office to become the assistant director of sales and advertising of the Cole Motor Car Co., of both of which departments Homer McKee is the head. Simultaneously Ed. F. Harris has been promoted to the post of field sales manager of the Cole company.

Horace C. Mills has been appointed manager of the Detroit branch of the Electric Auto Light Co., of Toledo; the branch is located in the Boyer Building in the "automobile capital." Mills has been identified with the automobile ignition business for some 15 years, latterly serving as special representative of the Westinghouse starting, lighting and ignition division.

J. F. Gfrorer has been promoted to the management of the Alco general service department of the American Locomotive Co., with which department he has been connected since its inception. Incidentally, the Alco officials have merged the general service department with the service and branch houses and the dealers' service department, thereby concentrating the work.

Minor Business Troubles.

Elmer E. Woods, of Santa Barbara, Cal., has filed a petition in bankruptcy. He traded as the Auto Tire & Vulcanizing Co.

Louis Zeisler, trading in New York City at 1777 Broadway, as the Excelsior Tire Co., has filed schedules in bankruptcy. His liabilities are $,854 and his assets $2,223.

Cyrus K. Fauver has been appointed receiver for the Militaire Auto Co., of Cleveland, Ohio. Its liabilities are between $15,000 and $20,000, while the assets are considerably less. Despite its title, the company manufactured not cars but motorcycles of radical design.

The United Motor Chicago Co., successor to the old Maxwell-Briscoe Chicago Co. and located at 1735 South Michigan avenue, has filed a petition in bankruptcy. The stockholders at a meeting held June 14 decided that insolvency could not be averted. The assets are $27,175 and the liabilities $106,140.54. W. M. Anthony is president. Accounts receivable constitute nearly the entire assets and the largest debt is $80,258, owed to the old United States Motor Co., of 1790 Broadway, New York City. Other debts are: Maxwell Motor Car Co., of New York, $9,385; National Motor Co., New York, $6,594; Sarah J. Howard estate, Chicago, $5,168.

Fred C. Robie, who was a director of the Excelsior Supply Co., of Chicago, which failed in December, 1911, has filed a petition in bankruptcy as an outgrowth of that transaction. The company's assets paid 47½ per cent. on the dollar, and Robie gave his note for the balance, which makes up the greater portion of his liabilities of $591,805. He schedules his assets at $25,672, which includes his residence at 5757 Woodlawn avenue, on which the Union Trust Co. holds a $25,000 mortgage; his largest creditor is the Corn Exchange National Bank, $90,300. The business of the defunct concern is carried on now at 2200 South Union street under the name Excelsior Motor Mfg. & Supply Co.

WORM DRIVE ADOPTED FOR RAUCH & LANG ELECTRICS

Two Models Have It at Present and All Will Have It Eventually—High Speed Motor Is Retained.

Having demonstrated to its own satisfaction during several years of continual testing that worm gear drive for electric vehicles has certain advantages not possessed by any other method of final drive the Rauch & Lang Carriage Co., of Cleveland, Ohio, has formally adopted worm drive for two of its models which just have been placed on the market; eventually, it is understood, all models will be equipped with worm drive, though for the present the reduction by silent chain and bevel gears will be retained. The worm drive is used on coach model J-4 and brougham model B-4, the former being a five-passenger car in which all passengers face forward, and listing at $3,100 with front drive, and the latter being a four-passenger car with rear lever control, listing at $2,950.

In adopting worm drive for these two models, it has not been found necessary to make any change in the motor except as regards its method of mounting; it remains the same high-speed Rauch & Lang-Hertner motor that always has been used. Under the new arrangement, the propeller shaft is connected directly to the end of the armature shaft through a universal joint; a second universal join on the forward end of the worm shaft permits perfect flexibility. To permit of a straight line drive with the normal complement of passengers, the rear of the motor is tilted slightly upward and the axle correspondingly. The particular advantages of the worm drive are that it decreases noise, permits a smoother drive and the use of a high speed, light motor without the necessity of chain reduction, reduces friction and increases the mileage per charge.

The price of the worm-driven brougham —$2,950—is $50 higher than the price of the corresponding bevel driven car; the price of the coach is the same as that for the corresponding bevel driven car.

Keeton Car to Invade Argentina.

Wm. H. Knox & Co., of Buenos Aires, Argentina, have been appointed agents for the Keeton car in that South American republic. Their first shipment comprised three Keeton cars—two blues and one green. Knox & Co. maintain an office in New York City, but the Keeton agency was secured as the result of a recent visit by Knox to the Keeton factory in Detroit.

In the RETAIL WORLD

O. E. Bickford plans to build a new garage in Fitchburg, Mass.

E. L. Harbert plans to erect a garage and repair-shop in Altoona, Pa.

P. C. Rodman, of Abilene, Kan., has opened a garage. It is located on 4th street.

M. L. Miller purposes to build a garage in Freeport, Ill. The location is on Exchange street.

The DuBois (Pa.) Garage Co. purposes to build a new garage; it will stand on South Brady street.

Rohlfing & Son, of Elysian, Minn., have sold a half interest in their repair-shop to C. J. Whitten.

The Pioneer Motor Car Co., of Marietta, Ohio, will build a new garage; the location is on Front street.

The Glenwood Garage is the style of a new enterprise in that California town; it is located on Market street.

The India Rubber Tire Co. has opened up in Chicago at 1510 Michigan avenue; Marathon tires are stocked.

H. A. Simmons is about to erect a two-story garage in Dallas, Tex., at 334 West 12th street; it will cost $9,000.

The Pierce County Auto Co., of Puyallup, Wash., has opened a new garage. It is located on Stewart street.

Thomas Shaw, of Wichita, Kan., has opened a garage on South Market street. He will handle Marathon cars.

James Bex, of Syracuse, N. Y., has taken over the garage at 628 Montgomery street, formerly operated by T. F. Willis.

I. A. Vansickle, of Toronto, Ont., will build a two-story concrete garage at 254 Dupont street. It will cost $30,000.

Henry A. Bradley, of Salt Lake City, has secured a site on 7th South street and will erect a garage. It will cost $40,000.

T. D. Kemp has purchased the Auto Supply Co., in Wharton, Tex. Previously it was owned by George Carpenter.

Kates Bros. have opened a garage in Bridgeton, N. J., at Pearl and Warren streets; they have the Regal agency.

William P. Cooper, of Fort Wayne, Ind., has secured permission to build a garage. The site he has selected is on Wayne street.

John A. Jamison, of Wheeling, W. Va., is about to build a garage on Loretta avenue. He will make a specialty of storage.

James E. Brennan, of 25 Library street, Danbury, Conn., has taken over the Green Garage; John W. Green was the proprietor.

Matthew Mackenhausen, Jr., of White Bear, Minn., has opened a new garage and repair-shop; it is located on Banning avenue.

William H. Coolidge has secured plans for a garage to be erected in Gloucester, Mass. The site selected is on Magnolia road.

Carson & Co., of DuBois, Pa., are arranging to erect a new garage and livery building; it will stand on the site of their present structure.

Henry D. Lovering, of Greenwood, Mass., is about to open a garage and repair-shop; he will remodel the Tupper blacksmith shop for the purpose.

Beverly and Reginald Grigsby have completed a new garage, 74 x 50 feet, in Bardstown, Ky. It is located on Arch street between 3d and 4th streets.

T. L. Matthay and Harry Benham, formerly of Chicago, are about to enter the trade in Los Angeles, Cal. They will open a garage on South Main street.

Charles Beblert, of Brooklyn, N. Y., has secured permission to build a garage at 161 Prospect Park West. The application states that the cost will be $3,000.

H. M. Quail, of Dayton, Ohio, has become a dealer; he has the Patterson agency for several counties about Dayton, and is seeking a location for salesrooms.

J. L. Warnock and H. G. Gasner have formed a partnership in San Bernardino, Cal., under the style Warnock & Gasner Co.; they will handle Haynes cars.

Oscar Pollack has entered the list of dealers in Fremont, Neb. He has taken the Hupmobile agency and has secured show space in the Gray Bonnet Garage.

The Star Motor Co., of Chicago, has had plans prepared for a one-story garage, 200 x 200 feet, to be erected at 22nd street and South Park avenue. The estimated cost is $50,000.

The Union Motor Co., of Davenport, Ia., has erected a new garage and salesrooms on Western avenue. The company handles Buick and Oldsmobile cars. Louis Otto is president.

The Auto Tire Sales Co. has opened up in San Francisco, Cal., at 1934 Van Ness avenue; a tire filler is to be exploited. The company is headed by Barney Oldfield, the racing driver.

E. Westerman, formerly of Carlisle, Ill., has purchased the Ford agency in Tulsa, Okla., from W. S. Hall, and will operate it; the salesrooms are located at 215 East Second street.

F. E. Smith has sold his interest in the Letts Auto Co., of Letts, Iowa, to S. B. Furnas; the company deals in cars and accessories and operates a repairing and vulcanizing plant.

N. R. Herrick & Co., of Tampa, Fla., motor boat repairers, are about to build a garage; they have leased a site on Bay street, near Gottsche avenue. Accessories and supplies will be stocked.

The W. S. Williams Auto Sales Co. has been formed in Oshkosh, Wis., by W. S. Williams. He has leased space in the Northwestern block and will operate a garage and handle two lines of cars.

Selley Bros., of Albany, N. Y., plan to erect a three-story concrete garage; the site is at Broadway and Ferry street. It is stated that the establishment will be one of the largest in Albany and vicinity.

Henry A. Bradley is about to erect a garage in Salt Lake City on State street, south of Seventh street; the site cost $10,000, and $40,000 will be expended in the construction of the garage. The site frontage is 60½ feet.

James W. Corrigan, who has conducted a garage in Pontiac, Ill., for several years, has removed his business from the Renoe Building, on North Mill street, to a new garage building; it is located on West Madison street, opposite the Alton station.

E. E. Hewlett, chief backer of the "outlaw" racing association in Los Angeles, where he has been a Fiat dealer, has arranged to represent this line of cars in the Chicago, Seattle, San Francisco and Tacoma, Wash., districts. He has specified Ajax tires as equipment on the cars he handles.

The Chanslor & Lyon Co., accessory and supply dealers in San Francisco, have taken possession of a new four-story building at

Digitized by Google

Van Ness and Suttler avenues; the building affords 25,000 square feet of floor space and has a sound-proof room for stenographers and the clerical force, and a "cosy corner" for customers.

The Utica (N. Y.) Motor Car Co., of 337 Bleecker street, has opened a used car department; the new establishment is housed in the Weaver Building, at 52 Jay street, which has been remodeled for this purpose. Weekly used car bulletins to prospects are to be a feature of the business, which will be operated separately from the new car sales work.

The Moon Machine Co. has been incorporated in Muncie, Ind., with $50,000 capital by W. H. Moon, C. R. Moon, O. P. Perkins, Clyde E. Whitehall and Herbert R. Bard. The new corporation takes over the Moon Bros. Co., which has been operating a machine-shop at Hackley street and the Chesapeake & Ohio Railroad and, in addition, will build an automobile engine.

A second automobile clearing house, under the style Auto Sales Co., is about to be established in Indianapolis by Joseph H. Hawkins, who has been engaged in the trade since 1906, for much of the time with the Nordyke & Marmon Co. Hawkins was secretary and treasurer of the first clearing house venture, the Auto Clearing House, which recently removed from West Wabash avenue to North Illinois stret; the new business will utilize the West Wabash avenue location of the first clearing house.

Albert W. Woodruff, as Albert W. Woodruff, Inc., has opened up in Boston as New England distributer of Lozier cars. E. R. Hunnewell, temporary manager of the Lozier business at Commonwealth avenue and Bacon street, is associated with him and the old location is retained. Woodruff has been engaged in the trade for six years and has been connected with the Marathon, Stearns and Peerless companies. Before going to Boston he was manager of the Cleveland (Ohio) Lozier Sales Co. The vacancy in the latter has been filled by the appointment of A. C. Weaver.

William H. McLean, of the Auto Supply Co., and C. L. Brack, of the Southern Auto and Electric Co., both of Little Rock, Ark., have effected a combination of their businesses, under the style the Southern Auto Supply Co. The entire stock of the Auto Supply Co., hitherto located at 113 East Fourth street, has been removed to the Southern Company's location at 405 West Capitol avenue, where the business will be conducted. The combination followed the withdrawal or E. O. Brack from the Southern company; he will continue to conduct the Hudson and Hupmobile agencies and a garage and repair-shop at 405 West Capitol avenue.

"SPITE WALL" DARKENS 24 SYRACUSE GARAGE WINDOWS

Real Estate Squabble Causes Brick Barricade Close to and on Two Sides of Garage—Pretty Question of Lease Involved.

What good are garage windows if you can't see through them? This is a question which is worrying Edward P. Young, a dealer in Syracuse, N. Y., for although a garage which was erected for him has many and spacious windows, 24 of them have been rendered useless by an excellent specimen of "spite wall" which an adjoining property owner has erected within three or four inches of Young's establishment and on two sides of the building.

The garage was built for Young by Wm. Keck, who owns the site, at 212 Jackson street, and stands within about three feet of a wooden building at 214 Jackson street, owned and used by Peter Buettner for the storage of machinery. Just how these little real estate and "spite wall" wrangles start often is not clearly understood, but Buettner claims that employes in Young's establishment annoyed him by throwing dirty waste out of the windows and onto his property, which runs right up to the garage wall.

Buettner claims the Board of Health, upon complaint of Keck, told him he was unsanitary and would have to clean up, and he maintains that so long as the garage windows afforded a convenient exit for used waste he could not keep his premises clean. He also maintains that he contemplated erecting a two-story brick storage building on his lot, anyway, and that as the matter now stands, he merely has been obliged to start construction a little earlier than he anticipated. As it is, the wall extends 70 feet back from Jackson street and about 33 feet across the rear end, and if it comes up to specifications it will, when fully completed, be of the same height as the garage. The darkened windows are 12 on the side and 12 on the back.

The wall, according to Young, renders his garage useless without the installation of artificial light and he claims his lease is automatically nullified. Keck appears to be the man who should worry, for he owns the garage. Young can move.

Advertisers Attach Abbott Dealer.

An action upon notes given by the Abbott-Detroit Motor Co., the former Abbott-Detroit dealer in New York City, resulted in an attachment being granted this week in the Supreme Court for New York County in favor of the Van Cleve Co., a New York advertising agency, for $1,002.87. The notes were given in conection with the company's advertising, and the attachment is also directed against Julius G. Hocke, the treasurer of the company, who endorsed the paper. The Abbott agency and the parent company in Detroit recently severed relations.

Burying the Remains of the Brush.

The Brush Detroit Motor. Co. and the Brush Chicago Motor Co. have filed a petition for dissolution, and the court has given the minority stockholders until September 25 to show cause why the affairs of the two companies should not be wound up. Both were formed as distributing agencies for the United States Motor, but as the Brush car has been discontinued, no reason remains for the Brush agencies' existence, legal or otherwise.

Want Victor Truck Declared Bankrupt.

The Victor Motor Truck Co., of Buffalo, N. Y., has been petitioned into bankruptcy by three creditors whose claims aggregate less than $1,600. They allege that an act of bankruptcy was committed in April last when the company made a general assignment its its assets to one Marc W. Comstock.

Another Building for Diamond Chain.

The Diamond Chain & Mfg. Co., of Indianapolis, has bought what is known as the Holliday & Wyon building at Ohio and West streets in that city, and will utilize it as an annex to its plant on South Senate avenue. The building acquired is a three-story brick and concrete structure, 66 x 145 feet.

Garage, Being Enlarged, Collapses.

While a second story was being erected over the Euclid Square Garage in Cleveland, Ohio, Saturday last, 28th ult., the false work collapsed, burying 30 men and injuring many of them severely. The building, the largest of its kind in the city, was wrecked.

Benson to Build Tractors on Coast.

The W. J. Benson Co., of San Jose, Cal., has purchased all patents and other rights to the Calkins & Johnson tractor, which it proposes to manufacture in San Jose. Benson himself was in Detroit last week purchasing material for the purpose.

Studebaker Retires 4,450 Preferred.

The Studebaker Corporation has notified the Chicago Stock Exchange of the retirement of 4,450 shares of preferred capital stock. This procedure complies with provisions of organization, leaving outstanding $12,650,000.

"POISONING" THE GERMAN MIND.

It may be true that "all is fair in love and war" but in the more enlightened parts of the world, at least, it is a generally accepted theory that in business certain ethics, or principles, or decencies should be observed.

Although Germany is generally considered an enlightened community, the tactics which prevail in the German automobile industry suggest that such theories or such principles have not found lodgment in that part of the empire. Certainly the spirit of fair competition has been so badly twisted that it cannot recognize itself.

As was the case when the American bicycle was uppermost, the American automobile is now the target for almost unbelievable misrepresentation and vilification, which in many instances is vicious, if it is not vile. In the heyday of the bicycle, the Germans not only bodily pirated designs of American bicycles, but boldly reproduced American accessories on an enormous scale, and, though this may not have been wholly unfair, while such tactics were in progress boycotts of papers that printed advertisements of American bicycles were instituted and a wholesale campaign of vilification and misrepresentation was conducted, in print and out of it, in order to poison the German mind against the American article. It is similar tactics that are now being employed to disparage the American motor car.

If Americans had employed like methods to beat back or "kill off" German goods, the German policy might be understood on the fight-fire-with-fire principle, but Americans have done nothing of the sort; they have not even employed the "Rally-'Round-the-Flag-Boys" cry which is intermittently popular in Great Britain. There is, therefore, no valid excuse for the German tactics.

Apparently the mud-slingers have not yet succeeded in poisoning all of the German mind, but whether or no this result is finally attained their contemptible procedure cannot but reflect on the German sense of honor and business decency. It is a sorry commentary on any country when competition can be met only by foul means.

SEATS THAT PROMOTE DISCOMFORT.

In the unceasing effort to improve motor cars, and particularly to add to the comfort of their occupants, not enough attention has been given the "extra seats" with which six- and seven-passenger cars are equipped. The problem is not easy of solution but it is fairly clear that many such seats are little more than mere makeshifts designed to meet competition or to fill somehow a demand which undoubtedly exists. But anyone who ever has occupied such a makeshift seat for any length of time cannot fail to be physically impressed by its discomfort.

Too many of them are lacking in proper cushioning, others have insufficient support for the back, while still others permit no up-or-down adjustment. In a few instances, all of these faults are lacking in particular cars. They merit attention and correction, for the discomfort for which they are responsible is very real and very earnest, so to speak. Apparently some of these "extra seats" were designed with a view that they would be occupied only by children or dwarfs, for in no other way is it possible to account for their size, their paucity of cushioning and their low positioning. Their designers ought to be compelled to occupy them for an hour or two; it would be punishment befitting the "crime."

WILL SIDE LAMPS BE ELIMINATED?

Of all unlooked for developments, none has been so wholly unforeshadowed as the sudden and pronounced trend towards the elimination of side lamps, and even the inset dash lamps, which latter only came into fairly general use within a twelvemonth. There is no mistaking the tendency, however, toward the use of what may be termed double-purpose head lamps; that is, head lamps in which are fixed a separate and smaller bulb which will serve the purposes heretofore rendered by side lamps; when this is not to be the case, automatic devices which will dim the penetrating and dazzling headlight itself apparently will be utilized.

Perhaps it is too much to say that side lamps will be entirely eliminated but it is not to be doubted that the present trend makes for both simplicity and economy, and that it is one of those numerous ingenuities in the wonder-is-it-was-not-thought-of-long-ago category. Making one lamp serve the purpose of two is almost akin to making grow two blades of grass where but one grew before.

DOWNPOUR MARS START OF INDIANA TO PACIFIC TOUR

Sixteen Cars and Two Trucks Get Away in Rain Storm That Fails to Dampen Enthusiasm—Much Entertainment Scheduled.

With something more than 3,500 miles between them and their destination, and in pouring rain, 18 cars, including two trucks, rolled away from the starting point in Indianapolis under the guiding hands of as many members of the Indiana Automobile Manufacturers' Association on the first leg of their "boosting" journey to the Pacific Coast, thus marking the beginning of what is the most pretentious of all organized automobile tours—a tour that has virtually grown out of last year's Premier coast-to-coast run and that has back of it the experience gained in last year's Four States tour of the Indiana manufacturers. To-night (Thursday) the tourists rest in St. Louis, Mo., after having covered some 340 miles of their trip, and to-morrow they will pass on to Columbia and thence through five States until they reach Los Angeles, where they are due to arrive, according to schedule, on August 2d, just 32 days later, though only 26 of them will be spent actually on the road.

Chairman H. McK. White has the tourists under his wing, so to speak, the complete list of starters being as follows:

D. S. Menasco, two Americans; R. P. Henderson, two Hendersons; W. McK. White, two Marions; John B. Orman, Premier; R. C. Crawford, two Haynes; Bruce Daniels, Pathfinder; J. M. Ward, Premier commercial; Arthur Dixon, McFarlan; Elmer Apperson, two Appersons; H. Hyde, Empire; G. Fred Smith, Pilot; J. Holloway, Brown commercial; C. G. Fisher, Marmon. One Stutz and one Premier were withdrawn at the last minute.

The route that has been laid down for the tourists has been chosen for a threefold reason: Because of its scenic beauty; because of the possibility of "boosting" Indiana products in the towns and cities through which it will pass; and because it has been judged that a goodly portion of the proposed Lincoln transcontinental rock highway from coast to coast will lie within its confines.

The longest day's run—that between Green River, Utah, and Salt Lake City—is 203 miles, and the shortest—between Salt Lake City and Ogden—is 37 miles; the average daily mileage, computed from the following itinerary, is 126 and a fraction. The finally approved itinerary, with the night stops and mileages, is as follows:

July	City.	Miles.
1	Terre Haute, Ind.	71.7
2	Springfield, Ills.	150.0
3	St. Louis, Mo.	117.7
4	Columbia, Mo.	130.0
5	Kansas City, Mo.	158.9
6	In Kansas City.	
7	Fort Riley, Kan.	156.6
8	Ellis Kan.	177.8
9	Burlington, Colo.	169.8
10	Colorado Springs, Colo.	165.9
11	Denver, Colo.	69.2
12	In Denver.	
13	Hot Sulphur Springs, Colo.	89.8
14	Glenwood Springs, Colo.	104.2
15	Grand Junction, Colo.	104.5
16	Green River, Utah.	154.0
17	Salt Lake City, Utah	203.2
18	In Salt Lake City.	
19	Ogden Utah	37.2
20	Kearney's Ranch, Utah	146.8
21	Ely, Nev.	124.3
22	Austin, Nev.	147.3
23	Reno, Nev.	183.5
24	Lake Tahoe, Cal.	72.0
25	Sacramento, Cal.	143.0
26	Oakland, Cal.	130.7
27	San Francisco, Cal.	6.0
28	In San Francisco.	
29	In San Francisco.	
30	Del Monte, Cal.	150.0
31	San Luis Obispo, Cal.	149.9
Aug.		
1	Santa Barbara, Cal.	119.6
2	Los Angeles, Cal.	105.8
	Total	3,539.4

It is a pretty fair guess that long before those who ride in the cars reach their destination, they will have had enough and plenty of touring—and of receptions and banquets and speeches and "boosting" and other things that have been planned for the entertainment of the tourists. In practically every city through which the tour will pass elaborate preparations have been made to entertain the tourists on a lavish scale, and in not a few cases reception committees will be headed by high municipal and State authorities. Governors Major of Missouri, Ammons of Colorado, Spry of Utah, and Odie of Nevada, for instance, will escort the party between the boundaries of their respective States, and Gov Johnston of California will journey eastward as far as Lake Tahoe, on the boundary of the State, to greet the tourists there.

Prior to the official start of the tour, which was made at two o'clock in the afternoon, all the cars, flag-bedecked and carrying their khaki-uniformed crews and guests, were lined up before the photographers, after which luncheon was served at the Hoosier Motor Club headquarters. Then, after a triumphal parade through the principal business streets of the city, preceded by formal presentation by Lieutenant Governor O'Neill of a large American flag and letters of introduction, the official starting gun was fired by Battery A of the Indiana militia ensconsed on the State House Plaza.

Arrived at Los Angeles, the tourists will remain four days to recuperate and to see the sights, the return date having been set for August 6th, when a special train will leave for the East.

BRITISH ENGINEERS DECRY CYCLECARS AND STARTERS

Two of Them, Well Versed, Rate Cyclecar Boom as a Bubble—Explain Lack of Demand for Starters.

To be British must be painful—to the pocketbook, at least—if it implies that studied indifference to natural progression which masks under the definition of conservatism and which so often serves as the British excuse for overlooking the advantages of something that some one else has developed just because it is more or less new, though not necessarily untried. And it is this British conservatism, with all its apparent drawbacks, that is held up as the real reason and the prime one for the marked absence of engine starting devices in a country to which American engineers at one time turned quite frankly for inspiration, if not for "styles."

Patriotism as a Bar to Progress.

As a plain indication of the "conservatism" with which the British automobile engineer in the abstract has adopted the engine starter which in America has been adopted by all save one manufacturer of note, it is only necessary to refer to the statistics of the last Olympia show, a show which tacitly represented the latest ideas of the British trade and reflected tendencies in the public demand. Among the 200-odd makes of cars that were shown an almost conspicuous 13 brands were fitted with engine-starting devices, and in a number of cases they were special equipment fitted at the demand of the purchaser and at his expense. Of these 13 brands, five had combined electric lighting and engine starting systems, of which three bore American trademarks; four had pneumatic starters, three had American spring starters, and one was fitted with an ignition starter. This to put it mildly, quite a contrast to conditions in America, where scarcely a single car is sold to-day minus some sort of an engine-starting device.

The typical Britisher is a patriotic sort of chap who not infrequently pushes his patriotism to the point where it blinds him to the strides that are being made by others; he wants and must have British-made goods; there is an insistent demand for home products that is well reflected in British advertising literature, which is liberally dotted with the all-satisfying phrase, "British made." And a good deal of the blame for the lack of demand for engine starters can be traced right back to this fact, for British engineers have as yet made no serious attempt to produce their own engine starters. They can get American starters quite easily—there are a number of American engine-starting and lighting systems available on the British market—but they won't have 'em. "No demand" appears to be the all-sufficing excuse for the lack of attempt to create a demand. The whole subject of engine starters is dismissed with an airy wave of the hand as an American foible—a something too indefinite in its possibilities for serious consideration by serious persons; a bubble, perhaps.

Advantages of Starters Overlooked.

This despite the fact that it has been proven time and again that the advantage of an engine starter as a convenience, and as a means to the postponemnt of the inevitable decease of the engine because of old age, is second only to its importance as a live-saving instrument; and as a medium through which to eliminate positively the danger of personal injury caused by back kicks or by successful attempts to start the car with the gears enmeshed. These things have been overlooked, quite, along with the merchandising possibilities opened up by an electrically lighted and started car.

"Why are there so few engine starters used in England?" repeated J. A. Prestwich, when questioned by a Motor World man during his visit to the United States as one of the party of British engineers who came across the sea as the guests of the Society of Automobile Engineers. "I think it is simply because there does not appear to be any demand for them," he continued. "The motor car buying public does not want starters; at least, not yet., for the prevailing impression with regard to them seems to be that they are not more than half-baked; that they are liable to give more trouble than they are worth. To me this seems unusual because of the success of the Cadillac car with its Delco system; the owners of these cars seem quite satisfied with them, and it is very seldom that one hears of trouble or of a dissatisfied owner of a Cadillac changing over to a car of another make.

Explaining Away Lack of Demand.

"The reason for the lack of demand can be explained in several ways: In the first place, the average British engine in the medium-priced-car class is a smaller engine than the engine used in American cars selling for about the same amount; this is accounted for by the high tax placed upon rated horsepower by the government, and, though manufacturers have taken advantage of the rating formula by increasing strokes—very considerably, in some in-

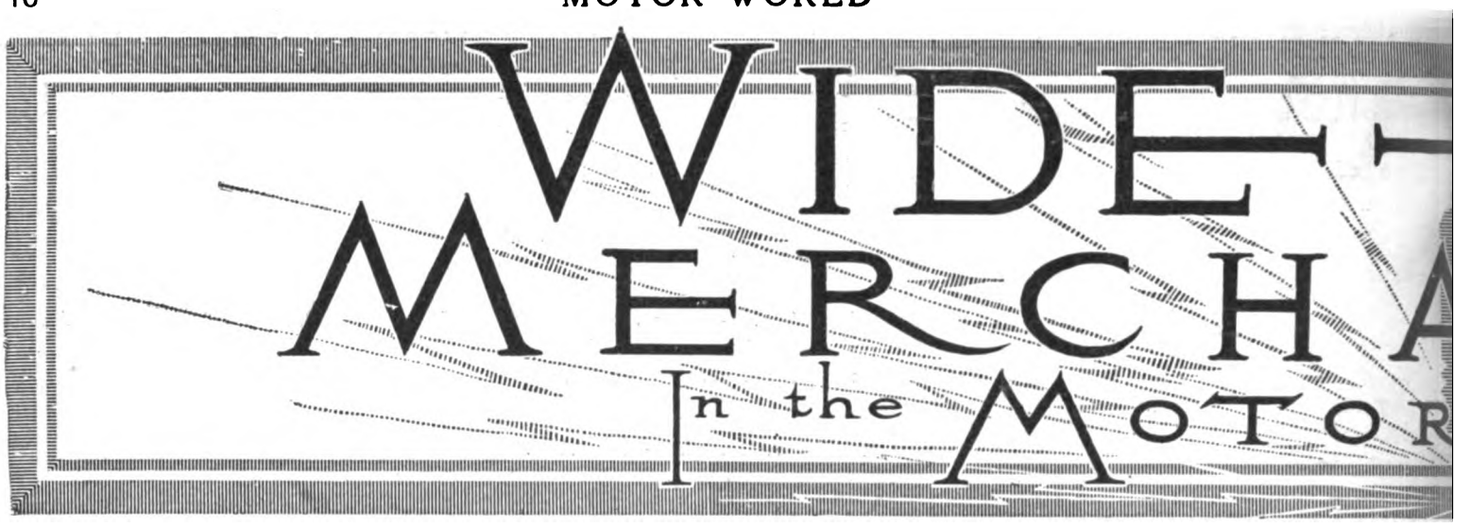
(Continued on page 30.)

MOTOR CLUB DOWNS ATHLETES IN FIRST INTER-CLUB MATCH

Hot Weather and Needed Water Spell Defeat for Milwaukee Athletic Club—One Accident Adds Excitement.

Eleven members of the Milwaukee Automobile Club took on a like number of members of the Milwaukee Athletic Club on Saturday, 28th inst., in the first annual interclub reliability tour between these two organizations, and long before the 22 cars that carried the tourists and their guests got back to the starting point the blue bars of the athletic club were trailing in the dust; the athletic club was roundly trounced by the automobile club, the final score standing 81 to 174. The tour or team contest was run under modified Grade III. reliability contest rules of the American Automobile Association, and the route led from Milwaukee to Lake Geneva and around it and back, the total distance being in the neighborhood of 75 miles.

Of the 22 contestants who started only six were penalized, all the others coming in with clean slates despite the torrid weather and the "bumps" on some of the roads traversed. There was only one thrill in the day's run, and this was caused by J. Fitzgibbons's Kissel, which blew a shoe on a straight, level road and went through a fence, sustaining a bent mudguard; no one was hurt, and as no work was done on the car no penalties were charged. Practically all of the penalties inflicted were for taking on water out of control. The complete score is as follows:



MILWAUKEE AUTOMOBILE CLUB.

Driver and Car.	Penalty.
Dr. C. M. Marcan, Mitchell	55
F. Prinz Stevens-Duryea	25
O. Stegeman, Stoddard-Dayton	1

KEEPING OWNERS' GOOD-WILL

Maintaining Close Touch with Customers Likely to Retain Them—Dealers' Methods, One of Which Won, One of Which Lost, Sale.

Keep in close touch with your customers—you never can tell when they may be ready to buy again. Whether you make the sale or not may depend much on how closely you have kept in touch with the customer.

Too many dealers consider the sale the real point, when as a matter of fact it is being more continually emphasized by both the live automobile manufacturer and the progressive dealer that in reality the sale of an automobile only begins with its delivery and the payment of the cash.

Silence Does not Signify Satisfaction.

The fact that you do not hear from a man with a complaint is no sign that he is thoroughly satisfied with everything, and the fear of encountering unpleasantness is the very best reason in the world why you should make it your business to call and see customers and make sure they are satisfied. Otherwise you may be in the position of the salesman who heard that one of his customers was in the market for a new car. Calling on him immediately, he was grieved and surprised to learn that he had no chance to get the order. He then not only found that the customer was dissatisfied and why he was dissatisfied, but was told that the word of the customer had been pledged to another dealer who had been constantly on the job. "In fact," said the customer, "I have already signed the contract and my new car will be delivered during the coming week."

Diametrically opposite comes the story of a dealer who was trying to sell a Peoria man a high-priced car that he felt sure was better mechanically than the one the car owner was driving. "Your car may be better," said the owner, "but I am not prepared to believe that it is possible to give me any better service than I have been getting from the ——— company. Regularly as clockwork once every three months they write me that their man will be here on a certain day to look over my car. He comes and goes over the car from start to finish. True, there is never very much to do—but he does whatever is necessary, produces a paper which I sign and goes on his way to see other users in the vicinity. This has been going on for over two years and my car, and the service given me, satisfy me thoroughly. I have no desire to change."

REGAL WAY OF REGULATING THE HANDLING OF USED CARS

The method of handling the Used Car problem employed by the Regal Motor Sales Co., Detroit, is to limit the number of used cars that are taken in trade "We never permit ourselves to have on hand more than three used cars at any one time, and in slack months we keep this down to two cars," said Manager Geo. W. Franklin in discussing the subject "Our idea is to take in not only what cars we know we can move readily, and those must be at prices at which we can make a profit.

Unreasonable Allowances Ruinous.

"Too many dealers have their entire season's profits tied up in used cars that are depreciating in value all the time. Used cars must move quickly if you are to get your money out of them. I know one dealer who quoted a prospect a discount of 18 per cent. after the prospect had told him he could get 15 off on another make of car. On top of that he allowed him $700 for a trade-in that he is now offering for $500. How on earth he can break even or even stay in business I don't know.

"I would rather lose a sale than give away all my profits—and I certainly will not jolly myself into giving big allowances for used cars. There is a growing disposition on the part of dealers to be saner in their allowances, and when all of them take a little time off with lead pencil and paper and figure out just where they got off on each of the last half dozen trade-ins it will be for the decided advantage of all. There are so many ways that a firm can lose money in business where it is hard to find the cause, that it is mighty important to make as few mistakes as possible—and the too liberal allowances for used cars is one of the mistakes that nobody should make."

IMPORTANCE OF TABULATING ALL REPORTS ON PROSPECTS

The proper recording and tabulating of prospects and the salesmen's reports thereon is one of the most important and vital details in the conduct of an automobile business. Don't let your men lose a day or a week in turning in reports. Make them report daily. That will give you a chance to act and use your judgement while the situation is hot. There is a psychological moment. The dealer who watches the reports of his salesmen carefully and supplements them by personal conversations will discover many of these psychological moments and get business that would otherwise slip by.

ONE MORE ESTIMATE OF THE "CHIEF CAUSE" OF FAILURE.

"The chief cause of failure—in business and out—is that men don't go back often enough; their courage dwindles and they look for an easier corner," says a writer in a recent issue of the Saturday Evening Post. There is a lot more in this statement than appears on first blush. It applies to the ordinary conduct of a business with its multitudinous worries, disappointments and unexpected happenings. It applies with equal force to the activities of the sales force.

MAKING COURTESY AN ASSET

Impoliteness May be Productive of Disastrous Results — Incident Which Forcibly Impressed the Fact Upon a Truck Dealer.

The reputation of being courteous and pleasing is not difficult to acquire, and it is a business asset that grows with the spreading of one's reputation.

This fact is sometimes brought home to a man in the way of antithesis. For example: A large dealer in trucks attended a circus and arriving late, was unable to secure reserved seats with the result that he and his family were forced to seat themselves on a mound of straw placed in front of the grandstand. As luck would have it, in front of him was a man who persisted in standing up on his knees and obscuring the view. After a short time patience ceased to be a virtue and the truck dealer called out "Sit down, please." No attention being paid to his request, he waited a little longer and then yelled, "Sit down, you boob!" This time the man looked at him and then turned his back on him. A few more commentary names were hurled at him, and finally he shifted his position. The truck dealer was contented and forgot the incident.

Meets Man Whom he Had Called "Boob."

Several weeks later one of his men called him to go with him and assist in closing a large deal. Judge of his surprise when he was confronted with the very man whose seat at the circus had proved so very objectionable to him. The man did not appear to remember him, but he was unable to close the sale, and he has carried with him ever since the conviction that the circus incident had a lot to do with his failure.

Whether or not this was the case only the truck buyer knows to this day, but one thing is certain, then and there the dealer wrote indelibly on the tablets of his memory the little line, "Be courteous and polite anywhere and everywhere, for it pays."

ONESELF AS AN INVESTMENT; HOW TO MAKE IT PAY BETTER

When you feel tired, lazy and indifferent, that's the time to give yourself a mental overhauling. Keep books on yourself. Know yourself all ways. What you will find out by "keeping books" of this sort will surprise you. Incidentally, it will enable you to add immeasurably to your business efficiency.

If a man had an investment that he himself managed and it brought him in an income of $4,000 a year, he would watch it carefully. He would study day and night to see how it could be increased. He would take pencil and paper and see where he could trim this or that item of expense. Then he would lay out and plan additional machinery, building, equipment and labor, as the case may be, that would be necessary to multiply his production. He would not do it in his head. He would put it down on paper.

The man whose services net him $4,000 a year is drawing virtually a 10 per cent. income on a $40,000 capitalization. He himself for income purposes represents a cash value of $40,000. That is a lot of money. It represents an investment that should be watched and planned for with the utmost care. It should be fostered and developed to assure a substantial yearly increase in value. What are you doing in that direction?

GETTING THE MOST OUT OF DEALERS' PROSPECT LISTS.

A Detroit dealer who regards his prospect list as one of the most important details of his business has corrections made every day. They are not held over a month or a week; he insists that all changes and corrections be made within 24 hours. The result is a list worth real money. There is no chance to accumulate a long "dead" list that no one knows very much about.

Too many dealers have lists that sadly lack up-to-date information. They do not even know whether or not the prospect has made a purchase. The dealer referred to also enforces a rule that when a salesman does not report a call on a prospect within thirty days the prospect belongs to the "house." As the men are all working on commission, it will be readily seen that this keeps them hot after the business with a golden reason for "clinching things" wthin a specified time.

HELPING EMPLOYE AS WAY OF HELPING ONESELF MORE.

As long as men are human there will always be some weak spots. How do you help your men? Do you help them or do you just leave them alone and hope that they will work out their own salvation? The big prizes are for those who can handle men—who can help them to do better—and do it from the practical standpoint of having done it. You cannot help men unless you know more than they do. How can you know more? By increasing your knowledge, by expanding your brain power. By dealing in facts instead of guesses.

When Copying Forceful Man is Helpful.

Do you lack force or aggressiveness? Picture in your mind the most forceful and aggressive man you know. Imagine what he would do under circumstances that you are about to encounter. Then act as if you were that man. You will find that this plan has a practical value that can only be appreciated by trying it. Persistency, energy, enterprise can be developed in the same way. Don't sneer at the suggestion. Try it.

UNCLE SAM REVISES MOTOR CAR STATISTICS FOR 1909

Belated Corrections Make Important Changes in Census—265 Instead of 316 Automobile Factories—More Cars and Capital.

Final revision of the preliminary census figures for the year 1909, which first were made public two years ago, has resulted in the amendment of some of the statistics applying to the automobile industry, which statistics are the subject of a bulletin which is being made ready for publication by the Census Bureau of the Department of Commerce.

As outlined, the final figures indicate that in the grand totaling-up the statisticians found nearly 1,000 more automobiles than originally reported, the final count showing a total production during 1909 of 127,289 cars instead of 126,593, as originally reported. It has also been found that while the total value of automobiles, including bodies and parts, was $249,202,075, $84,986,000 is the value of such products reported by establishments chiefly engaged in the manufacture of bodies and parts, instead of $55,378,967 as was indicated by the preliminary report.

The number of factories producing complete automobiles in 1909 proves to have been 265 instead of 316, and the average number of wage earners connected with the industry in 1909 also totals 75,721, instead of 51,294, their wages being $48,694,000 instead of $33,180,474.

In the revision, the total capital invested in the 265 factories producing complete automobiles was found to be $173,837,000, instead of $134,592,965 as was indicated by the preliminary figures.

According to an outline in the forthcoming bulletin which just has been issued by the Department of Commerce, of the 743 establishments engaged in the manufacture of automobiles, including bodies and parts, in 1909, only 265 manufactured complete automobiles as their product of chief value, but these establishments employed more than two-thirds of the average number of wage earners engaged in the entire industry.

The total value of products in the year 1909 for the two branches of the industry combined was $249,202,075, of which $193,823,108 was the value of products reported by the establishments engaged principally in the manufacture of automobiles, and $55,378,967 that reported by establishments manufacturing principally automobile bodies and parts.

The total which is obtained by adding the figures for these two branches of the industry involves considerable duplication, however; probably a better measure of the actual value of the products of the automobile industry in 1909 would be the total value of the complete machines manufactured, which was $164,269,324.

Of the 126,593 automobiles turned out by establishments of the industry in 1909, all but 23 were made in establishments reporting complete automobiles as the product of chief value. In addition to the automobiles manufactured by establishments assigned to this industry, 694 automobiles were reported by establishments engaged primarily in the manufacture of other products.

As already is well known, Michigan was the leading State in the industry, holding first rank at the censuses of 1909 and 1904 in respect to the average number of wage earners employed, the value of products, and the value added by manufacture. In 1909 the factories in Michigan reported 33.6 per cent. of the average number of wage earners employed in the industry, 38.8 per cent. of the value of products, and 36.4 per cent. of the value which was added by manufacture.

The total number of persons engaged in the industry in 1909 was 85,359, of whom 75,721, or 88.7 per cent., were wage earners, 2,564, or 3 per cent., proprietors and officials, and 7,074, or 8.3 per cent., clerks—a class which also includes other subordinate salaried employes. Of the persons engaged in the industry in 1909, 82,918, or 97.1 per cent., were males and 2,411, or 2.9 per cent., were females. The average number of children under 16 years of age employed as wage earners in the industry in 1909 was 162, of whom 159 were males and 3 were females.

In both 1909 and 1904 more than five-eighths of the total number of establishments were under corporate ownership, the percentage being slightly higher in 1909 than in 1904. This group of establishments, however, contributed a much larger proportion of the total value of products in 1909 than in 1904, 94.6 per cent., as compared with 88.1 per cent. The proportion of establishments under individual ownership increased slightly during the five-year period, but the value of products reported for this group formed a smaller percentage of the total in 1909 than was the case in the year 1904.

Of the 743 establishments reported as engaged in the industry in 1909, 56, or 7.5 per cent., had products valued at more than $1,000,000 each. The corresponding figures for 1904 were 10 out of 178 establishments, or 5.6 per cent. Although these establishments were relatively unimportant numerically, they reported a large proportion of the total value of products, the percentage for 1909 (68.4) being much larger than that for 1904 (46.6).

Of the automobiles turned out by establishments engaged in the industry in 1909, 95.1 per cent. were gasolene vehicles, the proportion being considerably larger than in 1904 (86.2 per cent.). The number of gasolene automobiles made in 1909 was more than six times as great as the number made in 1904. Steam and electric vehicles gained in number at a much less rapid rate, showing increases of 51.4 and 168.5 per cent., respectively, and each of these total number in 1909 than at the preceding classes formed a smaller proportion of the census. In 1904 more steam than electric automobiles were reported, but in 1909 the reverse was true.

Michigan was the leading State at each census in respect to both the total number and total value of motor vehicles manufactured. The automobiles made in Michigan, where the industry is largely centralized, represented 51.2 per cent. of the total number and 42.8 per cent. of the total value in 1909, and 42.1 per cent. and 27.6 per cent., respectively, in 1904.

Indiana and Ohio ranked second and third, respectively, in 1909 in the total number of automobiles produced, but in the value of the output Ohio was second and Indiana third. While less than half as many automobiles were made in New York as in Indiana, the value of all machines produced in the former State was practically equal to that reported for the latter division of the country.

More than half (64,262, or 53.4 per cent.) of the total number of gasolene automobiles and nearly half ($69,139,223, or 45 per cent.) of their total value was reported by Michigan in 1909. Ohio was the leading State in the production of electric and steam automobiles, reporting 37.6 per cent. and 81 per cent., respectively, of the total value of these machines in 1909.

Of the various classes of automobiles, the most important in point of numbers and of value is that of touring cars, the total number of such cars manufactured in 1909 being 76,114, with a value of $113,403,188, as compared with 7,220, valued at $11,781,521, in 1904. Such cars represented 60.1 per cent. of the total number and 69 per cent. of the total value of the automobiles which were made in 1909.

The following table gives the figures in detail:

	1909	1904	Per cent. of increase
Number of establishments	265	121	119.0
Persons engaged in the industry	58,142	11,246	417.0
Wage earners (average number)	51,294	10,239	401.0
Capital	$134,592,965	$20,555,247	554.8
Wages	$33,180,474	$6,178,950	437.0
Value of products	$193,823,108	$26,645,064	627.4

"GETTING THE JUMP" ON MAN WITH COMPLAINT

Dealers Who Anticipate Trouble and Adverse Criticism and Use Effective Forestalling Methods—Service "Commutation Ticket" as an Assurance of Satisfaction—Systems That Bring Increased Sales.

Two little boys in a "York State" district school, which still stands in the midst of its bare-worn playground and knife-carved trees, were very happy boys one winter day years ago when a stereopticon show visited the district and the proprietor offered prizes to the boys who sold the most tickets; one of the boys had been a "city kid," while the others had been born and brought up in the country, and what that "city kid" did to those country boys was a shame.

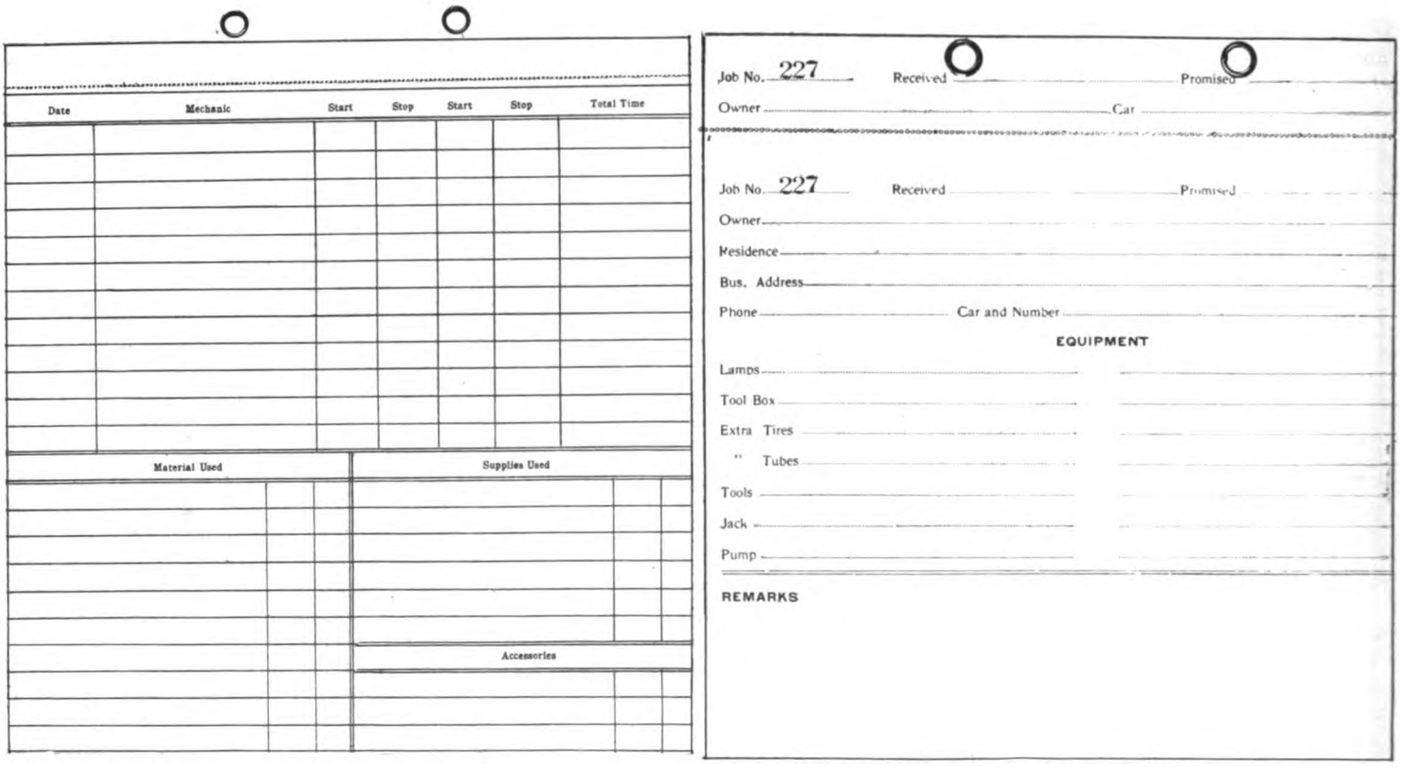
They all set out to sell tickets, but nearly everywhere the country boys went, on any road, at any house, they found that that "darned city kid" was about one jump ahead. Who won the prize? Don't ask such foolish questions. The "city kid" had put into practice a principle which is just as good in business for grown-ups, as may be attested by the dealer who is continually nettled to find that some dealer or dealers are just "one jump ahead."

Applying the "one jump ahead" principle may be done, however, in a slightly different way, and the way is demonstrated by George F. Little and Charles H. Simerson, who sell Studebaker cars in West Hoboken, N. J., at 1435 Hudson Boulevard, as the Clinton Auto & Garage Co. While they believe in trying to keep ahead of their competitors they also believe in increasing this lead by keeping "one jump ahead" of the prospect. Neither are they secretive regarding their methods, so far as making them known to their competitors is concerned, for while they don't say so in so many words, they appear able to maintain that "one jump" lead no matter how much their methods may be copied.

SERVICE "COMMUTATION TICKET" WHICH ENTITLES CAR OWNER TO FIFTY HOURS OF FREE AND UNRESTRICTED LABOR.

Keep "One Jump Ahead" of Prospect.

Keeping one jump ahead of the prospect is one thing which enables them to keep the same distance ahead of their competitors, and it is nothing more or less than anticipating the next move of the prospect and "beating him to it"; before he has had a chance to advance an argument or make a complaint, provided he has become an owner, these dealers endeavor to forestall him, and, paradoxically, correct things before they go wrong.



Their methods are exemplified in the concrete by their handling of the service problem; they aim to give the new owner a requisite amount of service, but not an extreme amount, and they aim to make service an amiable meeting ground between dealer and owner. The concrete illustration is contained in a "service meal ticket," which is shown in connection with this story, and it is giving the best of satisfaction. It entitles the new owner to fifty hours of free labor on his car, and in the margin of the card are hours and half hours to be punched out as the work is done. It is sent to each car buyer encased in a neat leather case, which also provides room for the owner's driving license, and must be presented whenever work is desired.

Before this card was placed in service there was often dissatisfaction of a minor nature on the part of owner and dealer regarding the matter of service. An owner would buy a car and while he had been told he would be taken care of he often hesitated to bother the dealers for trivial things, and there was encountered now and then an owner who thought he was entitled to an unlimited amount of service and did

Digitized by Google

not hesitate to ask for it. Some owners wanted more than fifty hours of labor and others were satisfied with less, so the dealers estimated that fifty hours ought to be a fair average, and acted accordingly.

Of course, any replacement of parts which does not come within the guarantee, any accessories, any supplies or any material is charged for, but this card says to the owner: "We will give you fifty hours of labor; it doesn't make any difference whether it is tightening up a nut or whether you run your car over the edge of Palisades and smash it, we will give you fifty hours of labor without a cent of cost to you. It's your; use it when and as you please."

REVERSE AND OBVERSE OF NEW JERSEY DEALERS' REPAIR CARD WHICH FURNISHES IRREFUTABLE RECORD

Donated Work Has No Restrictions.

This method varies from the service given in many establishments, for the term service is often taken to include only such repairs as come from ordinary running, and repairs due to accidents are charged for; this may be right in principle, but these New Jersey dealers avoid all chance of disagreement by making a donation of fifty hours of work and having the whole question forever settled. It also makes an owner feel free to have any adjustments and minor repairs made, and for ordinary usage the card will cover very close to the year for which it is given. The card puts the dealers one jump ahead of the owner; it anticipates any service disagreements and keeps the owner satisfied.

In the repair-shop the same principle is in effect; when an owner brings in his car to have work done upon it a job card is brought out and he is requested to write under the heading "Remarks" the work he wants done. The stub of the card goes to the shop with the car and the larger section of the card is kept in the office; one side of the card contains a record of the job number, when the car was received, when it was promised, the owner and address, and the equipment in the car. The other side contains a time record, showing to the minute how much time was put in on the car, and provides a record of material used, supplies used or accessories installed. This record card, from the dealers' standpoint, is another trouble preventer; in case an owner is inclined to dispute as to the work the dealer has in black and white the owner's order and the time and material required. Should an owner be a lover of litigation the card furnishes an almost irrefutable record.

How "Gas" and Supplies Are Vended.

Gasolene, oil and supplies are furnished the owner with another indisputable record; a billing sheet provides a space for the date, the amount bought and other necessary items and every time anything is supplied to an owner he or his chauffeur signs in the "attest" column to the effect that the goods in question were delivered. At the end of the month gasolene and oil are totaled at the prevailing price and the bill is sent to the owner. A carbon record is kept by the dealers. The original of the bill is blue and the carbon copy yellow, thus preventing the two from getting mixed in any way. The names of the owners are kept on an index sheet in the front of the filing book, and it is a matter of seconds only to turn to the account of any customer.

Simerson is the mechanical genius of the firm and cares for the garage and shop work; the business is housed in a one-story structure, 185x50 feet, with a basement at the rear which has an exit to a side street of lower elevation than the street in front. A 50x50 addition is contemplated. The garage is open day and night and some one is always in attendance to care for the owners. Most of the washing is done at night, and some member of the firm and an employe or two are always on hand Sundays.

Blackboard to Make Directions Sure.

To render a convenience to owners a blackboard, about 2½x3 feet, is located near the garage door, upon which an owner, should he enter at night, may write directions to the firm as to what he wants done with his car. The order thus recorded cannot be overlooked, and any orders received for chauffeurs are posted on this board, where the chauffeur sees them as soon as he enters the building.

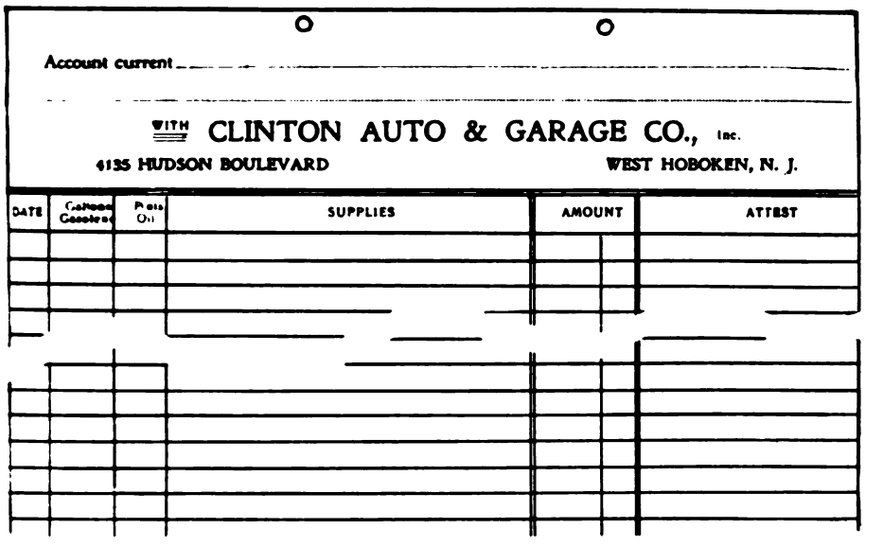
In sales work, too, the one-jump-ahead policy prevails, and that it must have something to do with results is indicated by the volume of sales attained; in fact, some

Digitized by Google

ember of the firm is generally harrying the New York Studebaker branch for more ars. One day a man who lives within these dealers' territory, which consists of Hudson, Bergen and Passaic counties, was n New York, and arrangements were made to sell him a used car which was in the Little-Simerson salesrooms; this arrangement was easily made, because the dealers and the branch enjoy the most amicable of relations.

Clever Exit from Puzzling Situation.

On his way home the new owner stopped at the Clinton Garage and left his check for the car; it was Saturday and the check could not be deposited until Monday, and that evening Little was surprised when the new owner called him up and said there are some things about the car he didn't like.



Here was a quandary; the owner had ample time between then and Monday to stop payment on the check, and Little knew it so he said: "Bring it over and let's see what the trouble is; if it isn't right and we can't make it right we'll give back your check." This move "got the jump" on the buyer, and when he called later he was in good humor; any feeling which might have led to the stoppage of the check had been forestalled. The owner said the cooling system leaked. Little fixed it in a minute with the turn of a wrench and similarly adjusted several other minor difficulties.

Gives Real Reason for Disliking Car.

Then the owner said: "I'll tell you what's the trouble; the boys don't like this car; they want a 'six.'" "I don't blame them," replied Little. "You can get a lot more satisfaction with a 'six'; you'll like one better. I've got a 'six' I'd like to show you. But," he added, "you are under no obligations to buy it and if you want your check before you see the 'six' I'll give it to you now. But I really would like you to look at the 'six' before you go back."

The owner looked at the "six" and he never took that check back; instead he wrote out another one to go with the first one. The sale was saved largely because Little offered to return a check that he knew wouldn't be any good anyway if the owner happened to take a notion to stop payment. This made the owner realize the firm's fairness in dealing, kept him good-humored and, instead of not being sold at all, he was sold twice.

The dealers keep at least two regular salesmen busy and have quite a number of sub-dealers in their territory; by apportioning their field in this manner they effect a larger volume of sales and are enabled to take advantage of the larger commissions under the Studebaker sliding scale, which slides up and not down, like McReynolds's tobacco box. Little was telling of some of the troubles he has had with salesmen and cited the instance of a man who didn't know when to shut up and close a sale.

Account current

WITH CLINTON AUTO & GARAGE CO., Inc.

4135 HUDSON BOULEVARD WEST HOBOKEN, N. J.

DATE	Gallons Gasoline	Pints Oil	SUPPLIES	AMOUNT	ATTEST

BLANK THAT REQUIRES OWNER OR CHAUFFEUR TO ATTEST SUPPLY PURCHASES

Salesman Who Demonstrated Too Much.

"He didn't know when to stop," said Little. "He took a prospect out one day and the prospect asked to be taken up a certain hill in town here. The salesman took him to the top in fine shape and the prospect said, 'I guess that's the car for me, all right.' He was sold right then and there, but the salesman spoiled the sale. He said, 'Huh! That hill isn't anything. Wait until I show you what the car will do on a real hill.' The salesman tried to climb another hill, which the car was able to climb, but the carburetter just happened to go wrong and the prospect changed his mind. If the salesman had let well enough alone and sold the car when it was sold he would have been all right."

"Who is he—one of your salesmen?" asked the Motor World man.

"Not now," was the sufficient reply.

One of the firm's assets in the way of salesmanship is the varied experience of Little. He might have been the head of a good carriage and automobile manufacturing business in Canada now if his father hadn't let the insurance lapse just before a fire that cleaned out the whole plant. That was years ago, and since then Little has been a British cavalryman, an electrical salesman in China, an Oriental pottery merchant, a manufacturing jeweler and a few other things too numerous to mention. But as long as he is selling something he is quite happy.

The Motor World man looked at Simerson, a little but rugged man, and hesitated to believe that Simerson was old enough to be Little's father-in-law, but such is the case. Also there is a little Little who is very popular with his granddad and the whole establishment is operated with the "kid's" future as an object. Judging from the number of sales the firm pulls in, the youngster is a big asset for the Studebaker Corporation.

Odd Effect of Long Ignition Cables.

A wire which is used as a conductor of electricity may become so charged that it retains electricity after the flow from the source of supply has ceased; in other words, it has a static charge. If the wire is long enough it may contain a fairly strong static charge, and for this reason motors in which very long high-tension cables have been used have suffered all sorts of ignition trouble, due to the fact that the static charges would pass off across the plug points and ignite the charges at odd times and in highly puzzling fashion. Shortening the wiring has had the effect of remedying the trouble. The use of metal cable containers also breeds the same kind of trouble and should be avoided.

The Repair of High-Tension Wiring.

If the insulation of a high-tension cable becomes so chafed or otherwise damaged as to permit current leakage, the usual makeshift repair can be made with tape, and this will answer for a while; but it should be borne in mind that friction tape is not a particularly good insulator for currents of high voltage. Rubber tape is much better and will hold the current within bounds where the friction tape will not. In any case, an imperfect high-tension cable should be replaced at the earliest possible moment, as it is merely an invitation for trouble sooner or later.

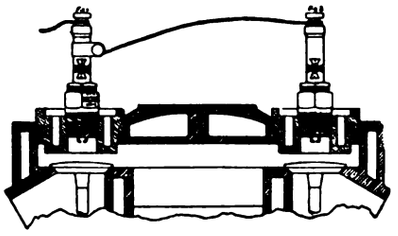
RECENT DEVELOPMENTS in ACCESSORIES

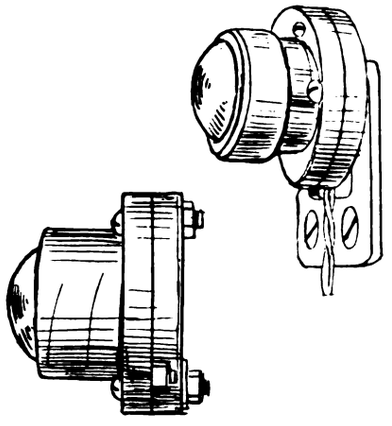
Two-Plug Principle Newly Applied.

Working on the theory that two sparks, occurring simultaneously at different points in the combustion chamber of a cylinder, will cause quicker, more thorough and more powerful combustion of the charge than a single spark, the Ideal Switch Co., Inc., of Plainville, Conn., has designed special plugs to be used for this purpose. As the accompanying illustration shows, the plugs are wired together in pairs, in series. One plug to which the magneto terminal is attached, is not grounded, both electrodes being insulated, while the second plug is grounded to the cylinder in the usual way, a wire being carried from the negative point of the first plug to the positive of the second. The current therefore must jump the points of both plugs to reach ground, and in so doing produces two sparks. The plugs are made in pairs, of any length and any thread, and are priced at $3.25 per pair.



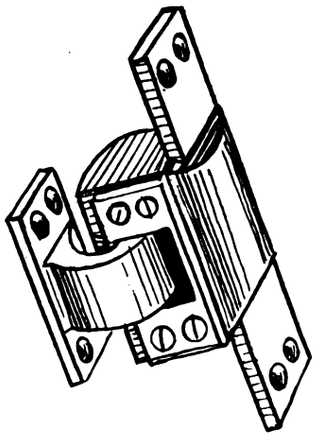
Concealed Hinge Comes from Detroit.

Like other details in automobile contsruction that showed weakness in earlier models, the hinges of side doors have received so much special attention from specialty manufacturers that the better types now are far removed from the flimsy fittings that once were common. One of the latest ideas in hinges is embodied in the device shown in the accompanying illustration and manufactured by Parsons-DeVleig & Co. ot Detroit. The chief advantages of the new hinge are that it can be applied inside the body and will not loosen with the swinging of the door; that the door may be lightly framed and yet strong because the hinge does not necessitate cutting away the angle flange of the panel; and that there are no wood-screws to be puttied up on the face of the pillar, which ensures a clean job. Labor is saved in putting on hinges, as they are applied while the door is in its closed position.



Dry Battery Lamps of Hard Rubber.

That indefatigable producer of multifarious automobile specialties, the H. W. Johns-Manville Co., of New York, just has brought out a real novelty in the lamp line—an automobile lamp which not only is claimed to give efficient and economical service on dry cells, but is made of hard rubber instead of metal. These J-M Mobilites, as they are named, are made in three types, one for insetting in the dashboard, one for an inside dashboard light and one for a tail light. A portable lamp is also made by attaching a spring clip and a long cable to a dashboard lamp.



The accompanying illustrations show the general appearance of the lamps. The bodies, of hard rubber, are said to be extremely hard and durable; they do not require polishing, a wipe off with a cloth being all that is needed, and they are not as easily dented as metal bodies. Powerful reflectors and lenses serve to intensify the light produced by the tungsten bulbs. The tail-light has an opening in the bottom through which light is thrown on the license number, and also has a concealed switch, which carries out the requirements of the laws of the several States where the tail-light must be rontrolled from the rear of the car. The switch is so hidden that the meddlesome small boy cannot locate it. It is estimated that the cost of operating on dry batteries is one-third that of the usual lighting equipment. Six No. 6 dry cells are said to run a set of four lamps intermittently for from 80 to 120 hours.

IDEAL DOUBLE PLUG

J-M HARD RUBBER LAMPS

PARSONS-DE VLEIG HINGE

Air Compressor Resembling Gun.

For the purpose of marketing a gatling air gun, a new type of air compressor, invented by Charles Milne, the Schaefer-Frenzel Co. has opened offices in the Dime Savings Bank Building in Detroit. The officers of the company are: President, Jos. E. Schaefer, previously identified with the spark plug business; vice-president, H. Roy Haberkorn, a Detroit contractor; secretary-treasurer, Arthur W. Frenzel, who was until recently connected with the Disco Co. The company has a manufacturing plant on West Fort street in Detroit. The device is termed a gatling gun because of the arrangement of the cylinders, which somewhat resemble that of the W. K. bullet shooter, and also because of the force and rapidity of its operation.

To Make "Gas" and Oil Slot Machines.

The Indianapolis Corrugating Co., of the Indiana city of that name, is making ready to place on the market a money-in-the-slot gasolene vending machine. It is the invention of H. C. Johnson, of Knightstown, Ind., and takes the form of a sheet steel cylinder, about seven feet high by three feet in diameter, which will hold 100 gallons of gasolene. There will be slots for the insertion of 25-cent, 50-cent and one-dollar coins. There also will be a separate reservoir for containing lubricating oil, which likewise will be dispensed on the slot system.

Light-Dimmer to Fit all Cars.

The Suburban Lighting & Engine Co., of Toledo, Ohio, has developed and are placing on the market a dimming device for headlights. It is applicable to any make of car and retails at $2.50.

"SHOOTING OVER THE HEAD" OF THE PROSPECT

Language That Is Not Thoroughly Understood by the Man to Whom the Salesman Talks Is Wasted Effort, Declares Reilly—Cites Dealer Who Thought He Was Making an Impression With Deep Discourse.

"Just around the next point."

Reilly twisted himself into a more comfortable position in his heap of cushions in the stern of the boat and repeated this answer, which he had been doling out parrot-like ever since the Sales Manager pulled away from the little lakeside summer resort with the avowed intention of rowing the party for a Sunday shore dinner to a spot that Reilly had suggested. It was "such a pretty little spot just down the lake a little way."

The wives of the two men, seated comfortably amidships, giggled a little as "just around the next point" came in response to the Sales Manager's now frequent inquiry as to how much further it was.

"My ——! Reilly," exclaimed the moist-browed oarsman, who came to a rest. "I've rowed around five or six 'next points' already. Enough's too much."

"You said you'd row if I paid for the boat, didn't you?"

"Yes, but——"

Sales Manager Balks at His Bargain.

"You said you liked to row, didn't you?"

"Yes, but——"

"Well what are you kicking about? I paid for the boat, didn't I?"

And the Sales Manager rowed, rowed, rowed.

Around the next point, in "that pretty little spot," he beached the boat, climbed out and threw himself on the grass under a tree.

"Come on, help unload; get some wood and start a fire," directed Reilly.

"Can't do it," replied the Sales Manager. "I'm a union oarsman. Rules won't let me do anything but row." And for the remainder of the afternoon he adhered rigidly to his rules

After Reilly had thrown the dishes and the remnants of the dinner into the lake the Sales Manager went back to his place under the tree and the others joined him. Everybody talked about nothing in particular until the two male members of the party got into a discussion of the single tax, which the factory man attempted to explain to he dealer. The explanation was full of "unearned increment," "ratio of labor to capital," and numerous other such terms.

"Do you understand it?" asked the Sales Manager.

"Oh, fine! But what's it all about?"

"Do you mean to say you can't get it?"

"I haven't yet."

"Oh, what's the use!" said the single-taxer in disgust.

"Agh," grunted Reilly. "You're just like Matt Sixby."

"You mean that dealer who failed last week?"

"WHAT ARE YOU KICKING ABOUT? I PAID FOR THE BOAT," SAID REILLY

"The same man; you've been shooting over my head just as he always did."

"Is that what took your hair off?"

"You sorehead! Not over my head; his customers' heads," snorted Reilly. "That's one reason he failed in business," he went on. "Of course, the generally accepted reason was that he couldn't sell cars enough, but the reason he couldn't was that he didn't go at it right."

Dealer Whose Language Was Too Deep.

"Now who's shooting over people's heads?"

But Reilly scorned to notice the sarcastic interruption, and went on: "Sixby, poor cuss, never had much selling instruction and wasn't able to figure things out himself. He used to be a tip-top expert repairman, and he never got over it. He always talked as if every one knew as much about cars as he did and when they didn't about 90 per cent. of what he said went for nothing."

"That's more intelligible."

"In selling a car one of the first things to be done, and probably the only thing, is to make a man want it, and no ordinary man who listened to Sixby could ever want what Sixby was talking about, because he had but little conception of what Sixby was saying. Matt sort of had an idea that to make an impression on a prospect he must hand out a lot of that stuff, that mystifying technical talk, full of engineering terms that mean about as much to an untechnical man as a lot of this Henry George single tax stuff does to me. I suppose, at that, that I might tumble to your explanation if you explained in plain English.

Technical Terms Failed of Object.

"Sixby loved to get a prospect and take him through the maze of a car's construction in a way that would make the ordinary man dizzy. He would start in with the motor and dole out a lot of information about bore and stroke and piston displacement and explain about the heat calories of gasolene and how and why the motor was economical, and he would be so damnably technical that sometimes I don't believe he actually understood himself what he was talking about.

"It didn't make any difference if the prospect showed interest in certain features of the car and was likely to base his purchase upon a proper sales demonstration of the qualities in which he was interested; Sixby just had to tell the story in his own way. He didn't realize that there is an A B C style of English that can be used in describing a car, or if he did realize he didn't use it. An automobile isn't so complex and mystifying that the average man isn't capable of comprehending its make-up if it is put up to him in the right way."

"I suppose you know all about the right way," butted in the Sales Manager.

"I sell a car now and then, don't I?" retorted Reilly.

"And I don't delight in stringing off the nice, big, long words that some people do, either," he continued. "Aside from using technical terms that are beyond the ken of the average man it is also very well to get outside of bookstore English with the ma-

Digitized by Google

jority of people. Just because a man has money enough to buy a car is no sign that he was brought up on the dictionary when a boy. He may have been, but sometimes you hit one who wasn't; anyhow, this high-flown English hasn't the pulling power of the good, old Anglo-Saxon.

Best "Ads" Are Easily Understood.

"If you don't believe it just watch some of the best advertising that is being run to-day and scan it for words that the most ordinary man can't grasp. The best advertisers firmly believe in writing something that any man can understand, and advertising and salesmanship are very closely related, if they aren't the same, or nearly so. If you use simple language you are understood by everyone, both high and low, technical and untechnical; whereas if you begin to complicate matters you are likely to shoot too high for some of your marks."

"But don't you believe a salesman should ues good English and have a technical knowledge of the car?"

"By all means," answered Reilly, who moved along a couple of feet to get into the shade, which had crept away from him. "Using good English and using big words are two entirely different things, and you will find as a general rule that the man who knows the most about the language is the one who is best able to make his talk simple. It's the same way with the technical side of the question; the man who thoroughly understands the car generally is the man who can give the simplest explanation.

Could Have Been Clear if He Wished.

"Sixby was more or less of an exception, and I'm half inclined to believe that if he had wanted to he could have given a very simple and plain story, but he couldn't see that kind of talk as good sales work. He knew a car from the headlights to the trunk rack, and really understood it, too. He is the kind of man who should be able to explain everything about a car so that a man could grasp it. Most prospects don't care to go so deeply into the matter as all that, but Sixby made them, and then didn't make it plain to them. He dragged them into water that was too deep for them, and when they couldn't swim he wouldn't help them out. The result was that many of them instead of floating up to the contract drifted the other way.

"He had Proctor, the jeweler, on his prospect list before I did, and I must give him credit for putting the spark of desire in Proctor. I got Proctor through his wife; I demonstrated to her and when I had her just about won over I went after Proctor and pushed the sale over. Sixby had tried the same thing, but he gave Mrs. Proctor the same kind of a story he gave Proctor, and while Proctor may have grasped parts of the argument his wife was a couple of miles too far down the technical scale to notice it at all.

"What she wanted was something she could understand; she didn't give two hoots about the bore and stroke of the motor and the kind of steel in the springs, but she did want a car that looked good and that rode comfortably. Aside from that, about all she cared for was that it would run without breaking down, and her husband, being an untechnical sort of a man, wanted to be sure we would take care of him after he bought the car, and see that he didn't have too much trouble. I discovered while giving him a demonstration one day that while

"90 PER CENT. OF WHAT HE SAID WENT FOR NOTHING," ADDED REILLY

the car ran well while I had it, he wasn't so sure it would do so when he tried to run it. I simply 'sicked' him onto an owner who, when he bought, didn't know anything at all about a car, and that cinched him. I sold him on service alone.

"Showing Off" Big Words Vain Effort.

"Sixby could have done the same thing; anyone else could have done it. A man who really wanted to know all about the things that Sixby includes in his sales talks probably would have bought one of Sixby's cars before he would one of mine, and Sixby certainly made a few sales on just that line of dope; but you know and I know that this is shooting too high for the average man. What he wants is plain English, and I never have been able to see where a salesman gains anything by springing on a prospect a new word that the salesman hears of himself only a few days previously, and who springs it just to show the prospect that he knows it."

"Do you mean to infer that I drag in big words that I learned the day before yesterday?" demanded the Sales Manager.

"Well——" slowly began Reilly, who was interrupted by the return of the women of the party laden with woodland flowers.

"Isn't the union oarsman about ready to start back?" asked Mrs. Reilly.

"Certainly," replied the Sales Manager, without even moving from his comfortable position. "Will the dock wallopers kindly load the ship?"

Salesmen Preferred Watches to Cash.

Evidence that the money-grabbing spirit is not so rampant as is generally supposed is contained in the result of the Chalmers sales contest, the awards of which have just been announced. It was open to all Chalmers salesmen, of whom 300 competed in five classes, in each of which the prize was the same—a gold watch or $100 in gold—and, inspiring to relate, each of the five winners selected the suitably-engraved watch instead of the cash.

For the purposes of the competition, all towns in the country were divided into five classes, according to population and the number of Chalmers salesmen in each, the successful contenders being as follows: Class A, which consisted of the smaller towns, O. L. Blake, Keene, N. H.; Class B, M. W. Carroll, Jr., Waco, Tex.; Class C, Willard R. Sweet, Providence, R. I.; Class D, S. E. Murphy, Pittsburgh, Pa.; Class E, Harry N. Pyke, New York.

When Greasing May Prove Deceptive.

In screwing down grease cups to force oil to the places where lubrication is needed it usually can be judged how the grease is running by the resistance offered to the turning. But if dirt is allowed to accumulate on the threads the resistance so caused may lead to the belief that the grease is being well forced in when such is not the case. The moral, of course, is that the outside of the cup should be kept clean as well as the inside.

Disco Dimming Device is Developed.

Keeping abreast of the requirements of the times, J. W. Fitzgerald, the designer of the Disco electric starting and lighting system, has developed a device which, when a button is pressed, instantly softens the glare of the electric headlights and renders them unobjectionable for urban use. The new dimmer is now being made ready for the market.

Grossman's Window Contest Extended.

Because of delays in the delivery of lithograph material, the Emil Grossman Co.'s Redhead spark plug window display contest, which was to have terminated July 4th, has been extended to October 1st next. The Grossman company is supplying window dressing material to all contestants.

SUBSTITUTING ELECTRICITY FOR HUMAN MUSCLES

Little Trucks That Run In and Out of Freight Cars, Climb Gangplanks and Burrow in the Holds of Steamships and Make Manual Labor Seem Expensive—Machines and Tractors That Load and Unload Themselves.

Years ago, when freight transportation by rail and by water was slower than in the present high-speed age, when the amount of material handled was less and when people were less impatient to get and to get rid of their goods—when, in short, the whole business of moving freight was a comparatively deliberate and dignified matter—the sight of a long line of lusty laborers, each pushing before him a little, rattling hand truck and moving at a snail's pace, aroused no particular feelings of displeasure in the breasts of either shippers or transportation officials. The hand-trucking system was old, firmly established and answered the purpose. Anyway, there was nothing better in sight, even if anyone had thought of clamoring for an improvement.

But ships, locomotives and cars have increased in size and speed, freight has increased in quantity and the universal cry is for haste, and still more haste. The demand for time-saving has been so insistent that old-fashioned methods of long-distance transportation no longer suffice. And yet, despite the revolutions that have been brought about in practically every other branch of freight handling, straight through from the shipper's office to the warehouse of the consignee, the vast majority of freight sheds and freight piers still present the same old spectacle—long lines of lusty laborers with rattling, slow-moving hand trucks, with here and there a bigger hand truck for the bigger pieces of freight. Extra heavy pieces are painfully moved about on rollers or skids, or hitched to a block-and tackle and dragged about by main force and brute strength—if there is not a power winch handy—delaying the trucks and taking men away from other work.

There are freight sheds and piers, however, where the time-honored scene has been changed for the better, and while they still are comparatively few, and while the change is not complete in that there is an incongruous mixture of the old and the new, it is even easier to foresee the ultimate decline and fall of the hand-truck army than it was to foresee the decline and fall of the horse-drawn commercial vehicle. There are freight sheds where the ranks of the hand-truckers have been thinned, and in place of every half-dozen or so of missing hand-trucks there is a little, low, solid-looking electric truck that moves swiftly and quietly; that dodges in a way that appears reckless, but is not; that carries the heavy pieces without fuss or delay and can drag even more than it can carry; and that is handled by a man who has dropped the hand-truck to learn the levers.

SHOWING OPERATION WITHIN A RAILWAY FREIGHT CAR

GENERAL VEHICLE ONE-TON INDUSTRIAL TRUCK IN WAREHOUSE USE

It is some six or eight years since the little industrial truck began to make a serious impression upon the minds of the

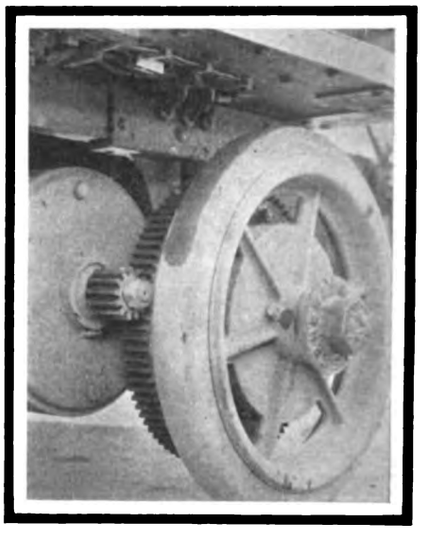
Digitized by Google

powers that rule the transportation companies, and it may be remarked that the progress made has been somewhat slow, due to the conservatism of most of the railroad and steamship men as well as to the inevitable difficulties that beset the development of a new type of machine. That the pressure from all sides is having its effect, however, is plainly evident from the busy factories of manufacturers of industrial trucks, the long and growing lists of users and the increasing number of terminals where the hand truck is giving way to the electric machine.

As for the uses to which an electric warehouse truck, or industrial truck, or utility truck—various terms are used for the little workers—they are well-nigh countless; not only will they do practicaly everything that hand trucks will do and do it much quicker, but they will do work that cannot be done with hand trucks. For instance, some machines will climb grades as steep as 25 per cent., and 20 per cent. is climbable for any of them with normal load. This means that where inclined ways have to be used for getting goods from one level to another a very steep incline can be used, which is not possible with two-wheeled man-propelled trucks. An electric truck will run in and out of a steamship when the state of the tide is such as to bring the gangplank to a grade that would be insurmountable to other carriers. Owing to this tremendous pulling power, not only will the machine carry a good load of its own, but it will haul, on the level, a train of trailers which may be loaded and unloaded while the power vehicle, which, of course, can earn no money by standing still, is running with other trailers.

Trucks that Load Themselves.

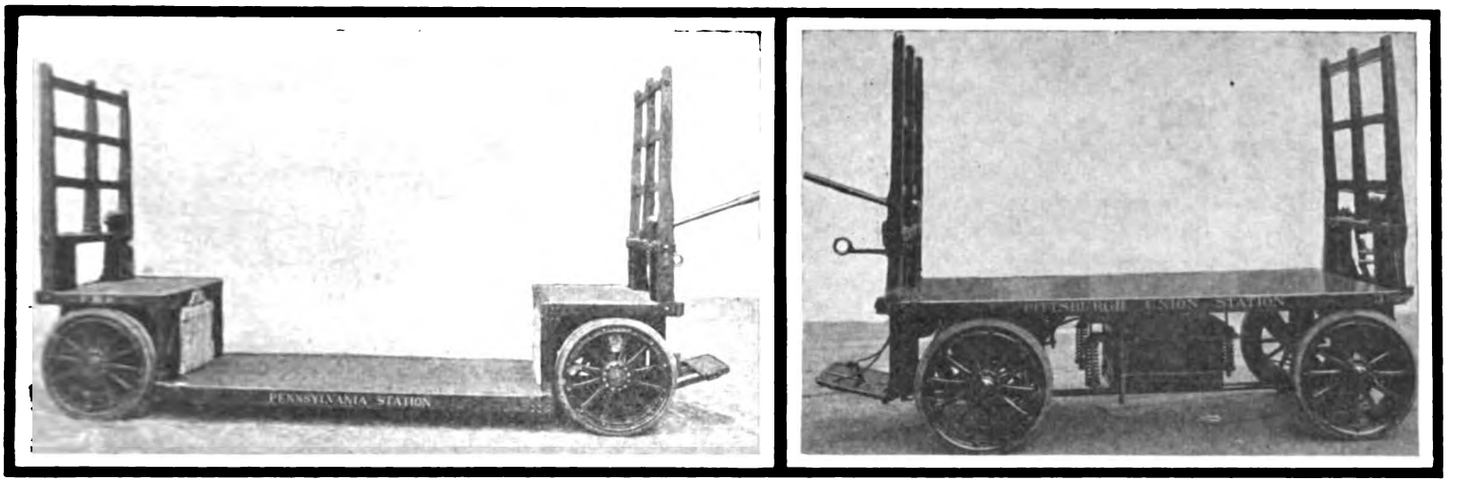
A special development of the industrial truck is the crane truck, which is practically the regular truck with an electric crane mounted on its platform. Such a machine will run up to a gondola car, reach over with its steel arm and pick up a load, hold it suspended and run any reasonable distance and then deposit the load at any point between the ground and the maximum lift of the crane. The crane truck will load its own trailers either from the ground, from a car or from a platform, back up and couple on, haul them to the unloading point, lift off the load and run back for more. A crane truck with a loading space in front of the hoisting gear will carry a "package" that is so long that it could not be handled otherwise, the overhang being supported by the hoist. There are so many uses, in fact, for the whole family of warehouse trucks that the mere recounting of them would fill a volume.



SHOWING OPERATION OF GENERAL VEHICLE SELF-LOADING CRANE TRUCK

One of the earlier applications of the machine was to the handling of baggage on station platforms, and this application is one that is of no small importance in view of the exact schedules on which trains are run, the large quantities of baggage that must be handled in short time limits and the very considerable distances that must be traversed in the huge modern stations. A load that would be totally impracticable for a hand truck, by reason of its weight, can be handled by a power baggage truck at a speed that men could not attain with a hand truck, and, for that matter, would not exert themselves to do so if they could.

A truck of the ordinary type will run right into a box car through the ordinary side doors without the slightest difficulty, and make the necessary turns with ease. There is no necessity for turning in a circle inside the car, for the little machines invariably are run with equal facility in either direction, and merely run in and reverse to run out. Some of the trucks, however, can actually turn completely around in a box car, having a minimum radius of only 7 feet, which is quite small enough for the purpose.



The volume of work that can be done by a crane truck is not a little surprising. In regular service, such a machine has picked up, moved 300 feet and deposited 60 barrels, each weighing 800 pounds, within an hour—and that with only two men, one running the machine and the other attending to the attaching and detaching of the tackle. A gondola car was cleared of 32 tons of castings in 5 hours, there being 360 pieces. In a warehouse a lot of boxes of hardware each box weighing half a ton, were lifted, carried 30 feet and neatly piled at the rate of 40 boxes an hour. A week's work for one of the crane trucks and its trailers in use at the Bush Terminal, Brooklyn, shows that the machine handled 7,570 packages aggregating 860 tons and averaging 230 pounds each, moving the stuff an average distance of 900 feet. The heaviest total load was 12½ tons. The cost, including the wages of the operator, interest, depreciation and electric current, was $24 for the week, or 3 cents for moving a ton 900 feet.

GENERAL VEHICLE DRIVE GEAR

In the handling of baggage there are various angles from which the truck may be viewed. The passenger likes to see his baggage whisked around in a quick, busi-

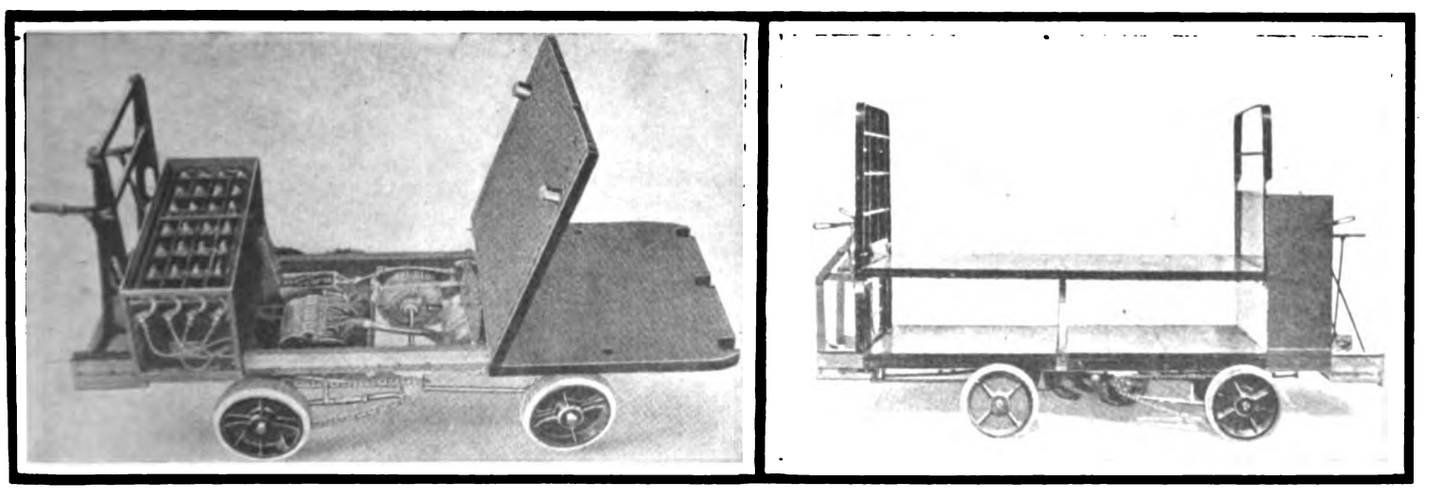
TWO TYPES OF ELWELL-PARKER ELECTRIC BAGGAGE TRUCKS SHOWING DROP AND STANDARD FRAMES

ness-like way, and also appreciates the noiselessness of the rubber tires. The station master rejoices that there is less desperate haste to get everything on board before leaving time. The men who handle the baggage also appreciate the relieved tension at leaving time and, needless to say, they would much rather push a lever than a load. The accounting department, however, has an eye single to the dollars and cents involved, and naturally likes the looks of a report that shows too.

Two single trucks, handling miscellaneous freight in regular, everyday service, have handled 170,000 pieces of an aggregate weight of nearly 6,000 tons in 26 working days, hauling the freight an average distance of 158 feet at a cost of a shade more than a tenth of a cent per ton, figuring in interest, depreciation, maintenance, power and labor. It is not always an easy matter, however, to determine just how good electric trucks are, as compared financially with hand trucks, and this is particularly true with regard to some large users of both. The Hamburg-American steamship line, for instance, which uses 14 electrics at its Hoboken pier—Automatics, Elwell-Parkers and Lansdens — states that "The difference in running expenses between the automobile trucks and hand trucks on our piers cannot be determined in percentage, but where a large amount of freight has to be transported and a long distance must be traveled, there is a great saving in the use of automobiles."



Why Construction Must be Rugged.

In the design and construction of these little machines a number of factors enter which do not apply, or at least not so forcibly, in the building of large motor trucks. The motive power is limited to electricity not only because of insurance regulations, but because electricity permits the simplest possible construction and the easiest and nearest to foolproof controlling means, and is best suited to the short-distance work that is involved.

Men employed to handle trucks that carry freight are not graduate electrical engineers, and it is only to be expected that they will do things to their trucks that must be extremely hard on the mechanism; yet the machines seem to thrive on it. The rule seems to be that if the operator thinks a thing should be done, he puts the truck at it. If the machine does it, all well and good. If not, no harm seems to be done. And it is in the very fact that the truck will stand such treatment that a large part of its value lies.

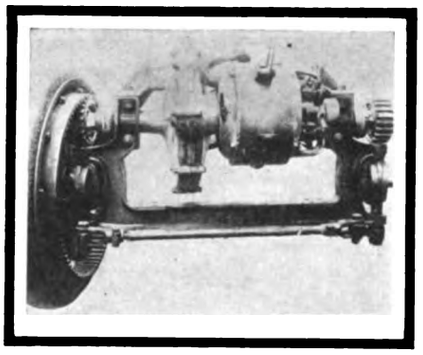
The sort of construction that makes it possible for a hard-working truck to stand what industrial trucks must stand is well exemplified in the General Vehicle Co.'s product, in which simplicity seems to have been reduced to its lowest terms. In the standard type with a capacity of one ton there is but one motor, one pinion on the motor shaft and one gear on a rear wheel.

The truck has an extreme length of 8 feet and a width of 4 feet, and has 28 square feet of loading space. The cast steel wheels, 20 inches in diameter and shod with 2½-inch solid rubber tires, are under the platform and out of the way. The motor is hung close to the right rear wheel which it drives and is behind the axle, and the battery of 44 cells is in the otherwise unused space under the middle of the platform.

AUTOMATIC WAREHOUSE TRUCK SHOWING MECHANISM AND A DOUBLE-DECK BAGGAGE VEHICLE

Digitized by Google

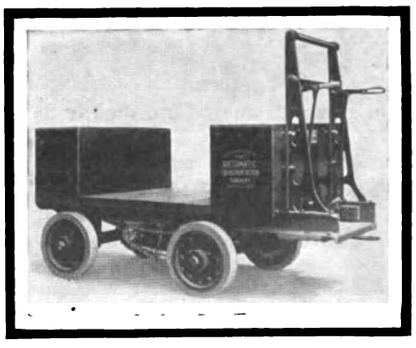
Space on the platform being valuable, the operator is placed on a little shelf projecting from the rear end of the machine. It may be said, however, that the terms front and rear are used mainly for convenience, for the truck works equally well in either direction, the only difference being that in going one way the operator is in front of his load, and going the other way he is behind it. The end designated as the rear is that at which the driving and controlling apparatus and the operator's platform are grouped. The steering is done through the front wheels. Incidentally, the little shelf for the operator, as well as the peculiar braking system, are common to most industrial trucks and have been found admirably adapted to the service.



Control Devices Conveniently Located.

The controlling means consist of two levers with vertical movement so placed that when the operator stands on the platform they are within convenient reach of his hands; one is the steering lever and the other the controller lever. A brake pedal is so placed that the operator naturally stands with one foot on it, pressing it down flat on the floor, in which position the brakes are released. When he raises his foot a strong spring automatically applies the brakes, and at the same time an automatic switch cuts off the current. Thus all that is necessary for the quick stopping of the truck is for the operator to raise his foot from the brake pedal. The controller handle automatically returns to neutral position when released. The weight of the complete truck is the same as that of its load, or one ton. The speed of the truck on level ground, loaded, is 7 miles per hour and the radius on one battery charge 25 miles. For exceptionally heavy grade work and other severe service two motors are employed, driving both rear wheels.

Construction of Self-Loaders.



The General Vehicle crane trucks are of two types—one, the older, embodying more features of the conventional road electric truck than the newer type, which is identical,, in many respects, with the small machine described. The older machine has the appearance of a small electric truck with a seat for the operator and, just ahead, a crane with its electric motor and hoisting gear. The body is not designed for load carrying. The crane will lift a maximum load of one ton, while the truck is commonly used as a tractor and will exert a drawbar pull of 2,000 pounds, sufficient to haul from three to six trailers, according to the loads, grades and distance to be covered.

Drive to the rear wheels is by single motor with double reduction, the first by Morse "silent" chain, which is enclosed, and the second by roller chains to the rear wheel sprockets. Running light, the machine will make 9 miles an hour; with a ton hanging on the crane it will make 7 miles an hour; and towing 5 tons on trailers, 5 miles an hour. These speeds are, of course, figured for level ground. The battery, of 44 cells, 13 plates per cell, is in a box under the driver's seat, and back of it is a tool box. The wheelbase is 64 inches and the tread 60 inches.

ELWELL-PARKER TRANSMISSION

The latest crane truck is built by the Sprague Electric Works of the General Electric Co., and, as already stated, incorporates the cardinal features of the small industrial truck; it has the same simple motor drive, using two motors, and the same platform arrangement for the operator. It is, of course, considerably larger, however, having an over-all length of 10 feet and a weight of 4,500 pounds; the width is 4 feet. The crane, with its operating mechanism, is mounted at the driver's end, which is the steering end of the truck, the driving motors being at the opposite

AUTOMATIC MILL TRACTOR

end. The boom has a maximum height of 15 feet when in its highest position and reaches over a platform space that will accommodate a considerable load; in fact, the machine is termed a self-loading truck. Like the older crane truck, the new machine has a lifting capacity of one ton. The boom does not swing sideways, however, but has only a lifting movement. The turning radius of the machine—13 feet—is sufficiently short to make it easy to maneuver the whole truck instead of swinging the boom, which would be impracticable, when carrying a load, with a narrow tread. The platform is so low that it can be run under the body of an ordinary horse-drawn or motor truck, enabling the crane to pick up loads and lift them off the big truck with facility and celerity.

Steers With All Four Wheels.

In the Elwell-Parker machines, which are manufactured by the Elwell-Parker Electric Co., of Cleveland, Ohio, the driving and steering mechanism presents features of particular interest in that they permit four-wheel steer and, while only two wheels are driven, all four could be driven if it was considered advisable to do so. The company builds a variety of types, but all include the same driving and steering mechanism. Another feature is made of unusually low-hung platforms; the frames are dropped, either between the front and rear wheels, or over a pair of very low rear wheels so that the tail of the truck is not raised. In the high platform trucks, used for baggage and express work where station platforms are lower than the car floors, the wheels are high and the platform is above them. The very practical platform control system, with foot brake normally set, is employed.

The central feature of the driving system is the universal pinion. Final drive is by countershaft, divided by a differential, and universal pinions to internal gears bolted to the rims. The pinions are, to all intents and purposes, universal joints mounted on the ends of the shafts, the outer members taking the form of pinions. The internal gears on the wheels are mounted so that a line drawn through the axis of the steering knuckle pivot will strike the center of the gear teeth and, of course, the center of the pinion, which thus constitutes a universal joint turning on the same center as the steering pivot. The system is the same as that used in that biggest of electric tractors, the Pennsylvania Railroad machine designed by Buckwalter, who also designed the Elwell-Parker drive. A single motor is employed, driving by spur gear to the counter-shaft carrying the dlifferential and universal pinions.

Truck Carries Twice Its Weight.

Though weighing under a ton, the Elwell-Parker freight car truck has a carrying capacity of 2 tons. The battery box is at the driver's end and is raised above the comparatively large front wheels. The flat top of the battery box is available as part to the counter-shaft carrying the differ- high platforms the batteries are underslung.

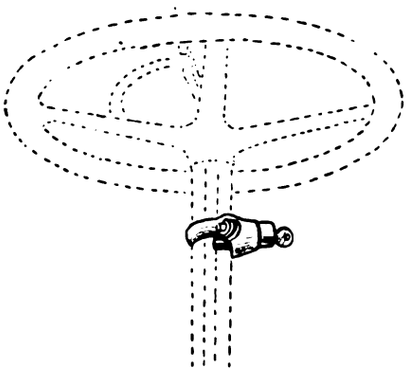
An unusually large variety of models is

Digitized by Google

manufactured by the Automatic Transportation Co., of Buffalo, N. Y., whose machines, by the way, seem to have found especial favor with automobile manufacturers, the Pierce-Arrow, Hudson, Cadillac, Overland, Franklin, Timken-Detroit and other car and part makers being on the list of users. Besides the standard freight truck, there is an extra low freight truck, low and high baggage and express trucks, double-decked baggage and express trucks and three tractor types. The battery is carried in a box on one end of the platform, except where a double battery is employed, when there are two battery boxes, one at each end, or else superposed at one end, according to the requirements. The standard drive is from a single motor through Morse "silent" chain to differential countershaft, and thence by side chains to the rear wheel sprockets. The wheels are 16 inches in diameter and are made up of ribbed cast steel centers with rubber or fabric tires. In the extra low type with wheels under the platform the diameter of the rear wheels is considerably less, but the construction is the same.

Control System That Minimizes Danger.

The control of the vehicle, which is located in the customary way from a little seat platform, includes several features that are out of the ordinary. While the application of the brake automatically cuts off the current, the current cannot again be turned on until the brake is released, so that the possibility of applying both brake and driving power at the same time is eliminated. On the other hand, the cutting off of the current automatically applies the brakes. The motor armature runs on ball bearings—in fact, the truck is ball-bearing throughout, with the exception of the countershaft, which runs on roller bearings.

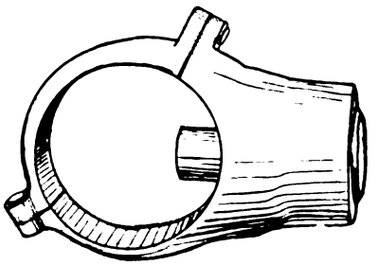


On the tractors, which are designed to haul up to five tons, on trailers, there is a battery box at each end of the platform. In this model the control is arranged as in the other standard trucks—on a little platform leaving the space between the battery boxes available for load carrying. In this case the driver stands between the battery boxes and steers with a wheel on a vertical column.

Old Methods Hinder Progress.

It is a matter of no difficulty to appreciate that the more general use of trucks of the types described is not a little hindered by the fact that most of the concerns who employ them do so in conjunction with the older freight-moving methods which, as in the case of installations of the motor trucks, puts the power machine in an unfavorable position. Rome was not built in a day, however, and it is only reasonable to anticipate the ultimate exodus of the mule and the hand-truck pusher at the end of the procession headed by the truck-horse.

Steering Gear Locked Against Thieves.



One of the peculiarities of the automobile is the fact that there are so many factors that are vital to its operation—that is to say, there are so many things without

NO-RISKO LOCK APPLIED

which the machine cannot run. Ignition, fuel, clutch, gearset, steering gear, all must be operative in order to use the car, and all have been seized upon by manufacturers of locking devices as media for temporarily tying up the machine, the newest device for locking the steering gear being the "No-Risko" steering gear lock, which is shown by the accompanying illustrations and which is made by the C. J. Rogers Mfg. Co. of Philadelphia.

The device consists of a band which encircles the steering column and carries a plunger which enters a hole drilled through the steering column tube and into the shaft;

NO-RISKO STEERING GEAR LOCK

the plunger is held in the locked position by a Corbin lock. To lock the gear it is necessary only to push the plunger into the hole, where it "clicks" in and stays until unlocked with the key. To apply the lock the wheel is turned to the desired position, preferably with wheels at an angle, and the holes drilled. The lock is put on in two halves, with the plunger in the holes; the halves are united by special machine screws which are tightened up until the heads break off, leaving only flush countersunk surfaces which cannot be tampered with.

About that Apperson "Jack Rabbit."

That story about the man who picked up a dog on the grip of his crank handle has been accepted as fact so many times there appears to be no particular reason to doubt the story which just has been dealt out in manifold form by the Apperson publicity man of how the term "Jack Rabbit" comes to be linked with the name of the cars turned out by the Apperson Bros. Automobile Co., of Kokomo, Ind. There may be some dispute as to whether this rabbit story antedates the dog story or vice versa, but in any event the principle is substantially the same.

The story of the rabbit explains why the term "Jack Rabbit" is applied to Apperson cars and why a little metal animal of this species perches upon the radiator of every one of these Kokomo vehicles. Before gasolene cars were as common as they are now a sportsman took an Apperson car to the Dakotas to hunt, carrying guns and fish spears. But one morning the party forgot to put in its reserve supply of ammunition, and when food became scarce it became necessary to get game of some sort, so a spearsman, standing on the running-board, speared rabbits as the car pursued them across the prairie.

When the car returned, someone said "Where'd you get the jack rabbit?" The driver didn't know what was meant until he stepped to the front of the car and saw a "jack rabbit" impaled on the crank handle and frozen stiff. The theory that the car went so much faster than the rabbit that the crank pierced his body is given as the basis for the nickname of the cars. Anyway, it's a good story, but tough on the rabbit.

Misunderstandings About Tire Heating.

While it often is considered a fact that tire heating is due largely to the compression, and consequent heating, of the air due to passing over obstacles in the roads, a little consideration shows that this hardly can be true. It is well known that, while air is heated by compression, it is cooled in an exactly corresponding degree by expansion. Therefore when a tire strikes a bump the air in it is compressed and heated, without doubt; but immediately afterward the air resumes its normal pressure and temperature. It is usually considered that the heating of tires is due to friction between the tire and the road and to the internal friction of the material of which the tire is made. Friction between the shoe and the tube also is responsible for a certain amount of heating.

BRITISH ENGINEERS DECRY CYCLECARS AND STARTERS

(Continued from page 15.)

stances—bores have at the same time been reduced in a great many cases. These small engines start a great deal more easily than do larger ones, of course, and I have heard it said that the better quality of fuel we get also results in easier starting, though I do not think there is anything in this assertion. But whether the fuel is any better or not, I think you will agree that our carburetters are better, for the average American car will not run half as far on a gallon of commercial fuel as will the average British car.

"Complexity" Viewed with Alarm.

"Another reason why starters are not so favorably looked upon is that comparatively few persons in England drive their own cars; nearly every owner has a chauffeur who is also a gardener or a man of all work; in addition to driving the car he also washes it and polishes what brass there is and cares for it generally. And as the owner never has occasion to start the motor himself, it probably never crosses his mind that an engine starter might be a desirable adjunct. Electric lights we have and have had for some time, and to my mind their steadily increasing popularity is doing more to stimulate the demand for starters than is anything else, for it is so easy to combine the functions of electric lighting and starting.

"Still, I think it will be a very long time before engine starters are used at home to the extent they are used in America; there seems to be a prejudice against them because of their apparent complexity; this, too, is unusual in view of the British conception of a simple car, judging by American standards. But no one seems to like the idea of adding wiring and rods and levers and things to a car already pretty replete with them.

Starters Used Mostly American.

"We use quite a few engine starters in England, but most of them are of American manufacture. The Ever Ready spring starter, for instance, is being put on as special equipment by a number of car makers, and in the electrical line we have the Delco, of course, and the Rushmore, these two being the most conspicuous. On the whole, spring starters are preferred to starters of any other kind, because they are simple and light, and as they are put in place outside the hood they do not tend to increase engine complexity to any appreciable extent. After spring starters, pneumatic devices are preferred, I think, though with the increase of electric lighting the compressed air devices bid fair to be ousted."

Turning from engine starters to cyclecars, Prestwick confirmed American suspicions that the so-called British cyclecar boom is more noise than substance. As Prestwick makes small single- and twin-cylinder engines for motorcycles and light cars of the cyclecar variety, he is uncommonly well situated to "speak by the book." He has been so little impressed by the alleged boom, that in conversation with the Motor World man, he said he considered the demand so unstable and limited in its possibilities that he was making no special effort to cater to it.

Cyclecar "Boom" Largely Noise.

"The demand for cyclecars," he added, "appears to be good and to be increasing slightly, but it is almost wholly an assumed demand and as such it seems certain to collapse with dire results to some one in the not far distant future. The principal trouble seems to be that there are no really good cyclecars on the market, with possibly one exception, and that one really is an automobile. The little cars, which logically should be carefully designed and strongly made to withstand the abuse to which they are bound to be subjected are, for the most part, not properly designed and are built of unsuitable materials. As such, they do not appeal strongly to the motorcycle rider who is accustomed to high-class workmanship, and the same holds good for the automobile owner.

"In my opinion, a real demand, though a limited one, is bound to come for the cyclecar people are doing a lot of advertising and are disposing of a lot of cars. It would seem that this is sure to stimulate a real demand, for I can't see how those who purchase the present varieties of cyclecars can be satisfied with them and, being dissatisfied with them, they are nearly certain, if they like them at all, to demand something better; and when they do demand it they will catch us all unprepared. We will be unprepared because we cannot build cyclecars and build them to sell for the prices the purchaser expects to pay. To do so would require quantity production of the American kind, and this is impossible. Personally, I cannot see how a cyclecar ever can be produced that will compete successfully with the Ford car and with some of the other British light cars that at last are making their appearance. That is the whole story in a nutshell."

Poor Construction a Drawback.

Of the others who vouchsafed opinions on the cyclecar movement, none could let in more light than has been let in by Prestwich; his statements were practically reiterated in most cases, and practically all of the engineers were of the opinion that very few indeed of the cyclecars now on the market are worthy of serious consideration because of their faulty design and poor workmanship, which, it was pointed out, is due almost entirely to the low prices at which they must be sold if they are sold at all. The concensus of opinion was a beautiful paradox to the effect that until something better is produced the cyclecar movement never will amount to anything, and that nothing better can be produced at the price!

H. Massac Buist, a representative of the British press who accompanied the British engineers, held similar views to those expressed by Prestwich on what he styled the "much mixed starter problem."

Makers Apparently on the Fence.

"Just at present," he said, "the manufacturers scarcely know where they are at, to use American language. Some buyers want starters and some would not have them as a gift, for they view their complexity and their added weight with alarm. The result is that car manufacturers are on the fence, so to speak. They hesitate to say anything against starters for fear they may have to retract later, and most of them do not know enough about such devides to recommend them to their customers; hence they fight shy of them as much as possible.

"There seems to be little reason for putting starters on small cars, anyway, unless they are used by doctors, for instance, who make a great many calls and are continually stopping and starting their motors. And on the big cars, the chauffeur always starts the engine.

Value as Accident Preventers Overlooked.

"As a preventive of accidents?" he repeated after the Motor World man, and continued: "That's one thing no one ever seems to think of; they figure that as they don't have to start their engines 'they should worry' to use your own expression; but they do not figure that even if the chauffeur should break his arm they are still liable in a way, for no one is going to be inhuman enough to discharge a man who cannot work because of an accident; hence they keep him on in his disabled condition and he is a dead loss until he is again able to do his work. As for themselves, they never seem to think that some day a motor may stall in the centre of a grade crossing with a train bearing down upon them and no chance in the world to get out of the way; such accidents have been few during the past year or so, which probably accounts for the little attention paid to the value of engine starters under the circumstances."

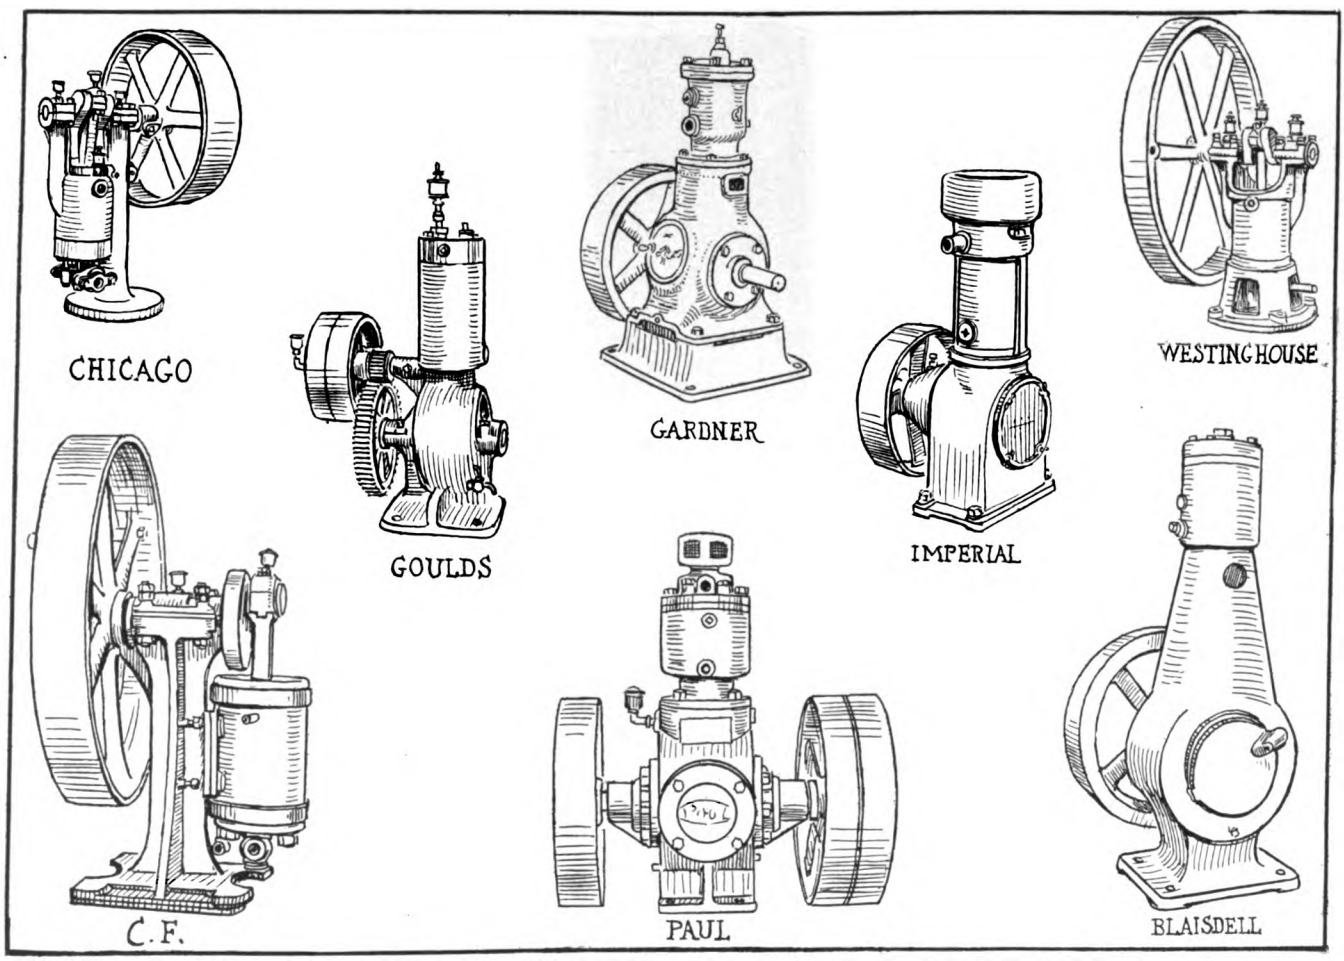
GARAGE COMPRESSORS FOR CONTINUOUS SERVICE

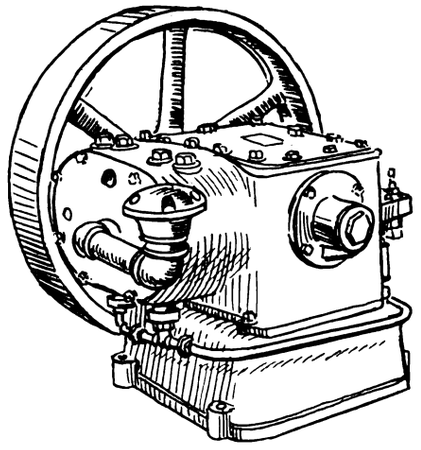


Conditions Which Necessitate the Use of Water-Cooled Cylinders and How They Have Been Met by Manufacturers—Functions of the Automatic Unloading Device Made Plain—Wherein Different Pumps Differ.

If Billy Rea, whose story was told in Motor World last week, had owned a considerably larger garage, he probably would have chosen a water-cooled air compressor to do the work for which he purchased his air-cooled pump. As it is, his one-cylinder air-cooled compressor is plenty large enough for his needs; it supplies all the air he can use and he is particularly proud of it because it never gives him any trouble. It has been running now, off and on, for several months and he has not had so much as to put a wrench to it.

The service is intermittent, as already has been told; the pump is started in the morning and a storage tank filled and one filling generally suffices till noon, when the pump is again connected and the tank refilled. At night, just before the shop is shut down, the pump is again started up, and it never has been found necessary to start it again until the following morning; the air in the tank suffices for night service.

It is not unlikely that if Rea attempted to run his compressor continuously, which would be necessary if the demand for air were considerably greater than it is, serious consequences would follow; it might overheat to the point where its piston would "freeze" in the cylinder, and it is altogether likely that the lubricating oil would be burned up in comparatively short order. The pump was not designed for continuous service; it was designed to be used just the way Rea uses it, which is exactly the reason he gets so much satisfaction out of it. Most air-cooled pumps will run upward of 15 hours without overheating and some of them are designed to run continually, though in this case the pressure obtained seldom reaches 100 pounds to the square inch.

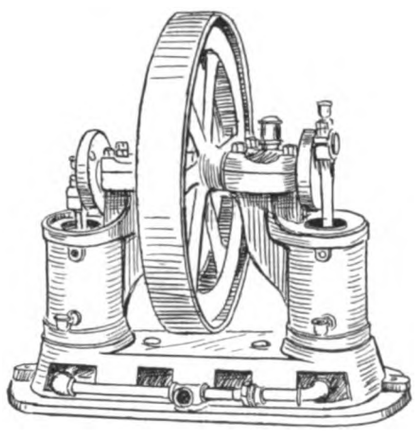


Where a pump is to be used continuously, however, and higher pressures are required, it is the better part of wisdom to rely on water cooling; most manufacturers produce both types, and few recommend air cooling for other than intermittent service

EIGHT TYPES OF WATER-COOLED COMPRESSORS SUITABLE FOR THE AVERAGE GARAGE

Digitized by Google

or low pressure if the pump is to be run without periodic rests to permit it to cool. Water cooling has the advantage that the compressor may be run continuously at maximum capacity without danger of impairing its efficiency; and the water-cooled air compressor is no more complicated than is the water-cooled automobile motor. In fact, it may be a great deal simpler for there is no necessity for a radiator or a pump, and the place of the former being taken by a strong galvanized iron tank, and the place of the latter being taken by thermo-siphonic action. It is possible, of course, to pipe the water into the jacket from the supply main and permit it to drain away into the sewer, thus further simplifying matters. This method is expensive, however, and should not be resorted to except in case of dire need and lack of space for a water tank. In some cases, compressors are made with water reservoirs integral with their cylinders when



NATIONAL ENCLOSED TYPE

neither tank nor running water is necessary, of course.

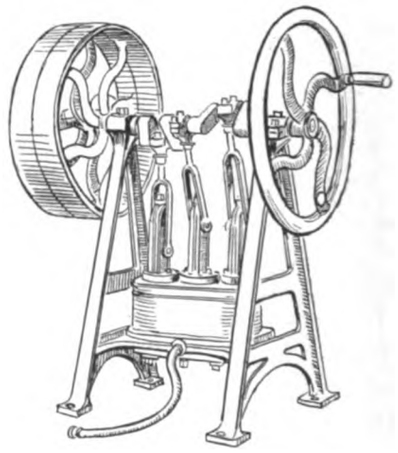
Reservoir Contained in Cylinder Head.

The Imperial compressor, produced by the Ingersoll-Rand Co., of New York City, for instance, is of the latter type, the whole top of the cylinder head being a water reservoir which communicates with the cylinder jacket by means of ports, thus providing a very efficient circulation of water by thermo-siphonic action; under ordinary service conditions, which can be taken to mean that the compressor is run at a pressure of not to exceed 100 pounds continuously, or at 200 pounds pressure intermittently, one filling of the reservoir generally will suffice for a whole day. The cylinder measures 4½ x 5 and the capacity is 14.9 to 23 cubic feet of free air a minute at 325 to 500 revolutions. Lubrication is carried on automatically by splash.

With both the Paul compressor, produced by the Fort Wayne Engineering & Mfg. Co., of Fort Wayne, Ind., and the Gardner compressor, which is made by the Gardner Governor Co., of Quincy, Ill., either a reservoir or running water must be used, the water being piped into the bottom of the cylinder jacket and out the top in the usual manner. One important difference between these two pumps is that whereas the Paul has a poppet suction valve and a ring type exhaust valve, the Gardner has as an intake valve a port in the cylinder uncovered by the piston. Another important difference is that the Paul is lubricated with oil on the splash system, a separator being used to prevent oil be-

JACOBSON TWIN CYLINDERS

ing pumped into the tires or the tank, and the Gardner is lubricated throughout with grease which is contained in hollow connecting rods. Both pumps are made in several sizes and neither requires a great deal of floor space.



Keeping Out Garage Dust and Dirt.

The Blaisdell compressor, which is made by the Blaisdell Machinery Co., of Bradford, Pa., is distinctive in that it is perhaps more fully enclosed than are any of the others, and for this reason it should prove particularly suitable for use where necessity places it in a position exposed to considerable dust and dirt. Lubrication is completely automatic and the pump can be run continuously at from 250 to 400 revolutions a minute without fear of dangerous overheating; the pressure capacity is 250 pounds to the square inch; the weight complete is 150 pounds.

The name Westinghouse always has been connected with pneumatics, of course, and the little single-cylinder air compressor that is illustrated herewith is made with all the care and precision that marks other Westinghouse products. As may be seen by the picture the compressor virtually stands on its cylinder, which is continued upward to form the bearings for the crankshaft. Both inlet and exhaust valves are made of hard brass and are contained in the cylinder head, which is at the bottom. At 250 revolutions a minute—the cylinder dimensions are 3 x 4 bore and stroke, respectively—and working against 180 pounds pressure, which is maximum efficiency, approximately one horsepower is required to drive it. The maximum capacity is 4.1 cubic feet of air a minute at from 180 to 250 pounds pressure. The Chicago Pneumatic Tool Co.'s compressor is somewhat similar to the Westinghouse in the arrangement of its parts and is made in several sizes varying in capacity 6 to 15 cubic feet of free air a minute.

Accessibility of Valves a Feature.

The Carruthers-Fithian compressor, built by the Bessemer Gas Engine Co., of Grove City, Pa., like the Chicago Pneumatic Tool Co.'s, has its valves in a very accessible location, and their removal for regrinding or replacement does not necessitate the breaking of air connections. It is made in

GLEASON-PETERS PUMP

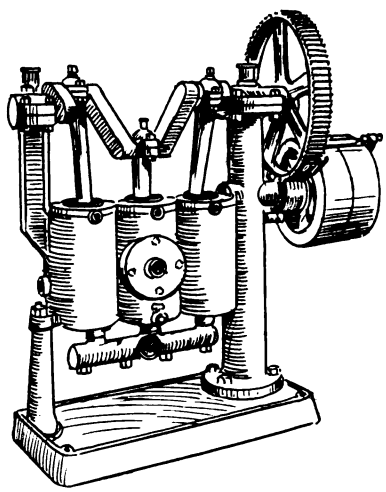
two types—3 x 4 inch bore and stroke—one having one cylinder, the capacity being three cubic feet of free air a minute, and the other having two cylinders and double the capacity; both are designed for 150 pounds to the square inch working pressure.

For comparatively small capacity—a little over three cubic feet of free air a minute at 150 revolutions—and high pressure suitable for operating compressed air tools and for engine starting, the Goulds Mfg. Co., of Seneca Falls, N. Y., has developed the back geared pump shown by the accompanying illustration; it is water-cooled and is designed for continuous service at 150 pounds pressure. For this reason the construction is very rugged and clearance has been reduced to the minimum; both valves are steel and are located in an accessible position in the cylinder head.

As is the case with air-cooled pumps, greater capacity requires one of two things: Either the pump must be run at greater

Digitized by Google

speed or a pump having more than one cylinder must be used. The speed at which a compressor can be run is limited and in no case should the recommendations of the manufacturer be exceeded. It is possible, of course, to increase capacity temporarily by speeding up the pump, but the practice should be avoided. For continued greater capacity the logical means to adopt is to install a larger pump and where floor space is limited and a practically constant stream of air is necessary, nothing remains but to use a multi-cylinder pump. With a large size single-cylinder compressor, it will be understood, the speed of operation must be reduced proportionately, and as there then exists a greater interval between the intake and compression strokes of the piston considerable intermittency will follow, though this more or less objectionable feature can be overcome by the addition of a storage tank of small capacity.



Advantages of Multiple Cylinders.

In the Jacobson compressor, which is illustrated herewith and is produced as one of a complete line by the Jacobson Mch. Mfg. Co., of Warren, Pa., the cylinders are located one on either side of a heavy combined flywheel and driving pulley, and as one cylinder is compressing while the other is on the suction stroke, no wider belt is required to drive the double machine than would be required to drive a single-cylinder machine of the same dimensions; obviously, however, it delivers twice the amount of air. With 3 x 4-inch cylinders, the capacity of the machine at 200 revolutions is 6½ cubic feet of free air a minute and the obtainable pressure is 200 pounds. The weight of the complete plant is 340 pounds. Owing to the limited space between the cylinders, tight and loose pulleys are not supplied.

The National Brake & Electric Co., of Milwaukee, Wis., manufactures air compressors in great variety for nearly every branch of industrial service, and among them the pump shown by the accompanying sketch, is particularly suitable for the medium sized garage where air is used for operating tools and cleaning as well as for inflating tires. As may be seen by the pictures, the whole of the mechanism is completely enclosed, the only exposed part being the heavy flywheel which serves also as the driving pulley. The pump has two cylinders and the capacity ranges, according to dimensions, from 12 to 75 cubic feet of free air a minute. For continuous service, an unloading device is fitted. Its function is to adjust the valves so that when a predetermined pressure is obtained the compressor simply operates idly and no power other than that required to overcome friction, is used to drive it. Immediately the pressure drops below a predetermined limit, the compressing function automatically is taken up again.

Pump That Utilizes Oil Strainers.

The Gleason-Peters Air Pump Co., of 255 Classon avenue, Brooklyn, N. Y., is another company that produces a variety of types of air compressors, the one illustrated being suitable for a large garage and requiring only a very small amount of power to operate—at maximum capacity one-half horsepower is needed. The pump differs from all of the others in that it has three cylinders, for which reason, it is pointed out by the makers, half the power is required to drive it that would be required to drive a single-cylinder pump of the same capacity. The cylinders, base plate and water jackets are all cast integral of gray iron and hence the possibility of leakage is eliminated. Tight and loose pulleys and a flywheel are fitted, and the latter is equipped with a handle to permit the inflation of tires by hand. To prevent the entrance of oil into the tires, where no storage tank is employed, an ingenious and simple type of strainer is used; it consists of a separable shell with wire gauze at both ends and may be inserted anywhere in the air line; it is easily opened to be cleaned and is made of brass.

SPACKE BACK-GEARED PUMP

Triple Cylinders and Back Gearing.

To obviate the necessity for small line shaft pulleys and consequent slippage, the Spacke three-cylinder compressor, produced by the F. W. Spacke Machine Co., of Indianapolis, Ind., is back geared as shown by the accompanying sketch; the smaller pinion is made of fiber to reduce noise to the minimum. The speed of the tight and loose pulley is 600 revolutions a minute and of the pump crankshaft 150 revolutions. The dimensions of the cylinders are 3 inches bore and 5 inches stroke and at rated speed the capacity is 9 cubic feet of free air a minute; the working pressure is 125 pounds; the weight of the machine complete is 260 pounds. For continuous service, an automatic unloading device is regularly fitted and may be set for any pressure from 50 to 150, or more, pounds.

Starter vs. Horn Consumption.

Whether or not manufacturers of motor horns will endorse the figures, the fact remains that the tests recently made in the laboratories of the Disco Co. in Detroit were interesting, for it is stated as a result that the average daily current consumption of a Disco electric starter, attached to a six-cylinder engine, is less than that of a motor horn. It was found that a six-volt current of 5 amperes was required to sound the horn, while the starter took 78 amperes at the same voltage to turn the motor over at 134 revolutions per minute. Figuring on five starts a day and an average of one second per start, and on 50 blasts of the horn per day, at 4 seconds per blast, the starter consumes 1.08 amperes and the horn 2.08 amperes.

About the Universal Joint Boot.

Among the little things on a car that stand a good chance of being neglected are the leather boots strapped over universal joints. Not only are the boots important as dust excluders, but they serve, in some joints, at least, to catch small screws or pins that may get loose. Straps should be kept tight and defective boots replaced.

Doubtful Results from Mixed Fuels.

Experiments with mixtures of benzole and kerosene as fuel indicate that some little trouble is likely to arise from the partial separation of the two liquids after standing over night. The kerosene goes to the bottom and makes starting a difficult matter. While on the road vibration keeps the fuels well mixed.

Sharpening Chisels on Oil-Stones.

Sharpening a cold chisel on an oil-stone may seem an unnecessary refinement, but it is not infrequently done by mechanics who have a great deal of chipping to do. The claim is that the edges are better and considerably more lasting than if used just as they come from the grindstone.

To Distinguish Iron from Steel.

A piece of tool steel can be distinguished from a piece of iron by its peculiar sharp ring when struck with a piece of metal. If the sounds produced by striking a cold chisel, for instance, and a piece of ordinary iron are compared they will not readily be forgotten.

1,042,698. Electrically Propelled Vehicle. Harry Ward Leonard, Bronxville, N. Y. Original application filed Mar. 2, 1903, Serial No. 145,686. Renewed May 26, 1908, Serial No. 435,119. Divided and this application filed Apr. 13, 1908. Serial No. 426,638. (Current control for electric vehicles.) 41 claims.

1,042,712. Rotary Valve for Engines and the Like. Albert E. Moorhead, Chicago, Ill., assignor, by mesne assignments, to American Rotary Valve Company, Chicago, Ill., a Corporation of Illinois. Filed July 28, 1911. Serial No. 640,966. (Motor with rotary valve over cylinder heads.) 19 claims.

1,042,714. Driving Mechanism for Traction Engines. Walter S. Morton, Portsmouth, Ohio, assignor to Samuel F. Dunkle, trustee, Harrisburg, Pa. Filed Oct. 10, 1911. Serial No. 653,915. (Chain drive for traction engines.) 6 claims.

1,042,722. Antiskidding Device. Turner W. Simmons, Bridgeport, Conn., assignor of one-sixth to William C. Bowers, Bridgeport, Conn. Filed Nov. 24, 1911. Serial No. 662,146. (Non-skid chains with rubber-covered balls.) 5 claims.

1,042,740. Igniting System for the Engines of Automobiles. James G. Winsor, Detroit, Mich. Filed Aug. 7, 1911. Serial No. 642,591. (Circuit adjuster for ignition systems.) 5 claims.

1,042,814. Circuit breaker for Electric Ignition Devices. Arthur R. Mosler, New York, N. Y., assignor to A. R. Mosler & Co., New York, N. Y., a Corporation of New York. Filed Jan. 15, 1906. Serial No. 296,230. (Rotary timer with eccentric action.) 2 claims.

1,042,818. Spark Plug. Albert J. Parchem, Lancaster, Pa., assignor of one-half to William F. Lebzelter and one-half to John J. Thompson, Lancaster, Pa. Filed Jan. 25, 1910. Serial No. 540,045. Renewed Sept. 18, 1911. Serial No. 649,819. (Spark plug with loose ball in lower end.) 6 claims.

1,042,875. Lock for Vehicles. Ephraim M. Bishop, Kingston, N. Y. Filed July 10, 1912. Serial No. 708,633. (Lock and chain mechanism for connecting front and rear wheels.) 1 claim.

1,042,888. Hydrocarbon Engine. Alphonse Butsch, St. Lucia, British West Indies. Filed Oct. 29, 1910. Serial No. 589,783. (Two-cycle motor lubricating system.) 2 claims.

1,042,925. Windshield for Automobiles. John L. Kennedy, Washington, D. C. Filed Oct. 6, 1910. Serial No. 585,710. (V-shaped windshield with upward hinged extensions.) 4 claims.

1,042,975. Internal Combustion Engine. John M. Sailer, Janesville, Wis., assignor of one-half to William Musser, Iowa City, Iowa. Filed May 10, 1910. Serial No. 560,403. (Motor with separate pumping cylinders.) 11 claims.

Holds World's Stock Championship

Fastest Stock Mile

National

Holds World's Record for Fastest 500 Miles in Competition

Our Answer

Uncharitable rumors, prompted by either malice or ignorance, have charged the National Motor Vehicle Company of Indianapolis with unfairness and unsportsmanlike conduct during the recent 500-mile race.

These defamatory insinuations, all the more vicious because not definite nor in the open, include:

That the *National* people conserved the speed of the winning car to keep it from breaking the *National's* record.

That the *National* people did work in their factories prior to the race, for the foreigners as against the Americans.

That the *National* employees bet heavily on Goux and therefore worked to have him win.

If anyone could have done the impossible, and held Goux back, it still does not explain why some of the other drivers did not get in front, win the race and break the *National's* record.

M. Goux had a safe lead. It is conceded that he did not have to struggle as hard to keep first place as others did to keep secondary positions.

Any attempt to besmirch the *National's* reputation only magnifies its marvelous performance and emphasizes how easy it was for Goux to win and how others failed to surpass the record of either Goux or the *National*.

It is true that the National Company helped the Peugeot team. *That* is sportsmanship. If we had refused, we should have been censored even more severely. It is equally true that the National Company also helped *seven other teams*, both foreign and American, without favoritism. We simply extended the courtesies naturally expected from a resident to a visitor.

At the beginning of practice for the race the National Company offered its services to any and all competitors. This, too, in the face of the fact that every bit of assistance rendered by the National Company to a contender made it all the more possible for these contenders to break the *National's* record.

The National Company tried to be fair, and was fair.

Frequently in the past the National Company has helped competitors in races where *National* cars were entered. The National Company believes in helping the cause of good, clean sport and building it up. In helping cars this year the National Company lived up to its lifelong policy.

Our racing competitors in years past who know our attitude and who know how scrupulously we adhere to the rules of fair play only laugh at these charges. They know how empty and unjustified they are.

To the man who is familiar with racing and with the management of such clean sportsmanship events as the 500-mile race the insinuations direct and indirect against the National Company are both ridiculous and shamefully indicative of ignorance.

The greatest of all reasons why these charges are untrue is the unimpeachable and honestly won reputation of the National Company.

The National Company considers it a rare tribute when foreigners seek its advice and assistance in a matter so important as this race. We also consider it an honor that Americans came to us. We will extend the same assistance again under the same circumstances.

William Faroux, the Peugeot consulting engineer, in a signed article in Motor Age, explains the whole situation. He gives credit where it is due, praises Americans for clean sportsmanship, admits the *National's* record is one worthy to attempt to lower and equally hard to achieve.

The only way the *National* is "to blame" for the record not being lowered is that it made the record. In so doing it gave the world a criterion for speed, power, reliability and stamina.

At no time during the race was the *National's* record reached by any car.

***National*, 78.72 miles per hour (1912 winner)**

1913 winner, 75.92 miles per hour

1911 winner, 74.61 miles per hour

PATHFINDER TOURING CAR

40 horse power *120 inch wheelbase*

1914 New Pathfinder Models ready for delivery NOW 1914

¶ The phenominal sales record made by the Pathfinder "40" during the first five months in 1913 makes it possible for us to offer you 1914 models RIGHT NOW.

¶ This is not an announcement of new models for early delivery but means that we can actually *deliver* your cars *upon receipt of your order.*

¶ Pathfinder sales show an increase of 117% this season over a corresponding period of last year, because Pathfinder cars have gained a reputation for reliability that has been spread broadcast by present Pathfinder owners.

DEALERS:—Realize This Advantage

¶ You know how hard it is to sell old models against the new.

¶ You know how much competition will be eliminated by actual ability to deliver 1914 models at once.

¶ This is the exact position we are in today, due to the sales momentum created by Pathfinder cars already in use.

¶ This opportunity may come but once in a lifetime. Tell us what territory you can cover. We want you with us--act quickly as every minute counts.

THE LONG HORN

WHAT THE LONG HORN SELLING AGENCY MEANS TO THE DEALER

WHILE THE VARIOUS TYPES OF LONG HORN WARNING SIGNALS have their largest demand from pleasure car owners, it is of interest to note that owners of any type of self-propelled Vehicle or Motor Boat or Motorcycle, find in the LONG HORN the ideal Warning Signal for all purposes.

THIS ALL AROUND SIGNAL, hand actuated and mechanically operated, supplying instantly, adequately and unfailingly a deep, sonorous, commanding warning for Pleasure Cars, Commercial Cars, Motor Boats, Motorcycles, Electrics and Steamers alike.

IT IS THE ONLY DEPENDABLE WARNING SIGNAL with adequate volume and intensity that may be applied to Motor Car, Motor Boat or Motorcycle in a few minutes' time and at no installation expense.

OUR DEALERS EVERYWHERE are enjoying liberal profits, every sale is a downright pleasure and every owner your friend. NOTHING TO GET OUT OF ORDER, no item of upkeep, no possibility of losing a warning signal sale if you have a LONG HORN stock.

A SPECIAL MODEL FOR EVERY CAR, BOAT or MOTORCYCLE

PRICES, $10 to $19

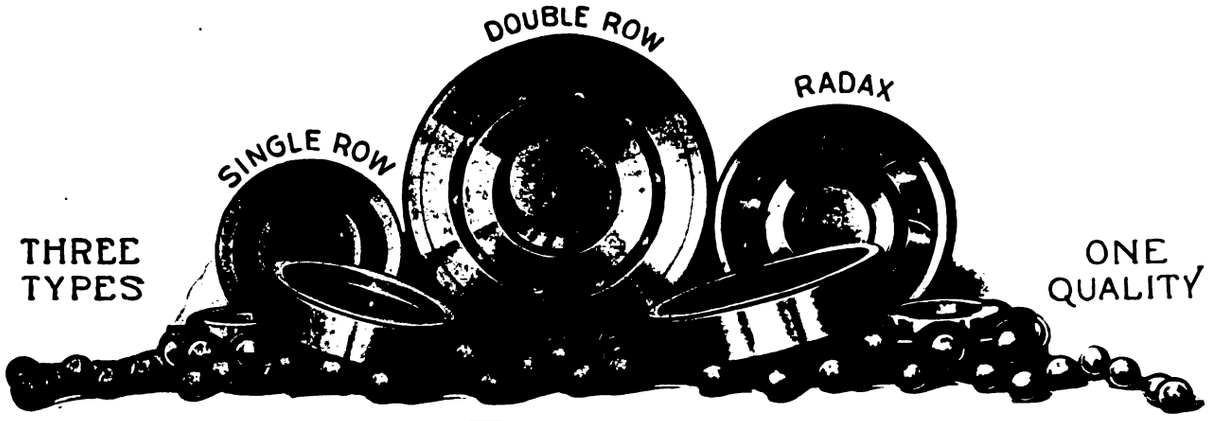
SIMPLEX

Exceptional Agency Opportunity

The completion of the new factory of the Simplex Automobile Company at New Brunswick, N. J., increases the production of Simplex Cars to the point where an expansion of selling territory is possible.

Few Simplex agencies have been established in the past because the limited output would not allow a large enough allotment to make the proposition a paying one.



We are now ready to close agency arrangements in desirable territory for the popular Simplex Cars. The line includes the shaft-driven 38 H.P. chassis and the enclosed chain-driven 50 H. P. chassis, both of which are mounted with luxurious, smart bodies of exclusive design, following the latest European lines. Inquiries concerning an agency will receive prompt attention.

AMERICAN MADE FOR AMERICAN TRADE

NEW DEPARTURE

BALL BEARINGS OF DISTINCTION

THE motor car manufacturer is constantly seeking to put into his car that which will quickly sell it.

The fact that eighty per cent. of the American-made motor cars sold this year are equipped with New Departure ball bearings at once proves the superior quality, efficiency, and service of this bearing, and gives it distinction.

The ball type of bearing is conceded to be a more thorough eliminator of friction than any other type. This means that engine energy is conserved to the utmost, economizing fuel, repair, lubrication, and maintenance cost.

The car which was driven on Long Island, June 20, by S. G. Averell, the well-known automobile and efficiency engineer, for a distance of 86.6 miles on a gallon of gasoline, was mounted on ball bearings.

The purchaser of an automobile in which New Departure ball bearings are used knows that the designer and manufacturer have selected a bearing equipment that is the highest embodiment of correct principles of mechanics and skilled workmanship, worked out in materials guaranteed for strength and durability.

Send for instructive literature.

The Biggest Motor Truck Order Ever Placed

80 Alcos for the U. S. Mail—A $225,000 Sale

THE Postal Transfer Service, Inc. has just placed the largest order for motor trucks on record—an order for 80 Alco trucks to haul U. S. mail—a sale approximating $225,000.

This marks the greatest tribute ever paid to any motor truck. For the contract was awarded to the Alco over leading makes of motor trucks, gasoline and electric, after exacting tests by Government inspectors.

Consider for a moment these facts:

These 80 Alco trucks in a year will be required to cover 1,000,000 miles; to haul 1,550,000 tons—157,680,000 cubic feet—of United States postal matter. End against end, this fleet of 80 Alco trucks extends 1810 feet—a quarter of a mile.

Great are the proportions of these figures. But more important is the nature of the service. It is day in and day out, running on railroad schedule, making trains, operating nights as well as days—24 hours a day at times—over all sorts of roads, in the sizzling heat of summer, in the winter blizzards—*and always the necessity of clocklike regularity.*

None but a superior truck could qualify for tasks such as these.

The Alco truck is no experiment in this type of service—it has been proven in the service of express companies. The American Express Company has 86, the Long Island Express 20 and so on.

And no type of duty is more severe than express service.

Further, it is only natural that the verdict should fall to a product of the American Locomotive Company. 51,000 of its locomotives have hauled you, your families, the things you eat and things you wear—safely and on time; in high altitudes; in low altitudes; and in many latitudes.

This is going to be a hot summer. It will cause many millions of dollars loss in horse flesh. Better anticipate by looking into Alco trucks for your business.

Catalog will be sent on request.

Get In Before The Gate Closes

The day after we made our first announcement of the fact that we were ready to assign territory on the phenomenal new Wahl Car, we received 147 telegrams, besides a flood of letters from dealers in every part of the country, applying for territory.

This we regard as a very natural result of such astonishing value as we offer in the Wahl Car. Experienced automobile men know that such a car as we are building will be snapped up by the public in very short order. It represents exactly what so many people are looking for—a real automobile, rich in appearance, modern in design, complete and high-grade in equipment, at a price hitherto considered impossible.

Here is the point for you, Mr. Dealer. It will take but a little more time to get all the dealers we can possibly supply for 1914. 5,000 cars will be our limit for this coming season. We would like to make more, and take care of everybody, but our facilities are limited. Our advice to you is to wire at once, or write if you prefer, and get your territory secured.

August Delivery---Three Year Contracts

Cars are beginning to come through the factory now. Soon they will be coming faster, and we will be able to promise all our dealers first shipments some time in August.

Here is another way in which we protect our dealers' interests. We allow you to make a three-year contract. Do you realize what that means? It means that after your first successful season, when you have worked up a nice business in your locality, it will **not** be taken from you and given to some one else. You get the benefit of your labors when you handle the Wahl Car.

Here Are the Real Facts About the Wahl Car

Never in the history of the automobile industry has so much value been given for such little money. Here at last is the realization of the prophecy that has been made for years that "some time someone would build a real motor car at a price within the reach of the poor man." Here is a car that will please the rich man, at a price that everybody can afford.

MOTOR. Four Cylinders, L head, cast in pairs; cylinders, 3¼ in. bore, 5½ in. stroke. Silent, efficient and flexible. Crankshaft of drop forged high carbon steel, valves fully enclosed.

UNIT POWER PLANT. The Motor, Clutch and Transmission are built and assembled in one unit.

CLUTCH. Nine-inch disc-type Clutch with Raybestos-lined discs. Quick, easy engagement without grabbing.

TRANSMISSION. Sliding selective type, four speeds—three forward and one reverse—quiet, smooth-running; equipped with annular bearings. Transmission and Clutch readily accessible and adjustable.

IGNITION. High-tension Bosch Magneto, set spark. Simplest and most efficient Ignition at all speeds for the expert and the novice.

STEERING. Full worm-and-gear type, Irreversible, with 17-inch Steering Wheel.

REAR AXLE. Semi-floating Salisbury with Hyatt roller bearings. Bevel Drive and pinion of extra large size and strength with ingeniously designed housing of great strength and light weight.

FRONT AXLE. "I" Beam Section drop-forging, drop-forged steering arms and knuckles with large drop-forged spindle.

BODY. Aluminoid steel, wood rim, flush sides, full vestibule, full doors, ample room in tonneau of touring car for three people of generous size, luxurious wide seats, with resilient, deep-buffed leather cushion.

GASOLINE TANK. 15 gallon capacity. Oil reservoir 1½ gallon capacity.

CONTROL. Center control; Cane lever gear-shift, with short travel in center, with Emergency Brake lever adjacent, Right-hand steer, Clutch Pedal left, Service Brake Pedal right, Foot accelerator between them, Throttle lever above steering column.

COLOR. Blue-black. Nickel Trimmings.

COOLING SYSTEM. Thermo-Syphon system, large Mercedes radiator, V type, with excess circulation, in conjunction with belt driven fan.

LUBRICATION. Constant level and force feed by pump located on the motor, furnishing continuous spray to all moving parts of the motor. Sight feed on the dash for each of the three main bearings.

CARBURETOR. Holley Model H, with hot air intake and special Holley Carburetor Air Adjustment on the dash to facilitate starting

BRAKES. Two external contracting, two internal expanding, acting on 12-inch drums on rear wheels. Service Brake operated by foot pedal, quick acting Emergency Brake Lever at side of gear shift lever.

RUNNING GEAR AND WHEELS. Wheel base, 106 inches. Wheels, Artillery type, 32 inches, with heavy second growth spokes. Quick Detachable Rims. Tires 32 x 3½ inches, front and rear.

SPRINGS. Front, semi-elliptic; Rear, three-quarter elliptic.

FRAME. Pressed Steel, channel section, dropped, giving low center of gravity and easy riding qualities.

EQUIPMENT. The "WAHL" cars are sold completely equipped, including the following equipment: Mohair Top, Top Envelope and Special Enclosing Curtains, Windshield, Speedometer, Dash Carburetor Adjustment, Prest-O-Lite Tank, Black Enamel and Nickel Gas Headlights, Oil Side and Tail Lamps, Quick Detachable Rims, Tire Irons, Horn, Tire Repair Outfit, Tool Kit, Pump and Jack.

Don't wait until this big chance gets away. Write
or wire today---right now. Every minute counts.

FEPS

"A Giant in Power—a Miser in Fuel"

YOU have no doubt noticed how trifling necessities like the continuous shifting of gears, back firing of the carburetor, frequent replenishing of gasoline, etc., detract from the pleasure of motoring—but have you ever experienced the real comfort resultant from the elimination of these petty annoyances? It is safe to say that you have not, unless you have ridden in a "Feps equipped" car.

The motorist whose car is equipped with the Feps Carburetor really enjoys its use. The unusual power enables him to take any reasonable hill without shifting of gears. The wonderful flexibility and smoothness of the motor insure thorough riding comfort while the mileage increase of from 25 to 50 per cent. eliminates the necessity of frequent stops for fuel. These are but a few of the many features that have made the Feps Carburetor so universally popular in a few months.

If you would really enjoy your car, have it "Feps equipped."

Big Doings for Haynes Dealers

Three new models; greatly increased output; beautified body lines; complete electric control—electric starting, electric lighting, *electric gear shift;* many other new selling points in the car; new selling punch back of the car; new blood in the manufacturing, sales and advertising departments; big advertising campaign to help Haynes dealers

New Opportunity to a Few More Dealers to Handle the Haynes

"There's something doing in Kokomo"—you have doubtless heard this remark passed dozens of times among automobile men, who have been watching the recent developments at the Haynes Automobile Company.

With the same spirit of progress which created the First American Car and has always kept the Haynes in the foremost rank, the Haynes Company has added some top-notch men to an already efficient organization.

The new members of the executive staff were *picked* from the entire field. No one in the automobile business knows better how to build a car as it ought to be built, than Mr. A. G. Seiberling. He has an enviable record of over 25 years in important executive and purchasing positions—over a third of which have been spent in the automobile field. Mr. Seiberling has been acting as factory manager for the Haynes for a number of months back, and now takes up the work as general manager, pledged not only to keep the Haynes *always ahead* in the race, but to make an even greater increase in the output of Haynes cars for 1915. Mr. Seiberling's interest in the Haynes is more than impersonal, for he is a heavy stock holder.

In Mr. Geo. H. Strout, Haynes has a General Sales Manager who needs no introduction to the trade. There is probably no better known or more successful manager of automobile sales. Hundreds of dealers know him personally as a pace-making salesman, service-man, field-man, etc., With such a wonderful car as the Haynes to push, the work of Mr. Strout will be watched with much interest by his many friends. Dealers who wish to secure a part of the 1914 output of the Haynes, should lose no time in communicating with Mr. Strout.

The new Advertising Manager of the Haynes, Mr. Robert Crawford, comes from the Chicago Portland Cement Company. Flattering offers were made to hold Mr. Crawford, but he had definitely decided to enter the automobile business over a year ago. He accepted his present position in preference to other automobile connections, because he *believes* in the Haynes car, and feels he can do his very best work for it—and Mr. Crawford's work has already made Haynes competition take notice. "Watch his smoke."

Elwood Haynes, President

Elwood Haynes started his career of invention at fifteen. After completing courses at Worcester Polytechnic Institute and Johns Hopkins University, he was constantly engaged in scientific work up to 1891, when he conceived the idea of the "horseless carriage." Preparing drawings, he employed two Kokomo machinists to assist in working out his plans. He made his first trip July 4, 1894. The original Haynes car is now an exhibit at Smithsonian Institute, Washington, D. C., and the placard authentically gives full credit to Elwood Haynes as its creator and builder.

The New Haynes Models

by Elwood Haynes

Creator of the First American Gasoline Car

THE new Haynes models demonstrate that our organization will always be ahead of the times—never a back number. We have always paid more attention to making a good car than to achieving a big output. This very fact has created a self-advertised demand which has required a constantly increasing production. The 1914 output will show a good healthy increase over 1913—and a still bigger production is already planned for 1915.

The new cars—both sixes and fours—are so good that I am satisfied with them. I have never been more enthusiastic over new Haynes models than I am over these.

The new cars have the most graceful lines possible, giving the long, sweeping appearance which suggests class and distinction. The lines of the back of the tonneau are especially handsome. The body lines of the sixes and fours are the same. One car is simply larger than the other.

Wonderful new conveniences have been added to the latest Haynes, which, backed by the prestige and reputation it already enjoys, makes it without a doubt the strongest selling proposition in the whole automobile field.

All New Haynes Models Will Be Standard Equipped With the Vulcan Electric Gear Shift

This is the most remarkable advance in automobile equipment that has ever been made. With the electric self-starter and lighting system it completes the electric control of the Haynes—makes it the most up-to-date car in the whole field.

Every modern development, every convenience that makes a car easy to run, pleasant to ride in and economical to finance, you find in the 1914 Haynes.

And back of all the convenience and up-to-dateness, the same sturdy, dependable quality that is keeping those good, old-time Haynes cars still on the road after years of service, will be always found in every car bearing the Haynes name.

We know absolutely the materials that go into every part of the Haynes. The entire car is made at our factory or under our supervision. We know the materials are right and the testing is thorough and dependable.

Digitized by Google

A. G. Seiberling, General Manager

Mr. Seiberling's business experience of over a quarter of a century ideally equips him for his duties as general manager of the Haynes. He knows how to purchase—he knows how to direct. He has held the important position of purchasing agent for such concerns as the Pittsburgh Plate Glass Co., Great Western Plate Glass Co. He organized the Peoria Rubber & Manufacturing Co. in 1896, and engineered a fortunate consolidation with another concern. He comes to the Haynes after ten successful years in the automobile field in important executive capacities.

Epoch-Making Wonder in Auto History—Electric Gear-Shift and Starter

Combined in Standard Equipment on All New Haynes

Driving the latest Haynes car is a simple performance. After setting the spark and throttle levers in proper position, move the ignition switch to the button on the battery side. Push starter button marked "S" and hold down until motor starts. Removing pressure from starter button automatically breaks connection. Next throw ignition switch onto magneto button.

To start, press the low speed button No. 1, until it locks, pushing foot clutch forward to its furthest position. This produces an electrical contact that causes desired shift of gear instantly.

Second, High Gear, Reverse

To go into second gear, press button No. 2, repeating clutch movement. To go into third gear do likewise. To make car go backward when moving forward, bring to stop, then push button marked "R" and operate the clutch.

Driver Can Anticipate Gear Changes

With the electric gear shift, the driver can anticipate or select any gear change desired. For example, if car is going up a steep grade that may necessitate dropping into second gear before top is reached, button No. 2 can be pressed at any time and when car has slackened speed and motor is about to labor, the clutch lever can be pressed, completing connection and instantly throwing gear into second speed.

Arrangement of Gear Shift

The dial or round switch board containing the buttons which operate the gear shift is located at top of steering post. There are seven buttons marked as follows: "N" for neutral, "1," "2" and "3" for low, intermediate and high gears, "R" for reverse. "S" is the starting button, the central, unmarked button operates electric horn.

Changing From One Gear to Another

Pressing button "N" entirely clears the switch-board, but not until driver has thrown out clutch to the limit. By pushing the clutch lever forward to a limited degree, the clutch can be slipped in the usual manner without in any way affecting the gear shift. When clutch has been pushed about half way out, any gear that is being used is brought into neutral position and by pushing the the clutch pedal to the extreme limit, the gear is shifted into any other gear ratio that has been selected.

Perfectly Simple and a Proven Success

The Vulcan Electric Gear Shifting outfit is decidedly simple, both electrically and mechanically. Has been used on a Haynes Six for a long time. Never necessary to shift gears by hand.

Emergency Hand Gear Lever

Is provided the same as a crank is provided for emergency use, with any self starter. Quickly attached, but unlikely to be needed.

The Mechanical Principle of the Vulcan Gear Shift

Is so simple as to be readily understood at once when it is seen at work. We'll be glad to send full particulars to any one desiring them.

Briefly, Solenoid coils or electromagnets are used to make the shift. These are energized by the battery which furnishes current for the electric starter and lights. The amount of current used is so small that it scarcely can be measured. The current is thrown from battery only for fractions of seconds, while gears are being shifted.

Advantages of Electric Gear Shift

Unnecessary to remove hands from wheel.

Driver can always anticipate speed changes before throwing out clutch pedal.

Clutch always disengaged, and gears drawn to neutral mechanically before a shift, rendering it impossible to strip a gear.

Gear changes made with great rapidity.

Frank N. Nutt, Chief Engineer

For ten of his fourteen years with Haynes, Mr. Nutt has been Engineer—first, Assistant then Chief. A born mechanic, at the early age of eight, he was spending his spare hours at his home-made draughting board or in the neighboring machine shop. Naturally he learned the machine trade at the first opportunity—and learned it well—of a painstaking French machinist. Mr. Nutt manufactured bicycles a few years, and has been with Haynes ever since. Mr. Nutt is well known as a driver in automobile contests and has long been identified with the S. A. E.

The Greatest Line-up of Specifications From a Selling Standpoint Ever Offered in Any Car at Any Price

The Haynes Six Cylinder 7 Passenger Touring Car, Model 27

Motor—4¼-inch bore, 5½-inch stroke, L-head Haynes design, cylinders cast in pairs. Enclosed valves.

Cooling—Centrifugal pump and pressed steel fan.

Wheelbase—Model 26, 130 ins.; Model 27, 136 ins.; Model 28, 118 ins.

Ignition—American Simms magneto with patent pole shoe producing hot spark at full retard. Perfect synchronism, greater horsepower and more perfect running motor.

Lubrication—Splash and gravity feed to main bearings and idle gear, also constant feed to oil basins in lower base.

Control—Left hand drive. Vulcan electric gear shift, dispensing with hand lever and enabling driver to shift gears electrically with an instantaneous shift.

Transmission—Selective type, three speeds forward, one reverse. Timken roller bearings.

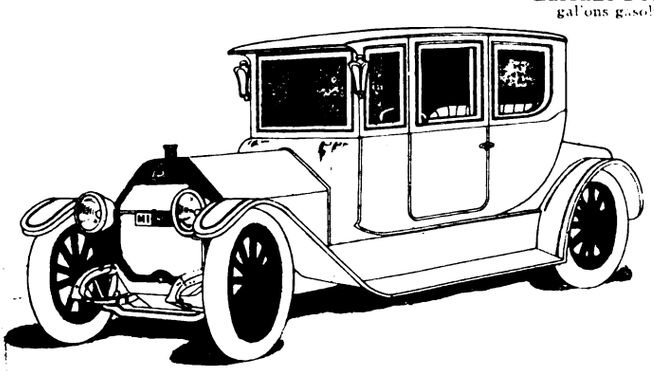
Steering Column—Worm and worm gear type.

Clutch—Haynes contracting steel band on steel drum. Supported by crank shaft. Easily adjustable with single set screw. Applies the power gradually.

Rear Axle—Timken full floating on Models 26 and 27. McCue axles on Model 28 with Gourney bearings.

Front Axle—I-beam, single piece, O. H. steel heat treated. 1½-inch spindles of chrome nickle.

Wheels—Artillery type with Funk demountable rims.



Tires—Model 26, 36x4½ ins.; Model 27, 36x4½ ins.; Model 28, 34x4 ins.

Springs—Front, semi-elliptic. 39⅛ inches long, 2 inches wide; rear 48 inches long, 2 inches wide.

Brakes—Contracting internal, expanding internal. Diameter 15 1-2 external and 15 internal on Models 26 and 27, 12 and 16 on Model 28, both internal.

Finish—Body; Indiana dark blue, black gear and wheels—Pacific Tour gray body, black gear and wheels, optional. All metal equipment, gun metal, black enamel and nickel.

Gasoline Feed Pressure feed. Storage tank holds 20 gallons gasoline. At rear of car where easily filled.

The Haynes Coupe, Model 28

Upholstery—Models 26 and 27, hand buffed leather. Model 28, machine buffed. Cushions deep.

Starting and Lighting—Leece-Neville electrical system. A separate unit system embracing a generator for charging battery and motor for cranking engine. Has proved 100 per cent efficient under all conditions. Exceedingly simple.

Cowl Board Equipment—Electric lights, sight oil feed, automatic cut-out for electric light, auxiliary air pressure pump with gauge, speedometer. Models 26 and 27 have rim wind clock.

Other Standard Equipment—Top, top cover of silk mohair, mechanical tire pump, rain vision ventilating wind shield, Vulcan electric gear shift, two large electric head lights, electric side lights, electric tail light, full cowl board equipment, electric starter, generator, 80 ampere hour storage battery, coat and foot rails, speedometer, electric horn, tire irons, full tool equipment, and one extra demountable rim.

"Wilhelm the First," Factory Manager

Germany has her Kaiser Wilhelm but America has her A. N. Wilhelm, presiding genius at the Haynes factory. You'll find Mr. Wilhelm in overalls. He is literally "on the job," constantly going through the factory, taking in everything with a pair of penetrating steel gray eyes, stopping a man here and there with a pertinent query, always the master of the situation. Mr. Wilhelm is another born mechanic. "Kaiser" Wilhelm as factory superintendent of the Haynes has things moving with a smoothness and a precision that mean mechanical nicety and dependability in the finished cars.

Big Advertising Campaign

THE advantages of owning a Haynes Car will be advertised from now on in magazines, newspapers and farm papers, more aggressively and extensively than ever before.

The opening gun of our advertising campaign will be a two-page spread to appear in the Aug. 2nd issue of the Saturday Evening Post, to be closely followed by advertisements of similar size in Collier's Weekly, Harper's Weekly and big announcements in other magazines, newspapers and farm papers. Later on we will give you a glimpse of some of the great ads we are preparing.

Tens of thousands of dollars will be spent in the newspapers in the cities and towns *where our dealers do business*. We have a most liberal plan for co-operative local advertising campaigns, whereby we share the expense while the direct benefits go straight to the dealer.

Our advertising and sales departments will not only give efficient assistance in locating prospective purchasers, but will furnish dealers with selling suggestions which have been found by wide experience to be the most effective.

Great Book for Prospective Buyers

Written by Elwood Haynes

That Will Put Haynes Dealers in Touch With Thousands Who Are Going to Buy

No book has ever been written about the automobile that will be so valuable and so much wanted as this, written by the man who created the American Motor Car. This book will be offered to motorists in the magazines, farm paper and newspaper advertising. It will locate prospects for our dealer.

The Advertising Department will issue each month a magazine, "The Haynes Pioneer," full of selling punch and topics of live interest to Haynes dealers and owners.

Digitized by Google

Geo. H. Strout, General Sales Manager

As a lad in school and a college student, Mr. Strout was always a leader. Upon entering business his quality of leadership was so quickly apparent that within two years he was made Branch Manager for the Monarch Bicycle at New York. It was a logical step from the wheel to the automobile and in 1903 he formed the Western Automobile Company, St. Paul, and sold it in 1905 at a highly remunerative figure. Since then, in executive selling capacities with automobile concerns, he has become known to every automobile dealer, big and small, from coast to coast.

The Haynes Car is the Strongest Selling Proposition in the Field

There is no car on the market that is so brim full of strong talking points as the Haynes. In previous years, with its fame of being America's First Car, its 20 year record of reliable service, its strength, simplicity, symmetry, surety and satisfaction, it made the strongest kind of a selling proposition. The new models with everything new in equipment including the wonderful Electric Gear Shift, will coin money for Haynes dealers.

It Has a Strong Appeal to Every Member of the Family

Women Fall in Love With the Haynes at First Sight

The long, sweeping, beautiful lines of the new Haynes model compel admiration. The wide doors, the foot deep cushions, the liberal foot room of the tonneau, the roominess of the seats and the smooth-riding qualities of the car, captivate the ladies.

The new limousine and coupe bodies, with the graceful slope of roof and dome, and their exquisite finish, will have no superior.

Women who want to share the exhilaration of driving find the Haynes the car of their dreams. The complete control is centered on top of steering column in a fixed position and entirely operated by electricity. Think of it! Press a button and the starting motor begins to purr—press No. 1 button of the gear shift, and you're off on first speed, with every variation of speed under the absolute control of the finger tips.

Every convenience is found on the dash. There is the rim wind clock, switch for the electric lights, oil sight feed, ignition, automatic cut out for the lights, dash light, speedometer and auxiliary air pressure pump with air gauge.

The regular equipment includes mechanically operated tire pump—really a greater improvement than the self-starter.

The Haynes gasoline supply is pressure-feed. This means that the Haynes climbs grades of any pitch without trouble. Grades that are impossible to gravity feed type cars are easy for the Haynes. The storage tank holds twenty-one gallons of gasoline—three more than the usual size—and is at the rear of the car where it is easily refilled without disturbing occupants. This arrangement also leaves full carrying space under front seat.

Power, Dependability and Economy, Plus the Qualities Before Mentioned Win Men to the Haynes

No man, whether he knows much or little about automobile engines, can fail to be impressed with the power plant of the Haynes. It is L-Head type—the type which most foreign cars now use, and extensively used by many of America's leading manufacturers.

The dependability of the Haynes car is proverbial. The most careful buyer feels safe in buying it. The Haynes is a whole car—a complete car—nothing in it for the sake of novelty—but everything for efficiency and economy.

The amount of gasoline required to run a Haynes, and cost of upkeep are convincing arguments in its favor. We furnish our dealers abundant proofs of this kind.

Robert Crawford, Advertising Manager

Mr. Crawford is best known for his work in the cement industry. First with the Universal Portland Cement Company, then as Advertising manager of the Chicago Portland Cement Company, he won the reputation of getting more publicity for cement in general and for his own company in particular, than anyone else in a similar capacity. Mr. Crawford has achieved a considerable reputation for his exhibits at the Cement Shows and can be depended upon to even better this successful record of the past in his work for Haynes.

The Haynes Has Always Been a Good Money-maker—It Will Be a Money-coiner This Year

The Haynes has been piling up prestige for 20 years. It is always spoken of as a good car. It is a car that people are proud to own and proud to talk about—a car that attracts buyers and is easily sold. Every Haynes owner is enthusiastic over his car and boosting it continually to his friends. Most Haynes owners are friends of previous Haynes owners.

The Haynes for 1914 will be all this and more—in addition it will be the first car to have the wonderful electric gear shift—the first car entirely controlled by electrically operated devices.

Stays Sold—Real Profits

The Haynes is an easy car to sell—economical of salesmen's time. Once sold it stays sold. It is so simply and dependably made that trouble of any kind is almost unknown. The Haynes dealer is not continually pestered by the complaints of disgruntled owners, not driven to distraction by tales of twisted frames, broken springs, self-starters that won't start, engines that balk, and the hundred and one other things that take time and cut down profits.

Our Branches send out letters periodically to their list of Haynes owners in the cities and neighborhoods where they do business, to inquire if everything is all right and offer their service, if any is needed. 176 answered the last letter sent out by our Chicago Branch, and only two needed any service in connection with their car.

No Unkept Promises—Square Deal For All

Haynes dealers are not going to lose money through inability to get promised cars. We are careful not to promise beyond our output, or to take more dealers than we can provide cars for. We know it pays to play fair with our dealers.

Connect Up With Haynes—and You Do Business With a Concern That Is Firmly Established

A connection with Haynes means a permanent possession. The Haynes Automobile Company is a permanent institution. Solidly grounded. Conducted along safe lines. Believes in making a profit each year, not trusting to the future to come out from under tremendous overhead expenses and attain a hazardous success. Hundreds of automobile manufacturers have come and gone during the 20 years that the Haynes has been enjoying its steady, healthy growth. We contend that our policy of natural, steady growth is the safe, profitable way.

Connect up with Haynes, and you will not face the possibility of having to take up the sale of another make of car inside of a year or two, with all that means in the way of lost prestige and effort. Connect up with Haynes and you will be dealing with a concern that has proved itself substantial, and a money-maker—and whose dealers are making money, too.

Many Dealers Prize the Haynes Account as Their Most Valued Asset

The Increased Haynes Output Puts This Prize Within Your Reach—If You Act at Once

If you would like to line up with a car of established reputation, a car that is always spoken of highly, a car whose name as the first car carries with it no little degree of distinction, a car whose owners are boosters and always plugging the game of the Haynes dealer—if you would like to connect up with a manufacturer who believes in playing the game safe, whose credit is good, whose reputation for fair play is well known, whose prospects for the future show every indication of the same steady progress as in the past, who has been in business ever since the automobile business started in America—and will be in business, no doubt, as long as it lasts—if you want to handle a real car, with a real reputation and real selling merit, a car that fairly bristles with strong selling points, that again comes to the front as a pioneer in the use of *the electric gear shift*—here is your chance to get some of the increased output of the Haynes. The opportunity is so good that you had better wire your reservation. At least fill out the coupon, slip it in an envelope and send it under special delivery postage.

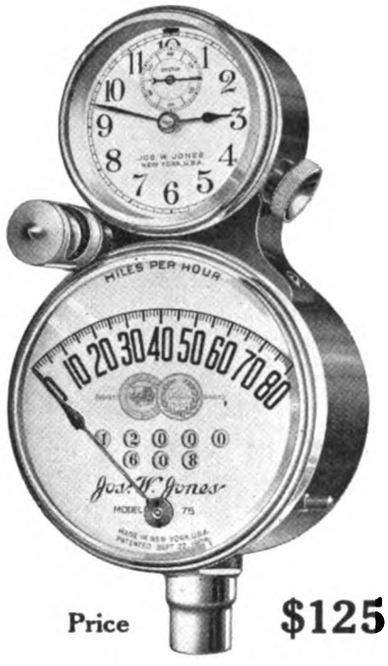
FEDDERS SQUARE TUBE RADIATORS

OUR high reputation as automobile radiator manufacturers was built up primarily on the famous Fedders square tube design. Fedders Square Tube Radiators are standard on many of the highest grade American cars. They have never been equaled for cooling efficiency, freedom from trouble and ease of repair in case of accident.

However, our immense manufacturing facilities enable us to take on contracts for radiators of any design whatsoever. We can handle large or small orders with unusual promptness.



Send us your blue prints and we will tell you just what we can do.

The New York Service Station

Price $125

MODEL 175—Same as model 75, with 3-in. Chelsea 8-day stem-wind and stem-set clock, and electric light.

Price $75

MODEL 75—4¼-inch dial, 80-mile speed scale, with large, equally spaced figures. Low initial speed indication. Large Odometer figures, registering to 100,000 miles and repeat for the season, and 100 miles and repeat for the trip. Tenths of miles shown by red right-hand figures. Instantaneous trip reset. Standard finish—black enamel, nickel rim, Brass Ring Optional. Leather covered casing.

The Guarantee

Behind Every Jones Speedometer

The guarantee behind every Jones instrument is simply, SATISFACTION. That covers every part of the instrument.

Every man who places a Jones on his car is thus assured good service. And back of this guarantee stands Jones Branch Houses and agencies in all of the principal cities of the world.

Able Men in Charge

These branches and agencies are managed by men who have had a wide experience. They are chosen for their ability to handle every transaction to the absolute satisfaction of all who deal with them.

They are experts—men of education. They are gentlemen. And they have the finest speedometer built—to make this cycle of service complete.

Simplicity Is Vital

The New Jones is the simplest speed indicator. It has the fewest parts. It is built of the very best material offered for each purpose. We grind every part where exactness is needed to the one ten-thousandth part of an inch.

Digitized by Google

MODEL 60—4-inch dial, 70-mile speed scale, with large, equally spaced figures. Low initial speed indication. Large Odometer figures, registering to 100,000 miles and repeat for the season, and 100 miles and repeat for the trip. Tenths of miles shown by red right-hand figures. Instantaneous trip reset. Standard finish—black enamel with nickel trim, brass optional. Leather covered casing.

With this simplicity and construction the Jones is the strongest speedometer. The accuracy we obtain in each instrument is thus permanently intrenched.

13-year-old Jones are as accurate now as the day they were placed on their first motor cars. Many today are on their fifth and sixth cars, giving perfect service.

The New Jones will outlast many times over any old Jones ever built.

Motorists Want "Year 'Round" Speedometers

Men are now driving their cars the year 'round instead of merely in Spring and Summer. They want a speedometer that shows the true speed in every temperature. Jones advertising, reaching millions each month, is convincing them that the Jones does show it.

We are explaining in every Jones ad all the advantages—the Steady Hand, that moves or rests without the least vibration—the Immovable Dial and Large Speed Figures, the easiest dial to read—the Correct indication from one mile per hour up to the highest speed each instrument shows—and the ABSOLUTE ACCURACY AT ALL SPEEDS, AT ALL TIMES, REGARDLESS OF TEMPERATURE.

Let Us Send This Man

There's a man in our factory who has every Jones detail at his finger tips. He can answer your every question and give you every fact. He can take a Jones instrument apart and point out exactly and clearly every Jones advantage. He has the Jones Proposition to car manufacturers and the authority to make it conform to your needs.

In sending the coupon for the Jones books and naming a date convenient to you on which you can talk with this representative you are obligating yourself none whatever. Please send it now.

MODEL 360—Same as Model 60, with 3-inch Boston 8-day stem-wind and stem-set clock, and electric light.

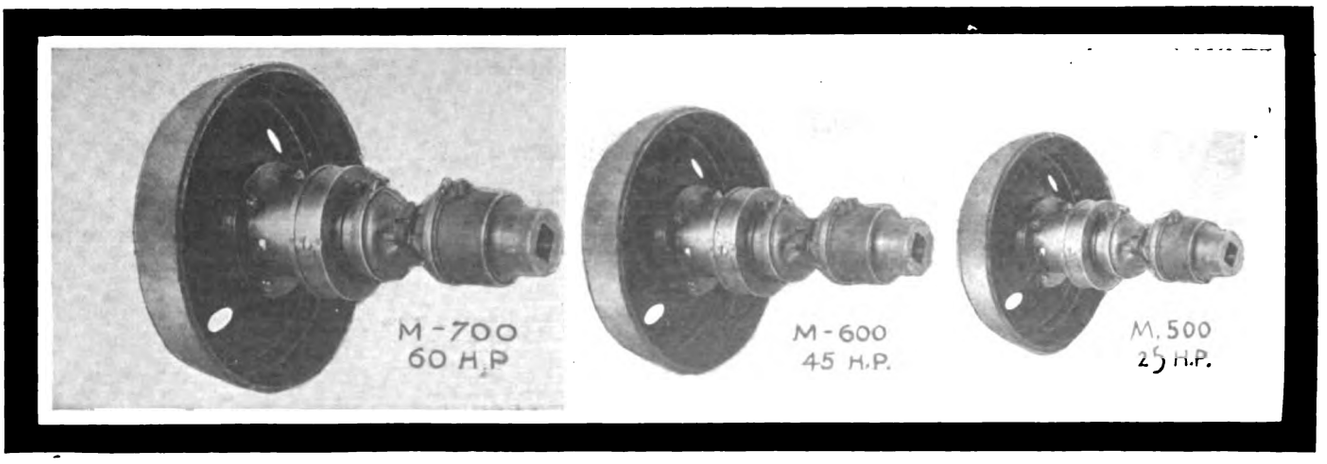
Hartford CONE CLUTCHES

CLUTCH efficiency receives its real test in motor truck practice. The point of application of a truck's motive power to the resistance of its load comes in the clutch. With a heavy load the application of power must be uniform and gradual to overcome the inertia of the load, and then the application of power must be positive so as not to waste any of the motive power.

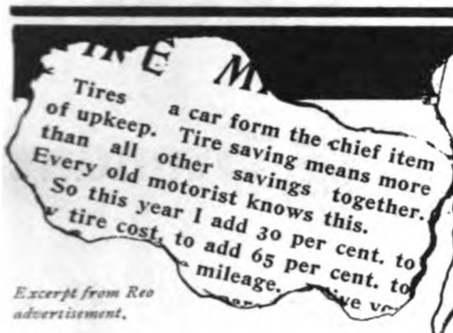
There is also the personal equation to be figured in—the thought and skill of the ordinary truck driver in manipulating the clutch—in governing the application of power to the load.



In making their recommendations to the U. S. War Dept. as to types of parts calculated to give best service, the Society of Automobile Engineers favored the cone clutch.

Hartford Cone Clutches are invariably preferred by truck designers.

They are made of the highest grade materials. Special machinery designed for clutch work insures their accuracy and the closest kind of inspection prevents any but perfect clutches leaving our shops.



Hartford Cone Clutch design provides for accessibility and interchange of parts. Any interchange of parts is so simple that the ordinary driver can take care of it. Any part may be removed for inspection or replacement without disturbing the balance of the assembly. Send blue prints of your motor and chassis with general specifications and let us figure with you on your clutch requirements.

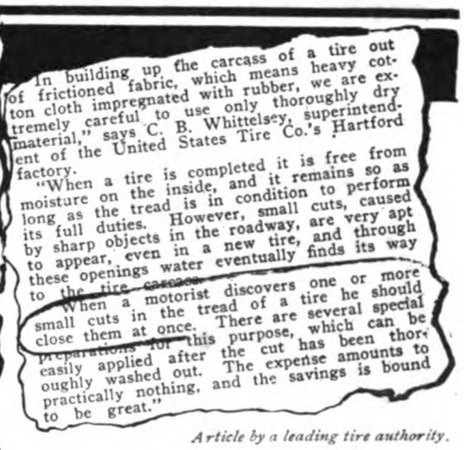
An Ounce of Prevention

Tires a car form the chief item of upkeep. Tire saving means more than all other savings together. Every old motorist knows this. So this year I add 30 per cent. to tire cost, to add 65 per cent. to mileage.

Excerpt from Reo advertisement.

Car manufacturers should feel keenly their obligation to assist in keeping tire costs down. Excessive tire bills have kept many from owning cars.



People would not tolerate a known weakness in any part of the car. They would not, for example, put up with a construction that compelled frequent replacing of a drive shaft. If they had to carry a spare drive shaft, they would condemn the whole car even though a replacement could be made quickly. They expect all mechanical parts to last their natural life.

That is what tires should do. They should last their natural lifetime. They should not blow out before their time.

Users generally have thought that tire trouble and excessive tire expense were inherent in the tires. But they are now getting at the truth.

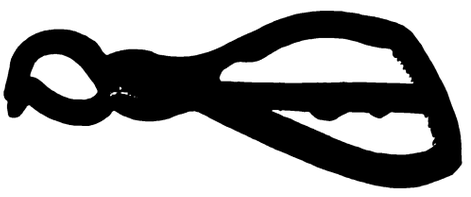
Tire trouble is not only expensive but it is annoying, because it causes delays and interferes with plans. Probably nothing adds more to the enjoyment of motoring than the assurance that the tire service is reliable.

Published interview by H. H. Franklin.

In building up the carcass of a tire out of frictioned fabric, which means heavy cotton cloth impregnated with rubber, we are extremely careful to use only thoroughly dry material," says C. B. Whittelsey, superintendent of the United States Tire Co.'s Hartford factory.

"When a tire is completed it is free from moisture on the inside, and it remains so as long as the tread is in condition to perform its full duties. However, small cuts, caused by sharp objects in the roadway, are very apt to appear, even in a new tire, and through these openings water eventually finds its way to the tire carcass.

"When a motorist discovers one or more small cuts in the tread of a tire he should close them at once. There are several special preparations for this purpose, which can be easily applied after the cut has been thoroughly washed out. The expense amounts to practically nothing, and the savings is bound to be great."



Article by a leading tire authority.

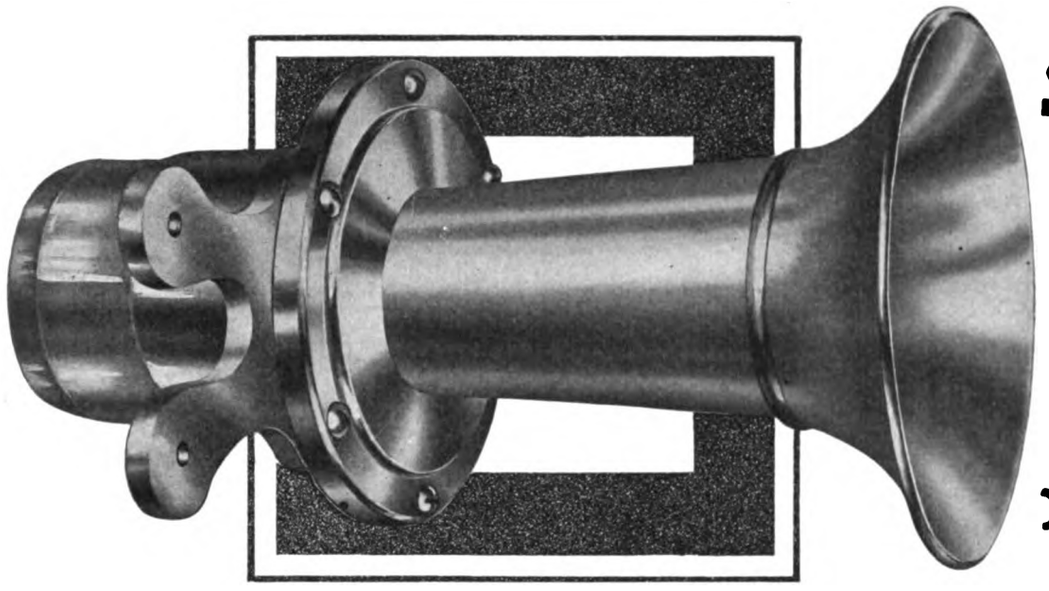
A leading tire expert points out causes of tire trouble, and the cure therefor.

When a tire begins to show wear, when small and apparently insignificant cuts appear it is the time to make the first move toward saving tire costs.

Then is when every motorist should have a pair of Gilmer Tire Repair Pliers. This instrument holds a tire cut open so it can be cleaned and gum put into it. When the Gilmer Pliers are released the wound closes over the gum and heals in a few moments.

Gilmer Pliers are the handiest instruments on the market and should be a part of every car's tool equipment.

Their convenience does away with every incentive to put off the all important attention to small tire repairs.



Write or wire us for quotations on equipment or small lots

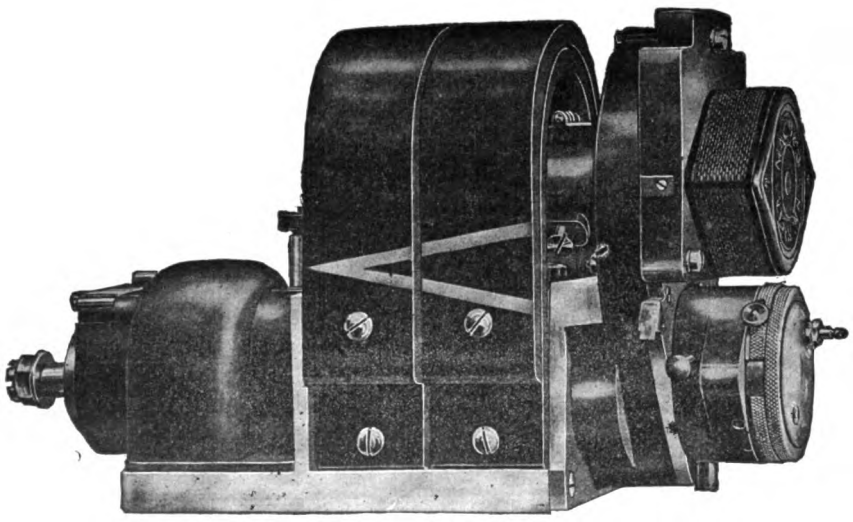
EISEMANN

IF you want concrete evidence of the remarkable dependability of Eisemann Ignition communicate with any one of the 39 leading truck manufacturers in the United States who are using Eisemann Ignition on their product. (We will send you their names if you wish.)

All told, 64 car makers are using Eisemann Ignition almost exclusively, and of these 64, 39, as mentioned above, are truck makers. In other words, under the severest conditions of "make-good-service" Eisemann dominates the field—for you know that in a commercial proposition such as motor trucks—merit, efficiency and dependability alone count.



Eisemann Ignition can be adapted to any requirements. Let us demonstrate our superiority by actual test.

Gentlemen:-

You will be glad to learn that I have just sold my last seven-passenger six-cylinder 50 H.P. car, which makes thirty-six cars of this model I have sold this season, and as I have just learned that you will probably be sold out of this model within the next ten days, beg to say:-

Please enter my order for eight additional cars, two to be shipped immediately, four July 1st and two July 10th; if there is any question as to your being unable to make shipment after July 1st, ship me the entire eight immediately, making four shipments—two cars each two days apart—and I will arrange to lift drafts accordingly.

You will be glad to learn that in all my experience selling cars, I have never found one with which I have had so much success or one which affords the customer so much pleasure and general satisfaction. Your six-cylinder motor is undoubtedly the best ever put under a hood and this, together with the full-floating axle, Gray & Davis Starter, Warner Speedometer and all the other improvements incorporated in your present model, has indeed made it a remarkable value and one that has "made a hit" with everyone who has had an opportunity to ride in it, and I want you to know that I am glad to learn that you are going to continue this model next year and you can rest assured that I shall have no trouble in placing at least seventy-five of them in Brooklyn.

Please let me hear from you immediately in regard to the above-mentioned shipments as I do not want to be caught without any cars.

Very truly yours,

TANNER MOTOR CAR COMPANY.

Louis Burstein

Play safe by arranging for deliveries of the small parts you are going to use ***before you actually need them.***

We are now making several hundred thousand parts daily for the Summer and early Fall requirements of manufacturers of automobiles and automobile accessories; we can give you very good service right now on practically every type of duplicate screw machine parts in brass, steel and iron, up to 2 1-4 inch diameter.

Our screw making equipment has been increased to handle a million parts a day. This increase plus the experience gained from fifteen years of learning how to produce and handle screw machine work rapidly, means early deliveries and parts that are really duplicates of your models and specifications.

Play safe by ordering now and avoid the chance of being held up on your Fall and Winter plans. Prompt estimates and delivery date will be made on samples and specifications mailed direct to our Quotation Department.

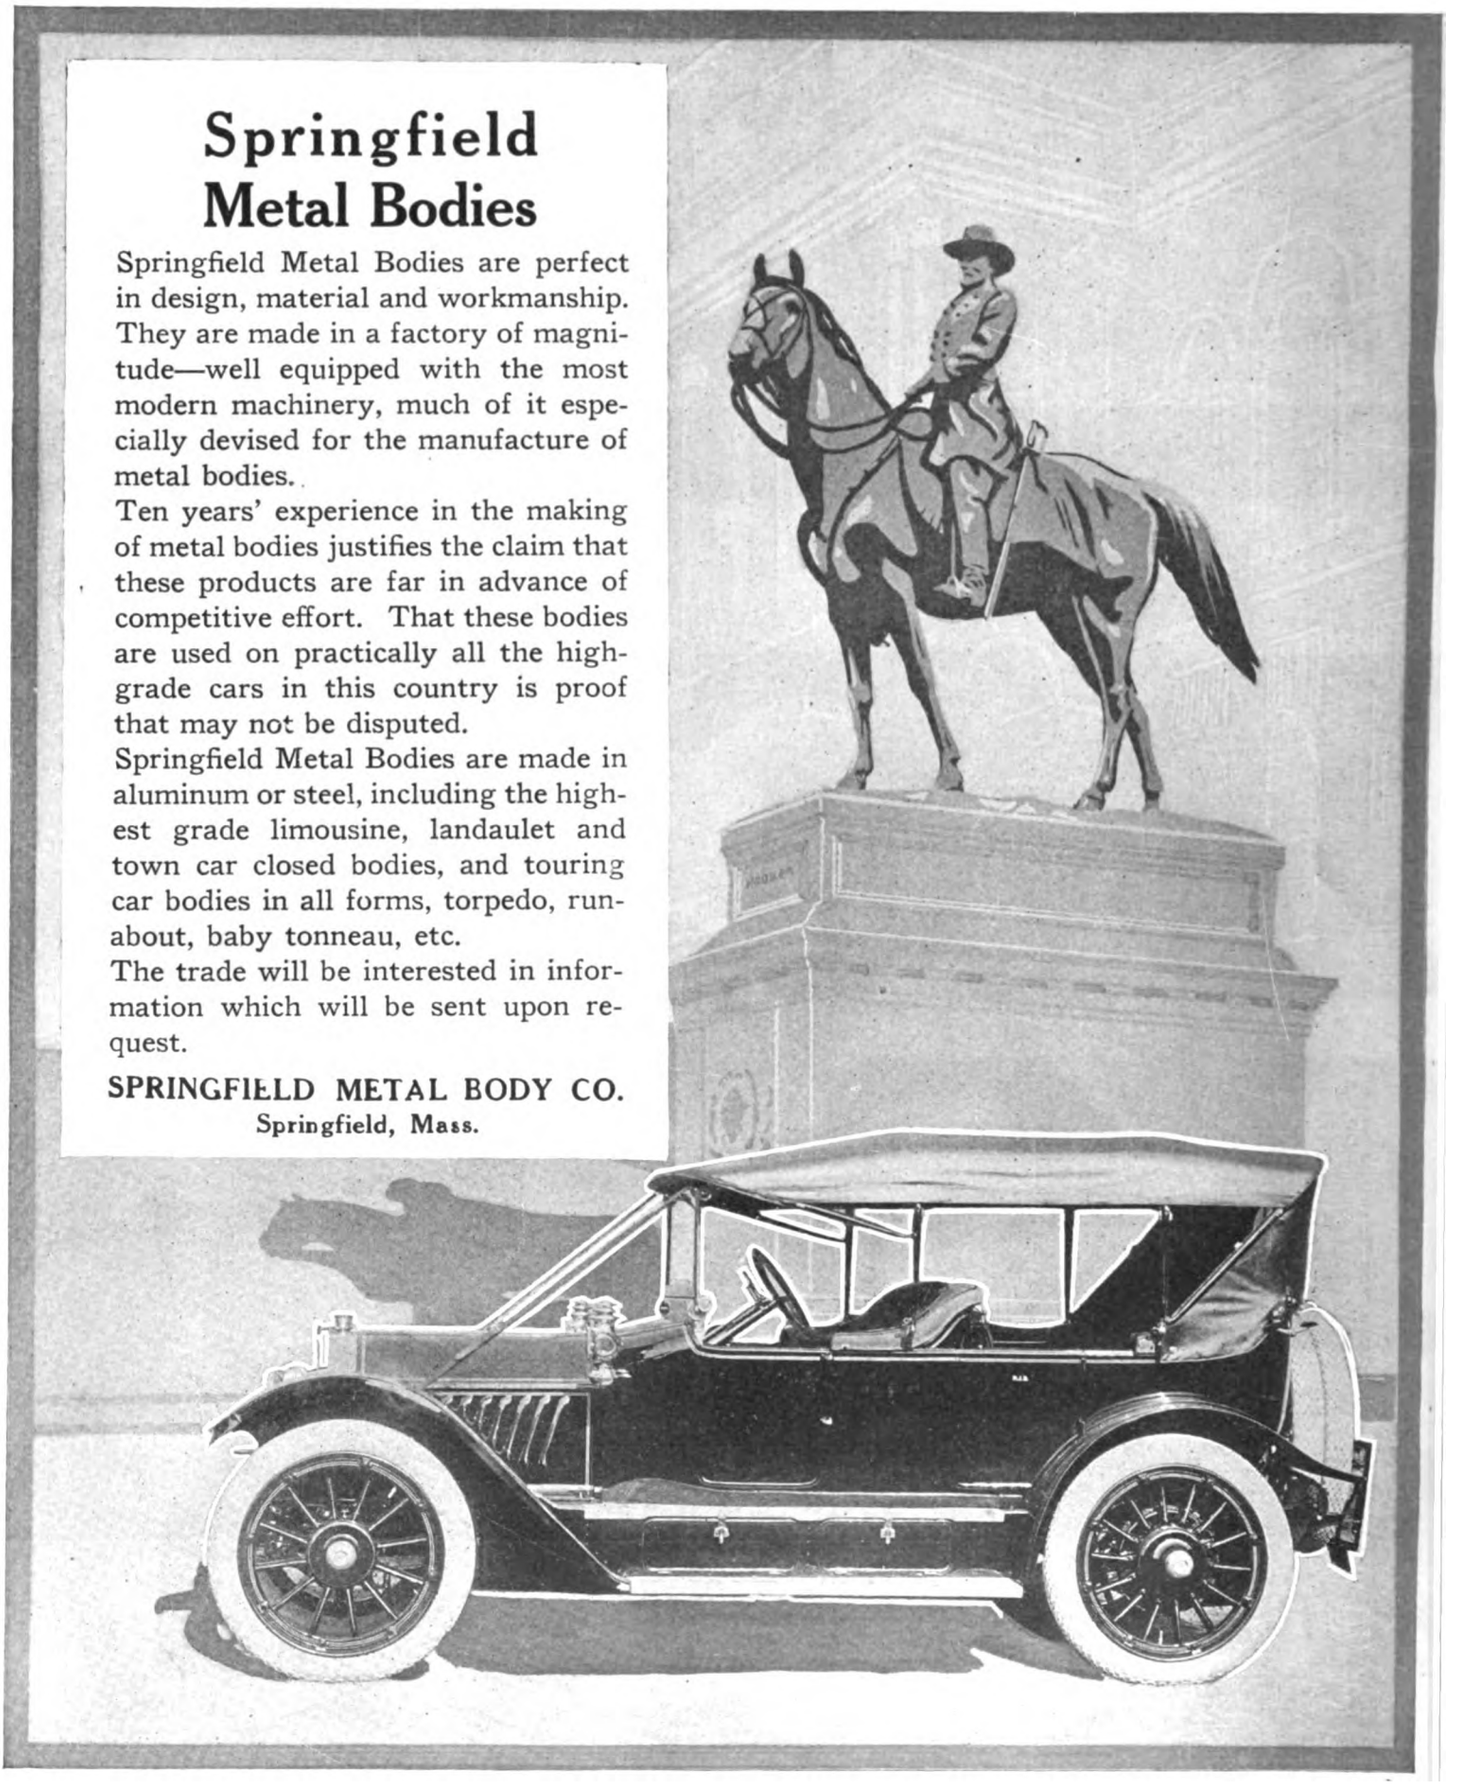
Springfield Metal Bodies



Springfield Metal Bodies are perfect in design, material and workmanship. They are made in a factory of magnitude—well equipped with the most modern machinery, much of it especially devised for the manufacture of metal bodies.

Ten years' experience in the making of metal bodies justifies the claim that these products are far in advance of competitive effort. That these bodies are used on practically all the high-grade cars in this country is proof that may not be disputed.

Springfield Metal Bodies are made in aluminum or steel, including the highest grade limousine, landaulet and town car closed bodies, and touring car bodies in all forms, torpedo, runabout, baby tonneau, etc.

The trade will be interested in information which will be sent upon request.

Tire economy, first, last and all the time—that, Mr. Dealer, is the underlying reason why you should shout for wire wheels and keep on shouting until every car you sell is wire wheel equipped. Fundamentally, there are about a dozen reasons why every car that rides should carry McCue Wire Wheels but the chief reason from your standpoint of delivering the goods to your customers is that they practically double the life of your customers' tires. For this reason if for no other, wire wheels are bound to dominate the situation in America just as they have in Europe—and as usual the wide-awake dealer is the one who sees the handwriting on the wall to-day. Don't wait until you are forced to sell wire wheels, head the procession and insist upon them coming on the cars you sell.

TIRE ECONOMY

Exhaustive tests in actual service have proved that from 30 to 50 per cent. more tire economy results from the use of wire wheels. Heat is an enemy of tires. The metal rim of McCue Wire Wheels dissipates all molecular and frictional heat in tires while wooden rims hold the tire heat within the tires and thus bring about devulcanization.

McCue Wire Wheels use Q. D. Rims. Demountable Rims would defeat the tire saving of wire wheels, as they add weight at the rim or periphery of the wheel. Extra rim weight increases the pound on tires as the wheels go round. The light, heat dispersing rims of McCue Wire Wheels are the main reasons for their economy on tires.

Digitized by Google

STRENGTH

By tests McCue Wire Wheels have six times the load carrying capacity of wooden wheels, and for any given weight, their resistance to side strain is about fifteen to one.

In fact, the strength of the wire wheel is so pronounced that it is almost accident proof. Numerous cases are on record in which the damage to the automobile from skidding has been confined to simply a bent wheel (which was readily straightened), whereas under similar conditions a wooden wheel would have been crushed beyond repair.

WEIGHT

A McCue Wire Wheel complete with tire weighs about the same as an ordinary demountable rim (without the wheel, spokes, hub, etc.) and its tire.

WEIGHT SUSPENSION

The weight of a McCue Wire Wheel equipped car is suspended from 60 to 70 points about the wheel, whereas a wooden wheel relies upon two or three spokes to support the car weight, as a dead weight. Wire wheels, by suspending, act as extra springs or shock absorbers, whereas wooden spokes are rigid transmitters of all shocks to the mechanism of the car.

ALIGNMENT

McCue Wire Wheels are impervious to heat or cold and are not affected by damp weather. A wire wheel always remains true and retains its perfect alignment.

TIRE CHANGES

In the event of puncture, the changing of a McCue quick detachable wire wheel is very rapid and simple, in fact, very much more so than the changing of the majority of demountable rims.

At the recent Indianapolis race many tire changes were made in from 20 to 25 seconds.

McCue Wire Wheels use Standard Ⓢ Spokes. Both spokes and nipples are made from special drawn carbon steel of extreme tensional and torsional strength, by the Standard Co. of Torrington, Conn. They are of the same pattern and consistency as the spokes made for foreign wheels by the famous Coventry (England) Swaging concern.

The McCue Company, Buffalo, N. Y.

MORE EFFICIENT SALESMANSHIP

is generally admitted to be

THE GREATEST NEED OF THE TRADE

MOTOR WORLD

is doing its part to render the need less acute by

"Improving the Breed of Salesmen"

One of its most recent efforts in that direction is the

Offer of Four Cash Prizes

$30 — $20 — $15 — $10

for the best four articles conforming to the title

"My Best Sale; How It Was Made"

The competition is open to everyone who ever sold a car, truck or accessory, but all articles submitted must be received prior to September 1st, next. Non de plumes may be employed, if desired.

If ever YOU made a sale of which you are particularly proud, now's a good time to prove it.

All Contributions to be Addressed:

On July 7th

Premier's new contract will be ready, when dealers' applications and territorial allotments will be taken up for consideration. The success of the

Little Six Premier

America's Greatest Touring Car

has made Premier one of the most sought and profitable high-grade lines in America.

It has doubled Premier business for the dealer and for the factory this year.

No other high-grade manufacturer can show the volume and percentage of increase of the Premier.

Not only the Premier line, but Premier's new contract is an attractive proposition for dealers.

A further production increase of 50 per cent is planned for next season to meet the increased demand.

If interestea, we suggest that you communicate with us at once by wire or letter

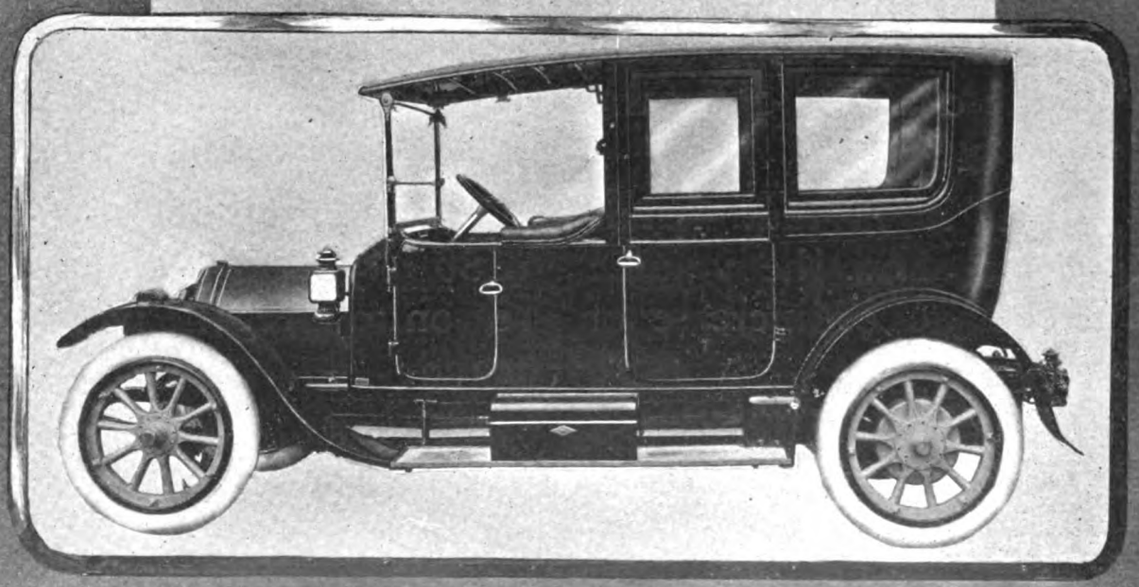
Lancia
Dealers Make Good



In handling the Lancia, the dealer automatically creates an exclusive and most desirable selling connection—and the fact that he may be surrounded by many American agencies lends still *more* prestige to his own proposition.

You, Mr. Dealer, can sell Europe's most exclusive product at American prices and you can, on this basis, offer Lancia cars and equipment to those who are fastidious not only in regard to rakish, unusual European design, but who also understand the actual service value of a car made in Europe, where steel making is an exact science and where engineering genius of the world has reached the high water mark.

Canvass your list of prospects—you can interest plenty of them in a very unusual and distinctive type of motor car, with racing and endurance records back of it that are beyond cavil.

We await your inquiry and we promise our selling co-operation.

Drawing Trade

The old storekeeper made a shrewd move when he placed a drinking trough in front of his store. It was his way of encouraging the country trade.

The modern automobilist is just as human as the farmer. He dislikes to pump up tires. He will go out of his way to find compressed air. It is the little courtesies which you extend to him that make him your friend and customer.

Progressive dealers readily appreciate the silent sales-making qualities of the Hale Curb Box and hundreds are installing complete outfits, not only for curb use, but for inside service as well. The box may be installed in the sidewalk, near the curb, or in the garage flush with the floor. It makes opportunities for the sale of accessories and fuel, for it puts the obligation on the motorist to reciprocate the courtesy you extend through your Hale Curb Box.

Get the details at once. Send for bulletin 12-W.

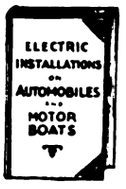
THE Packard Electric Company is the only concern which specializes and concentrates on the production of cable for ignition and lighting service on automobiles and motor boats.

Packard CABLE

Tested Cable

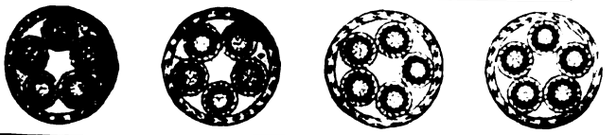


BEFORE it leaves the Packard factory every foot of Packard cable has had a breakdown test far in excess of any possible requirements of the service. A weak spot in the insulation cannot pass without detection.

The final test of Packard cable however is its performance in actual service. On this test we stand, and on it we have built our reputation.

During long, continued hard usage under all conditions it gives best service and is therefore the cheapest

Send For This Book



The only book ever written that covers every phase of electric installation on automobiles and motor boats. Tells how to locate electrical trouble, how to avoid it and how to correct it. Sent postpaid for 25c.

The Packard Electric Co.

Dept. D 50 Warren, Ohio

Packard denotes superior Quality

Our departments of engineering and design co-operate with the men who build the car—combining their weight of experience in radiator making with the particular requirements of the designer of the automobile.

We will not, however, endanger the reputation we have made by making radical changes from established design. In standing by this resolve, we have, on rare occasions been obliged to lose business—something to be regretted, but none the less necessary.

Mayo Radiators are built to hold the engine at an even temperature—not too hot to endanger its usefulness, nor too cool to lose its efficiency. "Tolerance" in change of design is therefore liberal—but it has its limits.

If you, as the man who has sold the car, find yourself in "hot water" so to speak, with a leaky, inefficient radiator and a "superheated" customer, then be sure this car was not equipped with a Mayo Radiator. Dealers who sell cars Mayo equipped know that the radiators will stand up under any unfavorable condition short of a blow with a hammer or a bad collision.

What Is a REAL Tire Protector?

One that does not chafe the tires.

What is the cause of chafing?
Loose fitting protectors, due usually to stretching.

Can stretching be prevented?
No---leather, and even fabric, is bound to stretch.

Can it be overcome?
Yes---by pulling the protectors tight by means of stiff springs which take up the stretch automatically.

Are such protectors made?
Yes---the spring attachment is a patented feature of the oldest and most successful make of protectors---

Business Promotion Through Trade Press Efficiency

is to be the keynote of the most notable gathering of technical, class and trade journal editors and publishers ever held in America. No live manufacturer, sales manager, advertising man, trade paper editor or publisher can afford to overlook the

Eight Annual Convention of the Federation of Trade Press Associations in the United States at the Hotel Astor, New York, Sept. 18, 19, 20, 1913

Two sessions will be held daily. There will be editorial, circulation, advertising and publishing symposiums under competent leaders. Many of the leading editors, business managers, buyers and sellers of advertising, and authorities on modern merchandising methods will take part. On Friday afternoon, September 19, there will be a mass meeting with addresses by representative business and professional men, on subjects of timely interest to editors, publishers and advertisers. Distinguished guests and worth-while speakers will be at the annual banquet, which will be made a memorable social occasion. No matter what may be your connection with the trade journal field, if you are interested in the idea of business promotion through trade press efficiency, if you believe in business papers for business men, you will be welcome at all sessions.

Double Your Mileage and Stop Tire Trouble

Interlocks are complete inner tires—not inner shoes—placed between the outer casing and inner tube to strengthen the casing and protect the tube from punctures. They insure safety—make new tires give twice the usual mileage, and add 1000 to 5000 miles to old ones. Don't affect resiliency. Make your tires blow-out proof.

Car Owners and Dealers

TRIPLEX

A FUEL SAVER and A MONEY SAVER

Increases Power Decreases Cost

The Triplex is a device placed between the manifold and the carburetor to break up the mixture. No matter how imperfectly the carburetor does its work, the Triplex equalizes the mixture, producing an explosive gas of even, uniform quality that will burn clean to the last atom. This means that the user gets all the power all the time—that every fraction of energy to be obtained from the gasoline is produced and used. There is absolutely no waste. High proof gasoline is made out of low, and over 25% is saved on every gallon. For further information write us.

IDEAL STEEL WHEEL (RESILIENT)
STRENGTH COMFORT BEAUTY ECONOMY
IT'S IN THE SPOKES

ANNOUNCEMENT TO DEALERS

We have hundreds of inquiries from automobile owners who want to buy our wheels because they solve the tire problem and double the life of all tires, at the same time making the car ride with luxurious ease. These inquiries are from all sections of the country. With our present distribution we are unable to handle them to advantage.

If you are in a position to handle our wheels and to give demonstrations of them we can offer you a liberal selling contract with exclusive territory and no competition. Ours is a free-trial, money back proposition to the consumer. For the dealer it means quick turns of the small amount of money invested and unusually attractive profits.

Write immediately and get the advantage of our extensive summer advertising.

The Wrapped Tread Method of Mending Blow-outs

Repair tires by the approved method that tire makers have adopted for **making** them. Instead of cutting away a lot of fabric and rubber from the **outside** of the tire, reinforce it from the **inside** with a few layers of canvas, seal the hole through the tire with a plug of raw rubber, and apply heat to the inside and outside at the same time. Thus you can make a repair that is actually stronger than the rest of the tire—one that cant' give way.

SHALER

Steam and Electric VULCANIZERS

This method is economical, requiring only about half as much material as any other system. It is simple—anyone can do the work perfectly. Only one set of forms is required for handling all sizes of tires. By curing from both sides of the tire at once the time of curing is decreased 50 per cent. and all tendency toward overcuring the tire is eliminated.

Wrapped tread repairing can be done best only with Shaler Vulcanizers because they have the exclusive feature of a temperature control that is automatic. This insures the maintenance of a uniform temperature from beginning to end of the cure and does away with constant watching by the operator. He can devote **all** of his time to preparing repairs while the vulcanizer is at work.

Write today for details of this moneymaking process

We have published a book of especial interest to garage men. In addition to other valuable information it contains description of Shaler tire repair outfits. White for free copy of "Common Sense About Tire Repairs."

C. A. SHALER CO., 426 4th St., Waupun, Wis.

Service Stations

for Electrically Lighted Cars

For the convenience of car owners Edison Mazda Automobile Lamp Service Stations have been established all over the country for the renewal of lamps.

These stations enable the motorist to readily obtain the right kind of lamp that will give the most efficient and satisfactory service with the lighting system on the car.

Edison Mazda Automobile Lamps may be obtained wherever either of these signs are seen—locally or when touring.

Look for the signs; they indicate progressive dealers and garages where other high-grade automobile accessories may be purchased.

Remember every sign like the above means lamp service—service backed by the largest electrical manufacturer in the world.

You - as a tire bill payer - now demand a vise-like rim grip-with no cutting or breaking above the rim- and here it is

It's the *rim* as much as the *road* that wears out your tires.

So we said to our Engineers:

"You must build us a tire with Perfect 3-Point Rim Contact."

They did—and they also added the No-Pinch Safety Flap for inner tube protection in

Then we called in our Chemists and said:

"Tire buyers are demanding a tough, flint-like, but resilient tread—a tire made of lusty young rubber—a tire giving the utmost mileage at no additional expense."

And the answer is

Vitalized Rubber

Diamond {No Clinch} Tires

Perfect 3-Point Rim Contact

Here is a No-Clinch tire that appeals to the hard-headed, shrewd tire buyer—the man who insists on easy riding comfort and a good liberal mileage.

Each point of rim contact in a tire is a point of support. Where the points of rim contact are not perfect, undue pressure is brought to bear at an unsupported point of the tire.

Then what happens? The result is a terrific strain on the tire that results in rim troubles, breaking above the bead and separation of the tread from the carcass.

All this is overcome in the Diamond No-Clinch because the three points of rim contact are absolutely *mechanically perfect*—the annealed steel cable wire bead holds with a vise-like, rim-grip.

Add to this the No-Pinch Safety Flap for inner tube protection, the Vitalized Rubber advantage, the famous Diamond Safety (Squeegee Tread) and you have bought rubber shod mileage that has no equal at any price.

So this time buy Diamond Vitalized Rubber Tires—you can get them to fit your rims from

THE KLAXON AT HERALD SQUARE, NEW YORK

By the celebrated French Futurist, FRANCOIS SOUAIE

Among the heavier background lines may be found the clang of trolley-gongs, the rumble of elevated trains, the chugging of waiting motors, the grinding of taxicab brakes, the shouts of van drivers, the voices of newsboys, the gong of a passing ambulance.

CLOSER scrutiny reveals the fainter sounds — the shrill whistles of traffic police, the hum of human voices, the shuffling feet of pedestrians, the nagging, monotonous "honk" of the bulb horn. ABOVE THEM ALL, sharp and penetrating, the note of the Klaxon.

The Six Cylinder Master-piece of one of the Oldest Companies

The new Marion "Six" for 1914 appeals to good, substantial prospects. It justifies in every respect a higher price than cheaper cars sell for, while at the same time it is a car so fine and so substantial that the most exacting need not pay more.

It is the right type of "Six" at the right price. It is a family car; it is the kind which builds up neighborhood sales. Where one Marion is sold you will sell many more. And the 1914 Marion dealer's contract is different from any you ever read. Wire us today for particulars.

21 YEARS

of electrical experience are back of the Gray & Davis 6-volt Electric Starter

Consider what this means.

The Gray & Davis Starter is not a "hope-it-turns-out right." It is not a half-baked device hastily marketed to meet the sudden and universal demand for an electric starter.

It was designed and perfected by one of America's leading electrical engineers—a man who had 21 years' experience in constructing electric motors.

The Gray & Davis Starter is the simplest in design. It is produced by expert workmen in the finest factories of their kind in the world.

A 100%-efficient starter is the result. Leading car manufacturers have adopted it as the best. No other starter has met with such general approval from automobile manufacturers and engineers.

You can get Gray & Davis service only on the cars that are equipped with this one time-tested starter *that never fails.*

Write today for our complete catalog.

When you think
of Shock Absorbers
what name comes
to your mind?

**Can any dealer afford to handle cars in 1914
which are not equipped with shock absorbers?**

Digitized by Google

THE Confidence of the Firestone user explains the rapidly increasing demand for Firestone Non-Skid Tires.

—Confidence in the builder, who is personally responsible for every tire—whose name on the tire is a guarantee in itself.

—Confidence in the secure road-grip of Non-Skid sharp edged letters, abrupt angles and deep hollows.

—Confidence in their ability to take the car safely wherever the engine has power to go.

—Confidence in the extra resilience of the extra thick tread to protect the driving mechanism from the bumps and jolts of the road.

Firestone

Non-Skid Tires

The name NON-SKID, forming the tread, makes skid impossible—prevents wheel spinning—increases traction—reduces operating expense.

The "name-tread" insures longest wear, radiates the heat, reduces tire expense.

Get "What's What In Tires" by H. S. Firestone—free.

As to Rims—Firestone Quick-Detachable Demountable Rims are regular equipment for most high-grade cars. The Rim Book explains.

Firestone pneumatic tires are guaranteed when filled with air at the recommended pressure and attached to rims bearing either one or both of these inspection stamps. When filled with any substitute for air or attached to any other rims than those specified our guarantee is withdrawn.

Vol. XXXVI New York, U. S. A., Thursday, July 10, 1913 No. 3

FIAT BRINGS SUIT AGAINST ISOTTA FOR INFRINGEMENT

Torque Tube Construction the Point Involved — But Suit Discloses Long-Pending Fiat Patent on Two-Speed Axle.

Making known for the first time that the Italian Fiat company has developed and may use a rear axle of the two-speed type, equity proceedings have been instituted in the United States District Courts by F. I. A. T., of Poughkeepsie, N. Y., for an injunction to restrain the Isotta-Fraschini Motors Co., of New York City, from infringing its patents on a device of the kind. The patent that forms the basis for the action is numbered 1,050,049 and was issued on January 7th, 1913, to Giovanni Agnelli of Turin, Italy, and assigned to F. I. A. T. of Poughkeepsie; probably the fact that it has been "in the mill" ever since the application was filed on July 16th, 1907, accounts for its obscurity.

The axle covered by the patent, which is entitled "Driving-Gear for Motor Road-Vehicles," is not unlike the Evans and Lancia axles that have been used to some extent abroad and the Austin axle developed by the Austin Automobile Co., of Grand Rapids, Mich., and disclosed for the first time at the last Chicago automobile show; the two former provide for two or more direct drives and the latter provides for only two. In this respect, the Fiat axle approaches more nearly the Austin device.

In its simplest aspect, the Fiat axle can be described as a pair of concentric driving shafts carrying separate bevel pinions permanently in mesh with separate driven bevels attached to the driven shafts that turn the road wheels.

There are eight claims in all in the original patent specification, and though the action as it stands is intended to cover the whole patent, the chief feature involved in the litigation is the familiar Fiat yoke torque tube construction by means of which the necessity for radius and reach rods is eliminated and which is described in the specifications as follows: " . . . a reach rod casing enclosing said shaft connected at one end to said axle, a yoke rotatably connected to the other end of said casing, means preventing relative longitudinal movement between said casing and said yoke, a horizontal pivotal connection between the ends of said yoke and the frame in the plane of said universal joint."

Franklin also to Discontinue "Fours."

Joining the increasing number of manufacturers who have taken similar action, the H. H. Franklin Mfg. Co., of Syracuse, N. Y., has discontinued the manufacture of four-cylinder cars and will concentrate its efforts entirely on the production of "sixes." First reports stated that only the Franklin "little six" would be continued, but such is not the case, as both the so-called "little" and "big" ones will be produced exactly as heretofore.

Present prices will be maintained, and if any mechanical changes are made they will be of a minor character. At any rate, as the Franklin company abandoned the annual model policy two years ago, if any changes are found advisable they will be made without regard to date and simply in the regular process of manufacture of the machines.

Brooklyn Gills to Make Heavy Trucks.

Having gained much valuable experience in the building of heavy commercial vehicles for the Hewitt Motor Co. prior to the taking over of that company by the International Motor Co., P. M. Gill & Sons, of 2 Lorraine street, Brooklyn, N. Y., are preparing to take up the manufacture of a truck of their own design. For the present, however, experimental work only is being carried on; the actual production of vehicles will not be commenced for six or seven months. The truck to be produced will be a large one—probably between five and ten tons capacity.

"AUTO CENTER" BEGINS TO SHOW SIGNS OF WEARINESS

World's First "Permanent Accessory Exhibition" Takes Down its Flags and Shrivels—"Promised Capital" its Only Hope.

Auto Center, Inc., has hauled down the American flag. The manager of that "automobile department store," or "permanent accessory exhibition," is not yet ready to acknowledge complete defeat; but the fact remains that the American flags, which were the chief adornments of the second floor of the Long Acre Building, at 42d street and Broadway, New York, where the Center established itself in March last, have been furled and what remains of the exhibits have been carried to the third floor, where they are spread in very much contracted space and with no flags gracefully draped above them, and with no signs on the windows to call attention to their location. Despite the contraction, John M. Gorham, who promoted the enterprise and who managed it, still lives in hope.

"If we secure the capital that has been promised," he said only yesterday to a Motor World man, "we will be booming within 30 or 60 days; if it fails us, the outcome is problematical."

Gorham is a cheerful person and, truth to tell, Auto Center has required no small fund of cheerfulness since it first was inaugurated. For not only were exhibits few and far between—approximately, there were only 20—but visitors were almost as few as the exhibits; none of those who had to do with the latter were ever greatly pressed for time.

In February last, when Motor World first and exclusively presented the news that such an enterprise was to be inaugurated, it attracted wide attention, chiefly as an interesting experiment. At that time, Gorham himself stated that not less than 45 accessory manufacturers had contracted for

Digitized by Google

space, and as they had been given the privilege of sub-leasing, he estimated that at least 110 different exhibits would be in place before the Center opened for business.

On three separate occasions, when Motor World men visited the establishment to enumerate the exhibitors and their exhibits, Gorham was earnest in his declarations that if the promised descriptions were delayed "a week or two" very many of the delinquents would be "among those present."

Few of them, however, did put in an appearance and Gorham now frankly expresses his disappointment. He offers no explanation as to why about half of those whom he said had contracted for space failed to live up to their contract, but, as stated, he has not entirely despaired and is firm in the belief that if the promised capital is forthcoming "all will be happy yet, you bet."

The Auto Center was incorporated, under the laws of New York, with an authorized capital of $25,000 and, according to information supplied by Gorham at the time, the president of the corporation was William A. Kelsey, of Meriden, Conn., president of the Kelsey Printing Press Co. and of the Meriden Morning Record, and the treasurer was John Stanley, cashier of the First National Bank in Whitestone, L. I.

Prest-O-Lite Checks New Jersey Refillers.

Camille and Ida Bourbonville, of Newark, N. J., trading as the Acetylene Appliance Co., on Monday last, 7th inst., were permanently enjoined by the Federal Court for the District of New Jersey from filling, selling or in any way dealing with tanks bearing Prest-O-Lite trade marks "without in every case permanently removing and obliterating the name Prest-O-Lite."

The action in this case is similar to other suits filed in the New York and other jurisdictions by the Prest-O-Lite Co., but the decree differs from some of the others in that it provides that the injunction shall not become effective if the defendants file a bond in the sum of $3,000 and also pay the plaintiffs all profits which may be derived from the use or sale of Prest-O-Lite tanks.

To Build Truck Bodies in Cleveland.

The Commercial Auto Body & Mfg. Co., of Cleveland, which was incorporated last month with a capital of $50,000, of which F. L. Fuller is president, has just completed the equipment of its plant at 5345 St. Clair avenue, which building previously was occupied by the American Railway Signal Co. The new occupant, as indicated by its title, will make a specialty of building truck bodies.

POPULAR-PRICED "SIX" ADDED TO MARION LINE

Left Drive, Center Control and Other New Features in Car Listing at $2,150—"Four" to Be Continued.

Marking the entry of still another well-known manufacturer into the six-cylinder field, the Marion Motor Car Co., of Indianapolis, Ind., without previous intimation of its intentions, has quietly developed and now has placed on the market a "six," the first, needless to add, that has borne the Marion name-plate; the single four-cylinder model is to be retained and at its original price of $1,475. The price of the new "six" with complete equipment, which means, of course, that it has an electric lighting and engine starting system, is $2,150.

The motor in the new car is of the L-head type with its cylinders cast in sets of three; bore and stroke are 3¾ and 5¼ inches, respectively, the piston displacement therefore being 347.8 cubic inches and the A. L. A. M. rating 33.75 horsepower. Conforming to the growing tendency, the camshaft is driven by "silent" chain and spirally cut gears drive the magneto and pump shafts. The lighting and engine starting equipment bears the Westinghouse trade mark. The steering gear is placed at the left side with the control levers in the center and the seats are upholstered in Turkish fashion. The other essential elements of the car include pressure gasolene feed, full-floating rear axle, two sets of brakes on rear wheels, 124-inch wheelbase and 35 x 4½-inch tires on demountable rims. Equipment includes mohair top with boot and side curtains, rain-vision windshield, Stewart 60-mile speedometer, electric horn under hood, and its Westinghouse electric lighting and engine starting system, in addition to the usual complement of tools, spare parts, etc.

Newark Chooses Officers and Show Dates.

Although it was understood that the promotion and management of the next Newark (N. J.) show would be transferred by the New Jersey Automobile Exhibition Co. to the New Jersey Automobile Trade Association, at the annual meeting of the latter body last week it was decided that it were better that the old order of things be continued. The two organizations are composed largely of the same dealers, but in order to give the Trade association direct representation, Joseph C. Bell and George H. Smith were elected members of the Exhibition company's board of trustees.

The other members of the board are C. Louis Fitzgerald, Walter H. Ellis, J. W. Mason, George Paddock, Inglis M. Uppercu and Horace A. Bonnell. They, in turn, elected officers as follows: C. Louis Fitzgerald, president; George H. Smith, vice-president; H. A. Bonnell, secretary-treasurer. The matter of holding the next show in December was discussed, but in the end it was decided to retain February dates, as usual. Accordingly, the show will open February 21st and close seven days later, February 28th.

To Build Schram Car in Seattle.

For the purpose of building a car designed by A. J. Schram, who at one time built the Sunset car in California, a $500,000 company has been formed in Seattle, Wash., with F. J. Carver, of that city, as president. Schram himself is vice-president, W. R. McClelland treasurer and F. A. Mitchell secretary. It is stated that the car will be built in both four- and six-cylinder types, the former listing at $1,500 and the latter at $2,200.

New Process Rawhide Reduces Capital.

The New Process Rawhide Co. has filed notice of reduction of capital from $40,000 to $10,000. The chief business of the company was taken over in June last by the New Process Gear Corporation, capitalized at $1,000,000, the old company being continued with reduced capital only for the purpose of operating the plant utilized in the preparation of hides and for the purpose of preserving certain property rights.

Hydraulic Drive Due from Wisconsin.

The Beijer Hydraulic Transmission Co., of Stevens Point, Wis., which was recently organized by A. P. Beijer, inventor of a new type of hydraulic drive, has established a small shop in that city, where he is building a number of his transmissions for demonstration purposes. Associated with him in the enterprise is W. E. Atwell, who is secretary and treasurer of the company.

Studebaker Gives Up Sacramento Branch.

The Studebaker Corporation has discontinued its branch and warehouse in Sacramento, Cal. The horse vehicles have been taken over by the Emigh-Winchell-Cline Co., while the Studebaker automobile agency has been acquired by T. B. Richards and Isaac Christie.

Monarch Moves Into Its Factory.

The Monarch Motor Car Co., of which R. C. Hupp recently became president and general manager, has taken possession of the factory building at 1528 Jefferson avenue, East, Detroit; the location is at the corner of Baldwin avenue.

POPULAR-PRICED ELECTRIC AT LAST IN PLAIN SIGHT

Runabout to Sell for Less Than $1,000 Appears in Toledo—Suggests Gasolene Car Practice in Many Features.

Long expected, the under-$1,000 light electric car is at last in a fair way of becoming available. Backed by Chicago capital, Carl Probst, of Toledo, Ohio, is the man who has performed the development work, his first car having made its appearance on the streets of Toledo during the present week after a considerable period of experimentation.

While the company to manufacture it has not been fully organized, it is known that two electrics will be produced—a runabout listing at less than $1,000 and a coupe at less than $1,300, the same chassis being utilized for both vehicles. They will have a wheelbase of 96 inches ,a tread of 50 inches and 30 x 3½ inch tires, probably on wire wheels. The new cars will also employ full floating rear axle, a double reduction shaft drive and all four springs will be of the Lanchester suspension or cantilever type.

The runabout is equipped with a perfect stream-line bodly, pointed in the front and broad at the rear, being designed to afford minimum air resistance. It will also be distinguished by left-hand control and wheel steer and will easily make 25 miles per hour. The seats are roomy and ample leg room is provided. In general appearance, it somewhat suggests the Grant semi-cycle car, which recently was illustrated in Motor World, but it is larger and, if anything, even better looking.

Big Four Horn Causes Discordant Note.

Differences between H. C. Evelyn, the inventor, and Fleming, the business manager, who comprises the Big Four Horn Co. of Watseka, Ill., have resulted in the filing of a petition asking that the company be dissolved. Evelyn claims not to have been treated fairly, and it is understood to be negotiating with a Chicago manufacturer to take over his patents and other rights.

Will Appeal from Prest-O-Lite Decision.

The Appellate Term of the Supreme Court for New York county this week granted permission to F. Ray, operating as the Smith-Haines company, and to the Brückner Auto Supply Co., both of which are New York supply houses, to appeal to the Appellate Division from the decision in favor of the Prest-O-Lite Co. rendered by the Municipal Court and affirmed June 25th by the Appellate Term. The decision held that the refilling of Prest-O-Lite tanks with other than Prest-O-Lite gas and the sale thereof is grounds for the recovery of a $100 penalty for every offense.

Cadillac Mixed With Caesar and Goby.

Due to the work of a disingenuous advertising writer, the Cadillac Motor Car Co. and some of its agents have been put to the pains of denying that the Cadillac company had, would or might adopt the Goby sleeve valve engine. The d. a. w. evidently considered it a stroke of genius to print in full page form the address, "The Ideal Automobile Plant," delivered by H. M. Leland, of the Cadillac Motor Car Co., at the S. A. E. banquet in Detroit in June last, and then so mixed Leland with Demosthenes, Cicero, Caesar, Napoleon, Dante, Shakespeare, Moliere and the Goby engine that there was no telling exactly what the advertisement meant. There were enough persons, however, who assumed it meant that the Cadillac car of the future would be equipped with the Goby engine to require denials all along the Cadillac line. In response to Motor World's inquiry, the denial from the Cadillac factory was unreserved.

Reo Resumes Payment of Dividends.

Having passed its dividend in October last, the Reo Motor Car Co., of Lansing, Mich., whose shares recently were placed on a 10 per cent. basis, is making good for its lapse. The first quarterly dividend of 2¼ per cent., under the new arrangement, is now being disbursed, accompanied by an extra dividend of the same amount.

Chevrolet Establishes Two Branches.

The Chevrolet Motor Co., of Detroit and Flint, Mich., will this week open a New York branch at 1651 Broadway, New York, and another at 1505 Bedford avenue, Brooklyn. George H. Connor is in charge of the New York establishment, and Warren A. Sellon of the Brooklyn place.

Hexter to Become "Willys Service."

The Hexter Motor Truck Co., of New York, which several months since was acquired by John N. Willys, of Toledo, has been legally authorized to change its name to the Willys Service Corporation. The change, however, will not become effective until August 11th.

Henderson to Sell Treasury Stock.

The Henderson Motor Car Co., of Indianapolis, has voted to sell the unissued stock remaining in its treasury, which amounts to $100,000. It is probable that the shares will be taken up by present stockholders.

COURT ORDERS A ST. LOUIS DEALER TO CUT HIS SALARY

If Halsey Does Not Do So and Fails Also to Return Money to Treasury, Receiver Will Be Appointed.

As a result of proceedings instituted by J. D. P. Lewis, a stockholder, Oscar L. Halsey, president of the Halsey Automobile Co., of St. Louis, Mo., has been ordered by the court to pay $10,000 into the treasury of the company for the benefit of stockholders, and to refund all salary as president in excess of $750 a month received by him since last November; the court also has instructed that a resolution be adopted fixing Halsey's salary at not more than $9,000 a year. In his petition for a receiver, filed in February last, Lewis charged that Halsey had raised his salary from $4,200 to $20,500 per year.

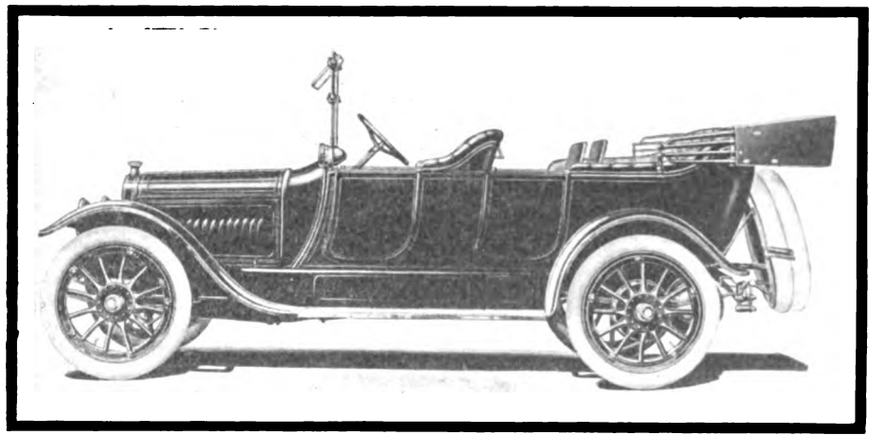
If the court's order is complied with in 30 days, the suit will be dismissed. Otherwise, a receiver shall be appointed to take charge of the company and to recover from Halsey the sums specified in the decree.

The $10,000 which Halsey is directed to pay to the company, represents what Halsey saved himself in a deal when he sold to the Halsey company property at Twenty-second and Locust street, which a realty company, of which he was the principal owner, got in a trade for property at Euclid and Maryland avenues. Lewis alleged the Halsey company paid too much for the Locust street property.

The Halsey company handles the Packard car in St. Louis, and in his petition the stockholder charged that Halsey had formed a separate company to sell Cadillacs.

Ford Redenies 3-for-$1,000 Rumor.

Although it was officially denied some two months ago, and despite its ridiculousness, the old rumor persists that the Ford Motor Co. purposes marketing its enormous output direct to owners and on what may be termed an apple-and-orange basis—that is, three cars for $1,000. None knows where the silly report originated, but it is still encountered in many unexpected places and has been swallowed without salt by many otherwise intelligent persons.



While scarcely necessary, the Ford company has again repudiated the story and, apart from the absurdity of a big company marketing an enormous product on the so-called club plan, it requires little figuring to make clear to any tradesman that the marketing of the Ford car, or any other real car, at any price approximating $333.33 1/3 is an utter impossibility.

LOZIER RE-EMBRACES "FOUR" AND LOPS OFF "BIG SIX"

New Model Lists at $2,100 and, With "Light Six," Will Constitute Line —Unusually Long Stroke Motor Employed.

After having confined his activities to the production of "sixes" exclusively for the past few years—a "big six" and, later, a "light six" which in the time it has been on the market has proven so popular that the construction of the larger car is to be discontinued—the Lozier Motor Co., of Detroit, Mich., has restored a part of its affection to its first love, so to speak, and for the season commencing January 1st, 1914, will market a medium-priced "four" to sell

NEW LOZIER FOUR-CYLINDER MODEL WHICH LISTS AT $2,100

for $2,100; the "light six" is to be continued at its original price of $3,250. That the action of the Lozier company in bringing out a four-cylinder model in the face of such steady increase in the production of "sixes" and when nearly every other manufacturer is bringing out new six-cylinder models, has caused a mild sort of a sensation in trade circles goes without saying; the reason for the unexpected innovation is put down as an unfilled demand for a high-class "four" listing at a moderate price, and it is proposed to fill this demand with the new Lozier "four."

In appearance, the new "four" will be almost exactly like the "light six" and will be driven from the left side with the control levers in the center. The motor is of the L-head type, with cylinders measuring 4½ x 6½ and such well-known features of Lozier construction as force-feed lubrication and "silent" chain camshaft drive are retained. A Bosch dual ignition system furnishes sparks, and cooling is by pump-circulated water. A complete Gray & Davis electric lighting and engine starting system is part of the equipment. Transmission elements consist of the usual oil-bath multiple disk clutch and three-speed selectively operated gearset. The wheelbase of the new car is 120 inches on 36-inch wheels shod with 4½-inch tires on demountable rims. Standard equipment includes top, built-in windshield, speedometer, extra rim and tire carriers.

Three Cars in Partin-Palmer Line.

In addition to the 38-horsepower six-passenger Partin-Palmer car, which will be made by the Palmer Motor Car Co., of Detroit, and marketed by the Partin Mfg. Co., of Chicago, as stated in Motor World of June 5th, there also will be manufactured and marketed by the respective parties the Crown cyclecar and the Partin "45," also a six-passenger touring car.

The Partin-Palmer "38" will utilize a Mason motor and will have a wheelbase of 115 inches and be marked by center control with left-hand drive; it will list at $975. The Partin "45," which will mount a 45-horsepower Rutenber motor, will have a wheelbase of 120 inches and will sell, fully equipped, including an electric lighting and starting system, for $1,275. The Crown cyclecar will have a four-cylinder 21-horsepower motor and will sell for $385.

The sales department of the Partin Mfg. Co. will be directed by C. C. Darnell, who is well known in the West and who until recently was sales manager of the Crow Motor Car Co., of Elkhart, Ind. The Partin Mfg. Co. itself is a partnership composed of George H. Partin and H. F. Graper, both of whom are Tennessee men of ample means.

Rauch & Lang Undertake Enlargement.

The Rauch & Lang Carriage Co., makers of the R. & L. electric, have commenced work on the enlargement of their factory in Cleveland. The addition will be a brick and steel structure, 112 x 199 feet, which will afford 78,000 square feet of additional floor space.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

Joseph M. Everett has been appointed manager of the Dayton Tire Co., of Boston. Previously he was manager of the Walpole branch in that city.

J. W. Willcox, who has handled Henderson cars in Los Angeles, has left the retail trade to become district manager in Southern California for the Henderson Motor Car Co. Temporarily he will make his headquarters at 1053 South Olive street, in Los Angeles.

F. Hughes Moyr, former chief engineer of the Firestone rim plant in Akron, Ohio, has been appointed chief engineer of the General Rim Co. While maintaining an executive office in New York, the latter has transferred its headquarters and manufacturing operation to Cleveland, Ohio, where Moyer will be stationed.

G. R. Wadsworth, for three years engineering manager of the Peerless Motor Car Co., of Cleveland, has resigned that office to become associated with Gray & Davis, of Boston. As the Peerless people were the first to embrace the Gray & Davis lighting and starting system, it goes without saying that Wadsworth is thoroughly familiar with it.

R. H. Losey, who about a year since became sales manager for the Republic Motor Co., one of W. C. Durant's enterprices, has returned to Indiana, whence he came. Before joining the Republic staff he was manager of the Buick branch in Indianapolis, but he now has been appointed sales manager of the Westcott Motor Car Co., of Richmond, Ind.

Hard to Get Even Sample Wire Wheels.

However opinions may differ regarding wire wheels, there is no doubting the position of the McCue Co., of Buffalo, N. Y. W. F. Evans, its general manager, stated to a Motor World man one day this week that so great is the demand that, while the company is making deliveries according to contract, it is not able to deliver even a sample set of wire wheels in less than three weeks time. At least a measure of relief, however, is contained in the addition to the McCue plant, which it is expected will be completed in about three weeks and which will afford 36,000 square feet of additional floor space. This will permit the plant to attain a capacity of about 1,000 wheels per day.

The Week's Incorporations

Chicago, Ill.—Pneumatic Gearshift Co., under Illinois laws; authorized capital, $25,000. Corporators—G. W. Killelea, E. O. Loewen, D. Krinsky.

Bowling Green, Ohio—Modern Motor Car Co., under Ohio laws; authorized capital, $10,000. Corporators—W. P. Abbey, Dale I. Ladd, R. E. Ladd.

Milwaukee, Wis.—Hoppe-Hatte Motor Co., under Wisconsin laws; authorized capital, $15,000. Corporators—A. C. Hoppe, G. R. Hoffman, L. M. Noah.

Raymond, Wash.—East Side Auto Stage Co., under Washington laws; authorized capital, $12,000. Corporators—W. J. Trimble, L. B. Johns and others.

Detroit, Mich. — Overland-Detroit Co., under Michigan laws; authorized capital, $10,000; to deal in motor cars. Corporators—Charles E. Baker, S. C. Fisk.

Wilmington, Del.—Brookes Motor Car Co., under Delaware laws; authorized capital, $5,000,000; Corporators—Charles B. Bishop, Clarence J. Jacobs, Harry W. Davis, all of Wilmington.

Cincinnati, Ohio—Commercial Motor Car Co., under Ohio laws; authorized capital, $50,000. Corporators—Walter G. Vessler, H. A. Hoelscher, E. H. Hoelscher, W. C. Hoelscher, George Schorr.

Wilmington, Del.—The Tire Place, under Delaware laws; authorized capital, $100,000. Corporators—J. G. Hughes, Haddonfield, N. J.; H. Fischer, Philadelphia, Pa.; H. W. Davis, Wilmington.

Dayton, Ohio—Dayton Buick Co., under Ohio laws; authorized capital, $10,000; to deal in motor cars. Corporators—L. J. Haughey, Charles Abel, Joseph A. McKenny, Earl Simon, A. J. Smith.

Great Neck Station, N. Y.—Charles W. Smith Taxicab, Inc., under New York laws; authorized capital, $2,000. Corporators—Charles W. Smith, Eleanor C. Smith and James G. Ketcham, all of Great Neck Station.

Wilmington, Del. — International Metal Wheel & Supply Co., under Delaware laws; authorized capital, $100,000. Corporators—W. H. Dean, Newark, N. J.; E. C. Jackson, Wilmington; W. H. Cooper, Jr., Newcastle.

New York, N. Y.—Standard Purchasing Co., Inc., of Manhattan, under New York laws; authorized capital, $10,000. Corporators—Harry I. Cook, 99 Macon street, Brooklyn; Harry F. Dexter and William H. Brooks, both of Tom's River, N. J.

Georgetown, Del.—Georgetown Garage & Supply Co., under Delaware laws; authorized capital, $10,000; to deal in motor vehicles and conduct a garage. Corporators—Linford P. Faucett, James W. Faucett, Elijah W. White, all of Georgetown.

Chicago, Ill.—Sure Shot Automatic Puncture Proof Co., under Illinois laws; authorized capital, $10,000; to manufacture and sell liquid or semi-liquid paste for stopping punctures. Corporators—A. C. Allan, D. J. Heaphey, Barney Coffey, all of Chicago.

New York, N. Y.—G. B. Sales Corporation, under New York laws; authorized capital, $5,000; to deal in motor car accessories. Corporators—Edward E. Reardon, 246 East 49th street; Francis J. O'Grady, 581 East 168th street; Irving V. W. Williams, 661 Madison avenue.

Minor Business Troubles.

George H. Platt, a garage keeper at 367 Fairfield avenue, Bridgeport, Conn., has filed a petition in bankruptcy. He schedules liabilities amounting to $2,381 and assets to the value of $469.

The Taxi-Motor Cab Co., of Boston, against which an involuntary petition in bankruptcy was filed several months since, last week entered a formal denial of the allegations of insolvency made by the creditors. The case was sent to a referee, who will delve deeper into the company's affairs in an effort to discover the facts.

Because he failed to carry out the provisions of his lease, Samuel Simon, who operates as the Motor Renting Co., which was petitioned into the hands of a receiver in November, 1912, and the Cathedral Park Garage, of 145 West 110th street, New York City, has been adjudged insolvent by the Supreme Court for New York county and on the petition of the Autocar Co., of Ardmore, Pa., their affairs have been placed in the hands of Charles C. Campbell as receiver. According to the bill of complaint, the Autocar company holds the lease on the property occupied by Simon as the Cathedral Park Garage, for which it was to have received $100 monthly rental from October 1st, 1912, to May 1st, 1913, when a final payment of $31,886.14 fell due, but as none of these payments had been made, action to foreclose the mortgage was instituted, which resulted in the appointment of the receiver. Simon entered no defense.

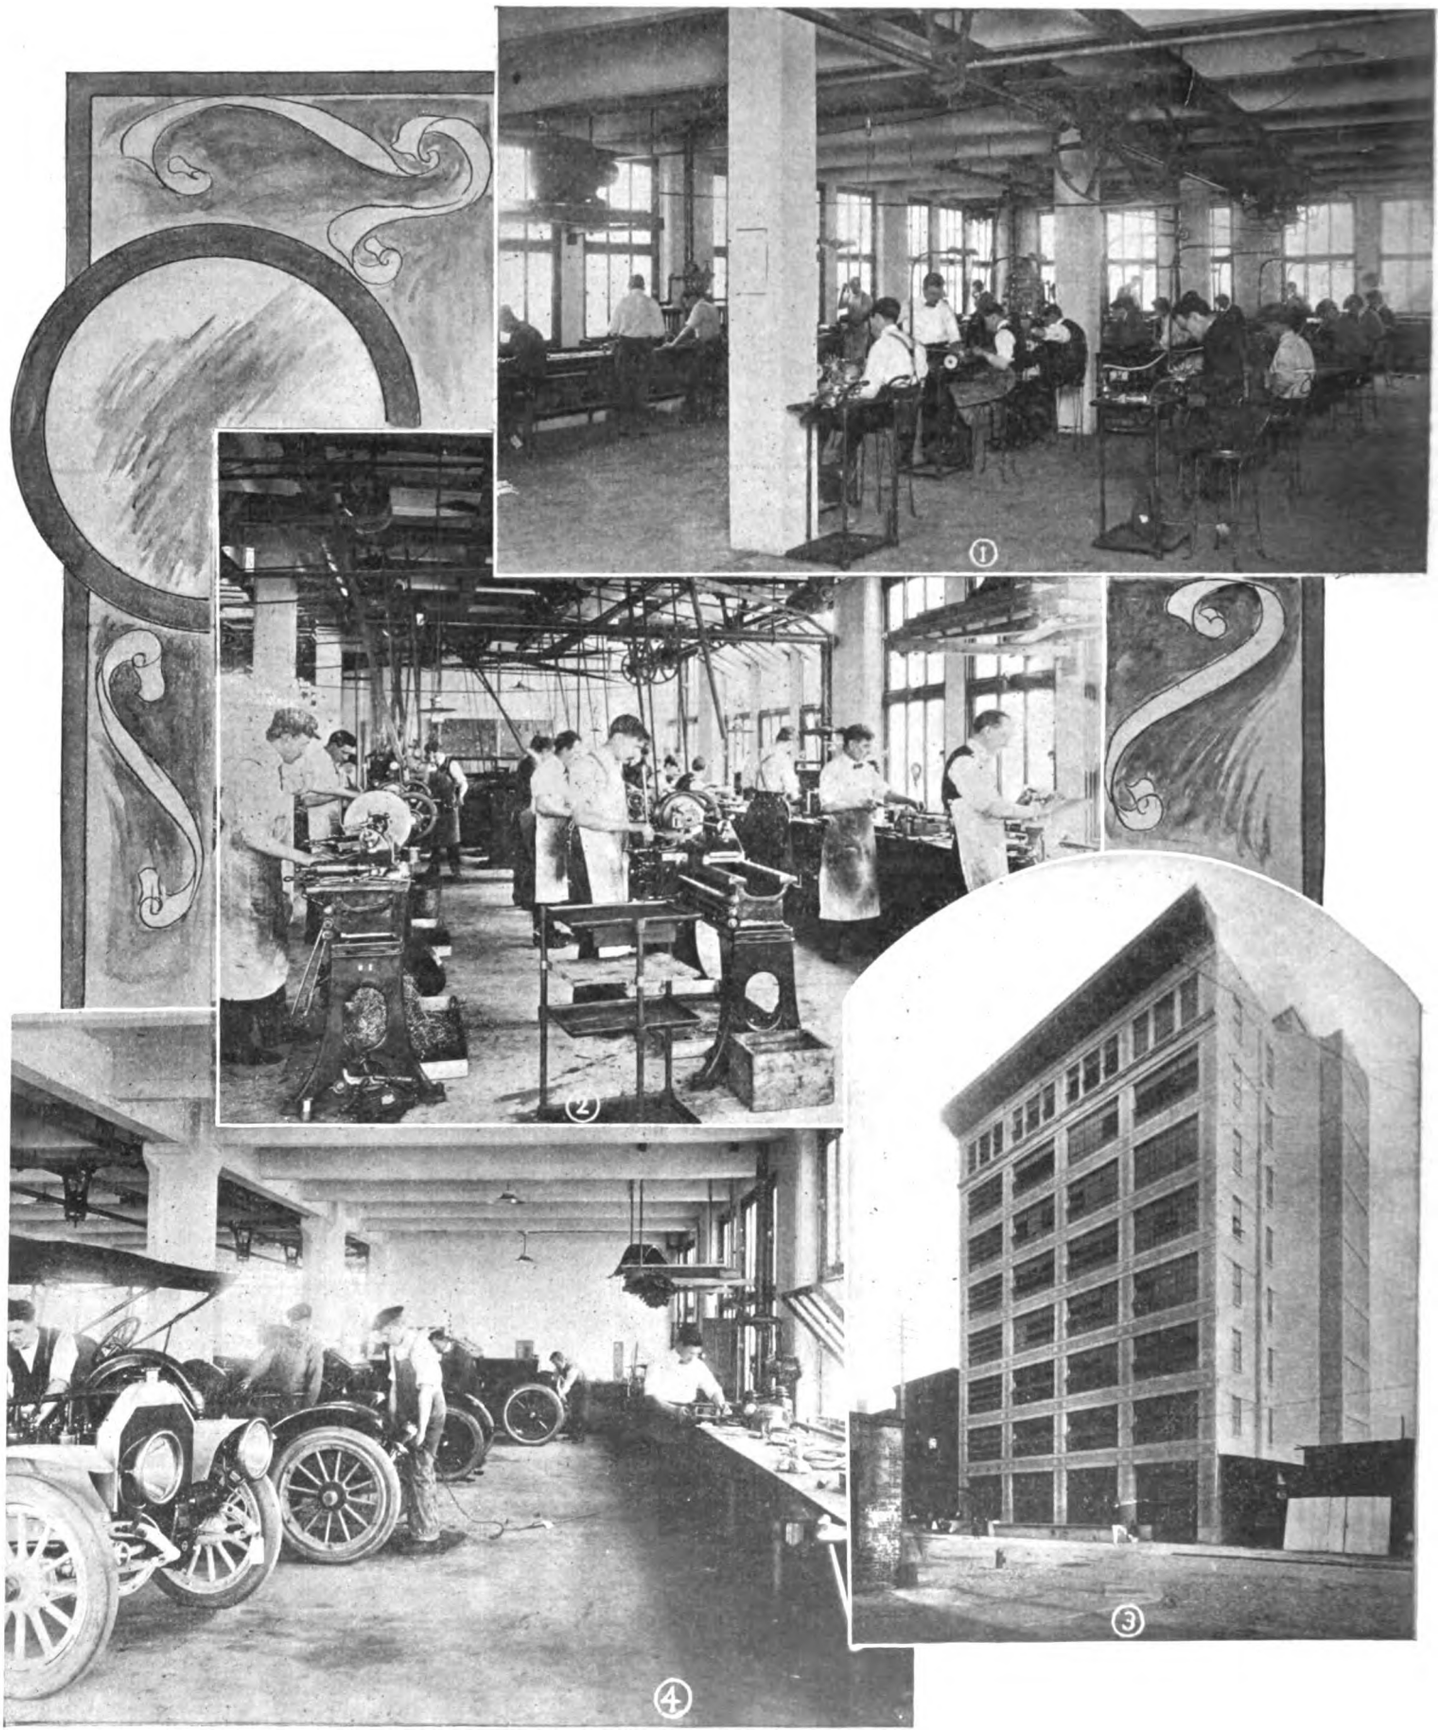
Phoenix Tractor Going to Kansas City.

The American Gas Engine Co., Kansas City, Mo., which succeeded the Sheffield Gas Power Co., has purchased the plant and business of the Phoenix Tractor Co., of Winona, Minn.; it is understood that the equipment of the latter will be removed to Kansas City, where the manufacture of the Phoenix tractor will be carried on on a much larger scale.

Goodyear Develops Tire for Electrics.

The Goodyear Power Saver pneumatic tire is the style of a new tire which just has been placed on the market by the Goodyear Tire & Rubber Co., of Akron, Ohio. It is designed especially for use on electric cars and is a moulded tire of lighter construction than the older models.

More Taxicabs for Indianapolis.



The Severin Taxicab & Garage Co., with a capitalization of $100,000, is in process of formation in Indianapolis, Ind. The promoters are Harry G. Gates, Richard H. McClellan, Charles A. Bookwalter, Frank H. George and Cassius C. Hadley. The company is the outgrowth of the desire of some of the members of the Severin Hotel Co. to have an up-to-date taxicab service connected with that establishment; the business, however, will be more comprehensive, and a garage will be erected near the hotel with a storage space for 100 cars. Twenty-five taxicabs will be operated.

Warren Property Returned to Receiver.

Because of the legal knots which developed afterthe Warren Motor Car Co.'s plant in Detroit had been sold by the receiver to W. C. Rands, of the Rands Mfg. Co., which were sufficient to cause the court to withhold its approval, the property has been turned back to the receiver, the Detroit Trust Co., and is now in its hands. It probably will again be offered at public sale but this is not likely to occur for five weeks or more.

In the RETAIL WORLD

M Bower is building a garage in Bayard, Iowa.

F B. Moore, of Tulare, Cal., will open a garage on Kern street.

Smith & Ramsey, of Van Wert, Iowa, are erecting a new garage.

J F Houchins, of Hallettsville, Tex., is having a new garage erected.

A. O. Merrill is erecting a one-story garage, 48 x 50 feet, in Flaxton, N. D.

Clifford Bevington has opened a garage in Richmond, Ind., on North 8th street.

The Bellaire (W. Va.) Automobile Association has completed a new garage.

Yaeger Hill, of Smithville, Tex. has awarded the contract for a new garage.

Nathan Haywood, of St. David's, Pa., has commenced the erection of a new garage.

The Maroa Mfg. Co., of Bloomington, Ill., plans to open an automobile repair-shop.

Frank Crawford, of Omaha, Neb., is about to erect a garage on Farnam street.

The Wilmington (Del.) Automobile Co. will erect a new garage. It will cost $4,000.

F J. Haney is about to erect a garage in Evansville, Ind. The site is on upper First street.

Hannan & Henry have opened a garage in Plattsburg, N. Y. It stands on Margaret street.

C H. Nelson has opened a garage in Pittsfield, Ill. He also has an automobile agency.

Edmund Batson, of St. John, N. B., has secured plans for a garage; he will build on Duke street.

Dorsey & Holland have entered the trade in McRae, Ga. Their establisment is styled City Garage.

The Campbell Machine Co., of San Diego, Cal., is building a new garage on Cedar street.

Benjamin Colton, of Osage, Ia., is about to erect a garage; he will build at 8th and Main streets.

Herman Ahlers, of Brooklyn, N. Y., plans to erect a garage at 210 Lewis avenue; it will cost $8,000.

Frank Eberley heads a company which plans to erect a garage, 50 x 130 feet, in Wahpeton, N. D.

William H. Parkinson, of Waltham, Mass., has opened a garage; it is located on Lexington street.

G. S. Schrim, of Pasadena, Cal., has awarded the contracts for a new garage on Huntington drive.

The Union Motor Car Co., of Tacoma, Wash., has opened a new garage. It stands at 808-810 A street.

T. J. Wilson, of Ocean Beach, Cal., has taken over a garage in San Diego; it is located on First street.

R. Foster Bray, of Bangor, Me., has taken over the garage of S. E. Teel; it is located on North First street.

Henry Sisson and Fred Brown, of Lake George, N. Y., have formed a partnership and will operate a garage.

The Alameda (Cal.) Vulcanizing Works has opened a repair and vulcanizing works; the location is on Oak street.

I W. Phillips has entered the trade in Orlando, Fla. He has purchased and will operate a garage on Pine street.

Arthur R. Norton will erect a garage and repair-shop in Farmington, Me. He has purchased a site on Main street.

H. A. Dyckman, of Stamford, N. Y., is erecting a new garage; it will stand at the rear of the Van Winkle Theater.

William Elerbeck, of Beatrice, Neb., has disposed of his automobile and implement business to Foster & Langworthy.

A stone, fireproof garage is to be constructed in Wynnewood, Pa., for Charles Watkins. The cost will be $5,000.

The Bertram Motor Supply Co., of Salt Lake City, is preparing to open a branch at 224 South Main street, Butte, Mont.

Charles L. Rochelle, of Derry, N. H., a cigar manufacturer, has branched out; he has taken the agency for Metz cars.

Ray Cleveland, of Albany, Minn., has disposed of his livery business to C. B. Quale. Cleveland retains his automobile agency.

L. L. Tyler is about to erect a garage in Yankton, N. D. He is Reo and Ford dealer. The garage will stand on Douglas avenue.

A new garage is to replace the one now occupied in Hillsdale, Mich., by J. Lewis, on Railroad street. The building will cost $3,000.

W. T. Bender and F. T. Moore have opened a new garage in Visalia, Cal. It stands on E street and is styled the B. & M. Garage.

Charles Hellie and Louis Henderson, of Albert Lea, Minn., have opened a garage. It is located at Washington and main streets.

The Buick Motor Co., of Brooklyn, N. Y., has opened new salesrooms at 358 Livingston street; the service station remains at 475 Hudson avenue.

John Dunlap has opened a garage in Dallas, Tex., on Holmes street, between Grand and Sanger avenues; free air is a feature of his service.

H. H. Moody, of Peoria, Ill., has secured plans for a three-story brick sales building, to stand on Main street. It will represent an expenditure of $8,000.

Plans have been prepared for a three-story garage to be erected in Montgomery, Ala., for Cook & Laurie. It will be of steel and frame construction.

Brown & Bosworth, of Lewiston, Me., have leased the Ferguson Livery Stable and will convert it into a garage; a full machine shop equipment will be installed.

W. D. and Logan Smiley, of Ladysmith, Wis., plan to open a garage and repair-shop on Miner avenue. They are having a building remodeled for this purpose.

John Christenson & Co., automobile and motorcycle dealers in Galveston, Tex., plan the erection of a 12-story building on Tremont street. It will cost $750,000.

The F. G Maas Co., of Clinton, Iowa, is about to open a new place of business at Sixth avenue and Second street; the company is a garage operator and dealer.

G. H. Obermeyer, a garage man in Duluth, Minn., has become a dealer; he has secured the Cartercar agency and will handle it from his garage on Second avenue, West.

L. C. Merchant and others, of San Antonio, Tex., are about to enter the trade in Bishop, in the same state; a building is being erected on Fourth avenue, in which they will open a garage.

Bunker & Reopell, of Springfield, Mass., who handle Little cars, have taken possession of a new garage and sales building on upper State street. They formerly were located on Port street.

Digitized by Google

Charles R. Johnson, formerly with the Bates-Odenbrett Automobile Co. of Milwaukee, Wis., has entered the trade for himself; he has the White line.

The firm Paquet & Pack, of Portland, Ore., has been dissolved. J. A. Paquet, however, will remain in the automobile business, acting as distributer for Oregon of the Haynes line.

Frank Fleming, formerly with an express company in Salina, Kan., has entered the automobile trade on his own account. He has opened a garage and repair-shop in Rosedale, in the same State.

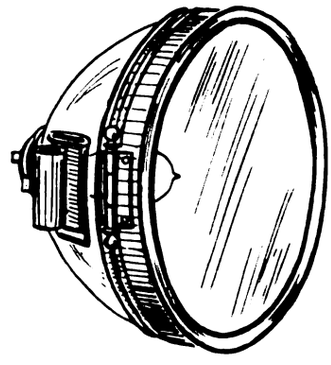
George P. Sweet has purchased the Orleans Motor Car Co., in Beaumont, Tex. He formerly operated the Beaumont Motor Car Co. Besides storing and repairing cars he will carry a full line of accessories.

A. Hammer, who has been engaged in repair work in a small way in Modesto, Cal., is to have a real repair-shop, 50x50 feet; a sheet iron structure is being erected for him on 13th street, between H and I streets.

Guy L. Smith, of Omaha, Neb., is soon to occupy a new fireproof building of three stories and basement at 26th and Farnam streets; the building is 66x132 feet, with a total floor space of 35,500 feet. Smith is a Franklin dealer.

Walter W. Stryker, former manager of the Service Motor Car Co.'s branch in Plainfield, N. J., has taken over that establishment and hereafter will conduct it under the style Stryker Motor Car Co. Overland and Abbott-Detroit cars will be handled.

Joseph Atherton has disposed of the M. & A. Garage, in Macomb, Ill., to D. F. Pierce; Atherton and John McDonald started the business a year ago and later took over the Stocker Garage, where the business since has been conducted. Atherton recently bought out his partner.



L. K. Bronson, secretary of the Oshkosh (Wis.) Chamber of Commerce, has resigned that office to engage in the automobile business in that city. He has acquired an interest in the Philip W. Stocum establishment at 43 Cheape street, which hereafter will be conducted under the style Stocum-Bronson Auto Co.

The Knickbocker Garage, 150 x 66 feet, has been opened in Binghamton, N. Y., at Wall and Henry streets. The equipment includes an air compressor and tank, two wash racks in the basement, with a 300-gallon hot water tank, and curb air and fuel connections. The space will accommodate 76 cars. The garage utilizes the ground floor and basement of a new $50,000 three-story structure, of which the second floor is to be a skating rink and the third a convention hall. Knickerbocker, the owner of the business, is a Henderson dealer.

RADICAL IDEA IN LAMPS; HERE'S ONE ALL GLASS

Vacuum Bottle Construction Prevents Heat Radiation—Transparent Protection for Colors—Stand Up Well Under Vibration.

At the present moment there is uncommon activity in the world of lamps, and it would seem that every fault that a lamp ever had has been seized upon and either eliminated or mitigated in some form or other of lighting device. But while all sorts of ingenious ideas have been put into material form, and various materials have been pressed into the service, the Reynolds-Browne Co., of 1722 National Bank Building, Chicago, has capped the climax by bringing out a lamp that has a body made

ARBECO GLASS LAMP

wholly of glass, to say nothing of the glass parabolic reflector, and is made on the principle of the vacuum bottle in that there is a vacuum between the reflector and the lamp body.

The general appearance of the lamp is that of an up-to-date affair of the bullet type. The glass body is finished, on the inner surface, in any color desired, which may be the color of the car or brass, gold, nickel, copper, etc. Obviously the finish is protected and cannot dull or tarnish, so that wiping off the outside with a damp cloth is all that is necessary to keep the lamp looking its best. The reflector is a truly molded parabola with the silvering on the outside—that is, the surface furthest from the bulb—and is as easily cleaned as the body. A hose can be turned on the lamp without injuring it.

In the space that is left between the reflector and the body, which are connected in the same general way as the two parts of a vacuum bottle, there is a vacuum which serves more than one purpose. It preserves the finish of the body and the silvering of the reflector indefinitely, and it prevents the interior of the lamp from heating under the rays of the sun and the exterior from becoming hot from the radiated heat of the electric bulb which is the source of illumination.

While it might be assumed offhand that a glass lamp would be easily broken, the manufacturers state that tests made on cars running under all sorts of conditions, including rough, bumpy roads, indicate that there is no fear of breakage from vibration. The "Arbeco" lamps, as they are called, weigh from one to three pounds less than metal lamps.

Apple Claims First Two-in-One Lamp.

"In Motor World of July 3rd we note an editorial regarding the doing away with side lights, and adopting the method of dimming the headlights so that the one lamp answers the purpose of two," writes the Apple Electric Co., of Dayton, Ohio. "In this connection it might be interesting to you to know that the Apple Electric Company were the first to bring out this feature in January, 1910. In our bulletin No. 14 of that date a price was quoted for adding this feature to electric headlights. The plan was to place a small lamp at the outer edge of the reflector so that it would be out of focus, and a single turn of the switch would shut off the larger lamp in the back of the reflector and switch on the smaller one in front.

"This feature has been later covered by the dimming of the headlights accomplished through the Aplco controller. A feature which does not seem to have been entirely covered in Motor World's editorial, is that in case of the burning out of the regular lamp bulbs in the headlights, the small bulbs could still be used, which would protect the owner against arrest on account of not having the lamps lighted. This, of course, would only apply in case the two bulb headlights were adopted in place of the sidelights."

Glaring Head-Lamps Banned in Chicago.

Chicago is not as bright as it was a week ago. For on Thursday last an ordinance banning glaring head-lamps went into effect and those who use them now are liable to arrest and upon conviction to a fine of from $5 to $50 for every offence. According to the ordinance, which is similar to one in force in New York City and in other large municipalities, "it shall be unlawful . . . within the city limits to use any acetylene, electric or other bright headlight, or any headlight the rays from which shall be intensified by any parabolic or condensing lens in front of the light, unless such headlight shall be properly shaded, so as not to blind or dazzle other users of the highway or make it difficult or unsafe for them to ride, drive or walk thereon."

NEW YORK, JULY 10, 1913

THE TWO TYPES OF GARAGES.

It is at this season of each successive year that garages automatically divide themselves into two classes—those that treat transients fairly and those that treat them the other way. The touring season is at its height, which means that the transient is very numerously abroad in the land. The unfair class of garageman looks upon him as legitimate prey; he reckons that he will never see him again and acts accordingly.

In many instances, the unfair treatment takes the form of petty overcharges; in others, slop work; in some cases, both. Slop work usually consists in giving the tourist's car the proverbial "lick and promise" instead of proper washing and polishing. The overcharging is usually practiced in the sale of oil or accessories. If the tourist protests, the over-shrewd garageman has ready a mouthful of excuses, which he terms explanations, though he as often sticks his tongue in his cheek after uttering them.

This sort of garageman is the sort that does not look beyond the moment; he is simply "after all the money that's floating 'round" and gets it, no matter how. It is rare indeed that he is pleasantly remembered or favorably recommended by the transient who falls into his clutches. It is almost unbelievable, but it is a fact, that one garageman in this class once used a feather duster on a tourist's car, and when complaint was made at its condition, offered all manner of "apology" for his help—but he charged for washing, just the same.

The other sort of garageman not only values his own reputation but realizes the value of a traveler's good-will; he treats the tourist as he would treat a regular customer. If fault is found and complaint made, he does not have recourse to excuses or apologies. He either has the work properly done or he refunds the money. He is reasonably certain that when the tourist leaves his premises he will return if ever he is in the vicinity, or, if not, that his, the garageman's, name and fair treatment is sure to be remembered and remarked wherever tourists may congregate. This sort of garageman, like the better class of hotel keeper, realizes keenly the far-reaching nature of verbal advertising given by satisfied customers.

Occasionally the unfair treatment is accorded by subordinates, and without the knowledge of the garage owner himself. The result, however, is the same. It will profit not a few garagemen to keep their eyes open or make inquiry, or otherwise discover, how tourists are treated in their particular establishments. For their treatment often is a very essential factor in the success of a garage.

HAS THE EPIDEMIC ABATED?

It has been said that of the organization of automobile companies there is no end, and certainly the weekly record of incorporations for practically a decade has served to make appear that there is truth in the saying. For years it has been a poor week when charters for approximately 100 automobile enterprises have not been issued, even if many of them never reached beyond the "paper" stage; no other industry has been able to compare even mildly with the automobile trade in this respect. It may be the effects of the heated term or may imply that the epidemic for such enterprises has abated, or, possibly, it contains no significance, but it is nevertheless so remarkable as to merit comment that during the last month the record of automobile incorporations has fallen off in a manner that is not short of astounding. The lawyers, at least, must be feeling the pinch.

It would be interesting to discover how the average Secretary of State busied himself before automobile registration bureaus were created and attached to his office. Whatever they may have done, it is certain that the public rarely heard of either the men or their work. Nowadays, however, with an automobile bureau under his wing, he is a poor Secretary of State who cannot interview himself, or have himself interviewed, at least once a week, on the subject of automobile regulation, and thus keep himself in the limelight. In this respect, the automobile has been almost a godsend to many otherwise obscure or sadly neglected "statesmen."

They certainly do run real road races on the Pacific Coast. The Vanderbilt, Grand Prize, Elgin and other so-called "classics" are parlor affairs compared with the Los Angeles-Phoenix and Los Angeles-Sacramento events.

COOPER TAKES LION'S SHARE AT TACOMA'S BIG CARNIVAL

Stutz Pilot Accounts for the Two Long Races, Averaging Sixty-eight Miles per Hour — Burman Goes into Ditch.

Earl Cooper, in a Stutz car, gathered most of the laurels that were gatherable at the two-day speed carnival which was run in connection with the Montamara Festo, or "Feast of the Mountain," carnival at Tacoma, Wash., on Saturday, July 5th, and Monday, July 7th. Cooper not only won the feature event of the first day— a 200-mile Potlatch trophy race for cars under 600 cubic inches, which netted him $1,800 in cold cash, but he also won the big race of the meet, the 250-mile free-for-all which was to have been run on Sunday, July 6th, but which was postponed to the following day because of inclement weather.

The latter event, styled the Montmarathon, brought the victor $2,500. The lesser contest, termed the Intercity Century, went, as its designation implies, for 100 miles and proved a victory for Parsons, who also drove a Stutz.

The weather on the first day of the meet left very much to be desired. While it did not rain continually, the several short but severe showers rendered "sloppy" the 3½-mile circuit, which was laid out on the prairie on the outskirts of Tacoma. The wetness, however, though it tried the skill of the drivers and limited the speed of the machines, failed to dampen the spirits of the very many spectators who lined the course.

The Intercity Century was the curtain raiser and was run on Saturday morning. The contest was given a true Northwestern flavor by virtue of the fact that the entries were limited to those who had resided either in Washington, Oregon, Idaho, Montana, British Columbia or Alberta for at least three months prior to July 4th. But eight lined up for the start. Parsons completed the distance in 1:33:53, and was followed home by Cameron, also in a Stutz, who finished nearly three minutes later. Houson (Hudson) and Lebold (Buick) took third and fourth places, respectively, the other four contenders having been put out of the running.

The double century for cars under 600 cubic inches occupied Saturday afternoon. Seven lined up for the start of this contest, and of the number four failed to cross the finish line. Cooper early took the lead, but Burman in the Keeton made the keeping of it a pretty problem. For the first 26 laps it was a case of see-saw between the Stutz pilot and the driver of the Keeton. On the 26th lap, however, Burman came off second best in a brush when challenged by Teddy Tetzlaff in a Fiat and went into the ditch. He lost but little time in effecting necessary repairs and finished the race on three cylinders, but the accident lost him even a fighting chance for first money. Cooper crossed the tape in 2:49:32, and Burman limped into second place in 3:05:40. Latta (Interstate) was the only other contender to finish.

The course was in better condition for the Montamarathon free-for-all on Monday. Eleven contenders started in the grind, and of the number but three finished, although three were still running when the race was called. Cooper made the distance in 3:32:08, or at an average rate of 68:4 miles an hour for the 250 miles. Second in was Lewis in a Fiat, who crossed the tape slightly less than three minutes after the winner. Third place went to Hughes (Tulsa); his time was 3:39:55. Endicott (Endicott special), Hanson (Hudson special) and Nichols (Apperson) were flagged while on the 56th lap.

Both Cooper's Stutz and Lewis's Fiat were equipped with Bosch magnetos and plugs, while the Tulsa was sparked by a Bosch magneto. The Endicott special was Remy equipped, with Bosch plugs in the cylinders. The summary:

Saturday, July 5th.

102.1 miles, Intercity Century, for cars under 450 cubic inches—Won by Parsons (Stutz); time, 1:33:53; second, Cameron (Stutz); time, 1:36:36⅘; third, Hanson (Hudson); time, 1:51:16; fourth, Lebold (Buick); time, 2:12:59⅗.

200 miles, Potlatch trophy, for cars under 600 cubic inches—Won by Cooper (Stutz); time, 2:49:32; second, Burman (Keeton); time, 3:05:40; third, Latta (Interstate); time, 3:10:28.

Monday, July 7th.

250 miles, Montamarathon, free-for-all—Won by Cooper (Stutz); time, 3:32:08; second, Lewis (Fiat); time, 3:35:00⅕; third, Hughes (Tulsa); time, 3:30:55. Endicott (Endicott special), Hanson (Hudson special) and Nichols (Apperson) flagged on 56th lap.

Here's Well-Tarred Yarn from Abroad.

A foreign genius who "has it in" for the people who spread tar on the roads with a view to their improvement has — so the story runs—fitted scrapers to each wheel, which catch the tar that sticks to the tires and drops it into tanks, whence it is removed, and—climax—the genius expects to distil the stuff and make motor spirit out of it, with which to drive the car to gather more tar to make more spirit, to drive the car, etc.

VERBECK THE VICTOR IN DAY AND NIGHT ROAD RACE

Defeats Nearly Fifty Starters, but is Protested by College Boy Who, in $50 Used Car, Finishes Second —Los Angeles-Sacramento Event Proves Thriller.

Winding mountain passes and roads skirting yawning canyons scarcely can be construed as an inviting automobile race course. Yet 443 miles of roadway in which that sort of thing obtains, to say nothing of deep sand or ordinary roughness, and which connects Los Angeles in Southern California to Sacramento in the northern part of the State, formed the course over which the daredevils guided motor cars of all descriptions, from the well-tuned-up racing car to a nondescript "plugger" in a race which was staged Friday and Saturday last, July 4th and 5th. It was a road race being the term.

And though the way was narrow and hilly and tortuous, and despite the number of contenders and despite also the fact that the race began at midnight on the Glorious Fourth, the winner of the Panama-Pacific contest, as it was called—Frank Verbeck, who drove one of the Fiat racers from the shop of E. E. Hewlett—made time, which was not indeed wonderful, was at least unexpected.

Frank Verbeck, who was supplemented at the wheel on occasion by Harry Ham, covered the 443.6 miles in 11 hours 1 minute and 16 seconds, or at the rate of 39.96 miles an hour. Although nine others had preceded him, corrected time gave second place to Ed. Waterman in a Buick, who circled the race track in Sacramento for the concluding flourish and brought up at the finish just 20 minutes and 9 seconds later than the winner; third position was captured by Barney Oldfield, also at the wheel of a Fiat; he finished a little over a minute later than Waterman. Charles Soules (Cadillac), W. H. Carlson, Jr. (Alco) and J. Fleming (Pope-Hartford) finished in the order named.

It is possible, however, that Verbeck's reign over his victory will be short lived, for a protest was filed by Waterman, the second man, upon the grounds that Verbeck did not stop at Fresno, one of the checking stations. The matter, of course, will have to be thrashed out by the contest board of the three A's.

The first entrant, Charles Soules in a Cadillac, was sent away from Los Angeles at midnight on the "Fourth," and at two-minute intervals the others followed in this order:

1 Soules, Cadillac	26 Jackson, Reo
2 McKee, Cadillac	27 Davis, Chalmers
3 Faulkner, Simplex	28 Kerrigan, Simplex
4 Bramlett, Apperson	29 Stitt, National
5 Toft, Simplex	30 Carlson, Alco
6 Pink, Cole	31 Hanshue, Apperson
7 Oldfield, Fiat	32 Bancroft, National
8 Verbeck, Fiat	33 Williams, Pullman
9 Beaudet, Cadillac	34 Bruce, Michigan
10 Morris, Mercer	35 Zacharias, Chalmers
11 Leach, Macomber	36 Cody, Stearns
12 Raymond, Mercer	37 Gage, Welsh.
13 Daniels, Locomobile	38 Siefert, Stutz
14 McKelvey, Overland	39 Wherrit, Mercer
15 Ruckstell, Mercer	40 Quinn, Stutz
16 Monroe, Touraine	41 Schnack, Ford
17 Rapp, Simplex	42 Powers, Stutz
18 L. Nikrent, Buick	43 Waterman, Buick
19 Mitchell, National	44 Draper, Metz
20 Stearns, Kissel	45 Fleming, Pope - Hartford
21 Swanson, National	
22 Kapuczin, Winton	46 Brown, Knox
23 Gochenouer, Moon	47 Devore, Stutz
24 Cassin, National	48 Giddings, American
25 McConner, Lancia	

The only one of the 49 entered who did not start was Dominic Basso, driver of the Alco which twice won the Vanderbilt Cup race, who had wrecked the car and nearly killed himself when he collided with a farm wagon in practice the day before the race.

At Bakersfield, the first checking station, Soules, first away, was still in the lead coming in at 4:24, and seven minutes later Verbeck came in, having passed seven contenders and made up 11 minutes' time on the first car. Oldfield followed and T. J. Beaudet and Omar Toft in a Cadillac and Simplex respectively were the next contenders to check in Bakersfield.

Soules was leading by nine minutes at Fresno, the second station, which he entered at 7:12, with Verbeck, Oldfield, Toft and Beaudet following in that order. After leaving Fresno, however, things changed. Before the 45 miles between Fresno and Merced had been covered Verbeck had passed Soules, and he arrived at the last-named place five minutes ahead of the Cadillac driver.

Having assumed the lead, Verbeck never was displaced, nor was the order of the leaders changed. Verbeck finished at 11:17:16 on the morning of the 5th, and was followed by Soules in the Cadillac 8 minutes later. Oldfield finished third and Toft fourth. Waterman (Buick), who on corrected time was second, finished tenth.

The time corrected, the first 18 contenders finished as follows:

No. Driver and Car.	Time.
1—Verbeck, Fiat	11:01:16
2—Ed Waterman, Buick	11:21:25
3—Barney Oldfield, Fiat	11:22:53
4—C. Soules, Cadillac	11:26:16
5—W. H. Carlson, Jr., Alco	11:28:03
6—J. Fleming, Pope-Hartford	11:28:20
7—Bancroft, National	11:35:52
8—Toft, Simplex	11:39:32
9—Hanshue, Apperson	11:56:30
10—Beaudet, Cadillac	11:57:31
11—Faulkner, Simplex	12:03:50
12—Briscoe, National	12:03:55
13—Schnack, Ford	12:27:44
14—McKelvey, Overland	12:44:12
15—Siefert, Stutz	12:46:53
16—Nikrent, Buick	12:47:34
17—Morris, Mercer	13:14:48
18—Kern, Kissel	13:16:56

Verbeck, provided he is not disqualified, will receive $5,000 and Waterman $2,500. The other awards are: Third, $1,250; fourth, $750; fifth, $625; sixth, $575; seventh, $525; eighth, $475; ninth, $425; tenth, $375.

One of the surprises of the race was Waterman's Buick. The car was not a racing machine. Waterman, who is a college student, claims to have bought it from a livery service man after it had done considerable duty, the purchase price being $50, and put it into trim himself.

Not an accident marred the contest, although Beaudet on two occasions supplied "fireworks" when the underpan of his Cadillac took fire from backfires in the carburetter. The cars of Verbeck, Waterman and Oldfield were Firestone-tired.

Dunnivan Repeats Last Year's Performance.

After several unsuccessful attempts to hold unsanctioned racemeets in various parts of the country, all of which were effectually blocked by the American Automobile Association, C. V. Dunnivan, already "in bad" with the sports governing body for previous offenses, succeeded in inducing a number of local amateur drivers to race against himself and themselves at Memphis, Tenn., on July 4th, and he managed the race so well that he came out the winner in the end.

Dunnivan's performance is virtually a duplication of what he did last year at the Tennessee State Fair Grounds track, when one of the participants was killed in a similar race; this year, however, the race was held on the North Memphis Driving Park track and, as was the case last year, one of the drivers was killed and several other persons were badly injured. Dunnivan's time for the race—he drove a Studebaker—was 3:15:00, and he finished five miles ahead of Aubrey Clapp in a Velie, who was the only other man of the 11 starters to finish the 100 miles.

The accident which resulted fatally occurred in the 51st mile and was due almost entirely to the poor condition of the track and the great clouds of dust that were thrown up. Driving a Marmon car, Don Grant was blinded by the dust as he came down the stretch in front of the grandstand and he crashed into a Chalmers car undergoing repairs at the hands of its driver, C. B. Jones. Grant was thrown out and so badly injured that he died later; both Jones and John Harp, Grants' mechanician, also were seriously hurt. The names of the other starters and the number of laps they made before retiring are as follows: J. B. Cook (Chalmers) 69, Chas. Grogan (Studebaker) 54, E. Boggs (Studebaker) 52, Don Grant (Marmon) 50, J. D. Whitehead (Buick) 33, Jack Bobo (Ford) 22, O. L. Stewart (American) 18, Joe Robinson (Speedwell) 15, Paul Robbins (Chalmers) 13 miles.

USES OF MONTHLY INVENTORY

Far-Reaching Purposes Which it Serves and Guesswork Which is Avoided—Investments that May Represent a Steady Loss.

It is mighty good business to have a monthly inventory of the contents of the stock room, as odds and ends accumulate rapidly. Everything in the stockroom represents an investment. It is easy to have that investment far too heavy for the size of the business. It is easy to have that investment represent a steady loss. The way to avoid the loss is by looking sharply after the stock and having everybody in your employ know that you are keeping close tab on it. If your employees know that you are on the alert they will act accordingly.

How much of the stock in the stockroom is live stuff? How much of it is junk? Do you have a careful record of the material that goes in and out? Do you positively **know** that you are getting your money out of it? If not, a monthly inventory enables you to keep track of the stuff that is moving and will help you give decidedly better service to your customers, which is nothing more or less than saying that you are building up a better business for yourself.

Memory Plays Scurvy Tricks.

Do you have separate compartments for stuff that belongs to your customers? When an old shoe is left, is it properly tagged? Do you go over this "customers' junk" at regular intervals and notify the customer just what you have that belongs to him and suggest as diplomatically as may be that he remove it?

Memory is a fickle thing; a man thinks he left a good tire and later finds it was almost worn out. Three months have passed since he saw it. When you roll out that old casing for him he thinks you are trying to "put one over"; that is why one dealer inaugurated the plan of a monthly clean-up linked with cards tagged on every piece of "customer's property," indicating the date it was left and the condition of each article when left.

THE ONLY WAY TO PROMOTE THE SALE OF ACCESSORIES

There is money in selling electric horns; there is money in selling tire patches, blowout reinforcements, spark plugs and every accessory commonly in demand by motorists. And the wise, aggressive dealer is not overlooking the money to be made by installing electric lighting devices and selling storage batteries to those whose cars are not so equipped. There are any number of such cars, and while you cannot equip all of them you can equip some.

The way to make money in selling these articles, however, is to handle them as a regular department of your business. They should not be kept in an out-of-the-way stockroom to be shown only when a customer asks for them. Their place is in the show-room, or in a neat, attractive showcase in the garage, where they will be constantly seen by customers coming in and going out.

Selling Accessories by Suggestion.

There is an element of suggestion in the proper display of accessories that helps them sell themselves. People seeing an electric horn, for example, all ready for attachment, in your show-case, are sure to ask the price—and then it only requires good salesmanship to turn that into an order for the horn. "I can attach it right now if you wish," will close more than one sale when the customer is in a state of hesitancy.

"Out of sight, out of mind," is true about accessories—and you will never push them until you make them a real part of your business and display them properly. But when that day comes you will find them a powerful force for reducing overhead and increasing profits.

SHOW WINDOW BREAKAGE THAT PROVED ITS CLEANLINESS

Keep your windows clean. This is one of the elementary principles in window display that everybody can carry out, and the more thoroughly it is done the more effective will be the showing of whatever is in those windows. This has been preached before and will probably be repeated many times more because dusty or otherwise dirty windows are still to be seen here and there. Walk down the street of any town or city and you will be amazed to note the appealing influence of a bright, clean window.

Once in a while—but not very often—this sort of cleanliness may prove a source of trouble, as was recently instanced by an accident that happened to one of the windows of the Maxwell Motor Co.'s salesroom in Detroit, which is situated at the southwest corner of Woodward and Warren avenues, at the junction of the Woodward and Crosstown lines. The colored porter keeps these windows so immaculate that the glass is scarcely apparent. You see through the windows—you do not see the glass. In proof of this, a passenger on the Woodward car who was in a hurry to catch a "crosstown" walked right through the window before he realized that it was there. He was sober, too, and could only explain his action by saying that the windows were so clean and clear that he didn't see them, and as a matter of fact he thought they had not been put in place yet!

What are you working for? Whom are you working for? Do you know? If you are just making expenses, is it worth while? Make profits—not just expenses. Get the big idea—believe in yourself and your opportunities. Work—and work scientifically; don't guess—**know.**

LESSENING ONE'S TROUBLES

Taking Reasonable View of Service Problem One Way of Doing so—Logic that Appealed to Near-Irate Customer.

The Ford Motor Co.'s Detroit branch believes in "service" and gives it to customers in no uncertain fashion. Their service station is kept open day and night, but they do not regard it as necessary to have the office and salesroom and repair department open at all hours. At six o'clock the office closes, and the employes of the repair department quit at the same hour as those in the factory.

This plan makes life worth living and keeps the men in better shape to tackle the problems of each day. Because a man sells automobiles it is no reason he should live the life of a drug clerk and be on the job 18 hours a day. This idea of doing business in business hours seems strange to those accustomed to the "day and night service" talk, but its reasonableness is so apparent that customers rarely object.

Skeptical Customer Convinced.

"Sitting here the other night, about six o'clock," said Manager Ryan in discussing the subject, "the telephone rang and someone on the line said his car would not run; would we send down and get it? I explained to him very politely that we closed at 5:30, and that the best thing for him to do was to have a near-by garage get it and store it for the night and we would call for it at eight in the morning. 'Is that what you call service?' asked the man, and he proceeded to tell me what he thought of it. 'Wait a minute,' said I. 'If you wanted a loaf of bread at ten o'clock at night and went down to the grocery and found the man in bed you wouldn't be annoyed, would you?' He allowed that he wouldn't, but insisted that an automobile was different from a loaf of bread. But it only took a few moments' conversation to have him get the point, and when I once more explained that at eight in the morning we would call for his car and give it instant attention he was satisfied that, after all, we were doing business in a business way and that our service was just as real as we said it was."

All of which goes to illustrate the point that your troubles can be minimized if you follow a logical plan and are always very much what you choose to make them. A night trouble-force costs very much more to maintain than ever can be extracted from it by the very finest kind of bookkeeping and financing. Common sense dictates that it pays to keep the service idea within reasonable lengths.

WHEN TOO NUMEROUS DISPLAYS CREATE WRONG IMPRESSIONS

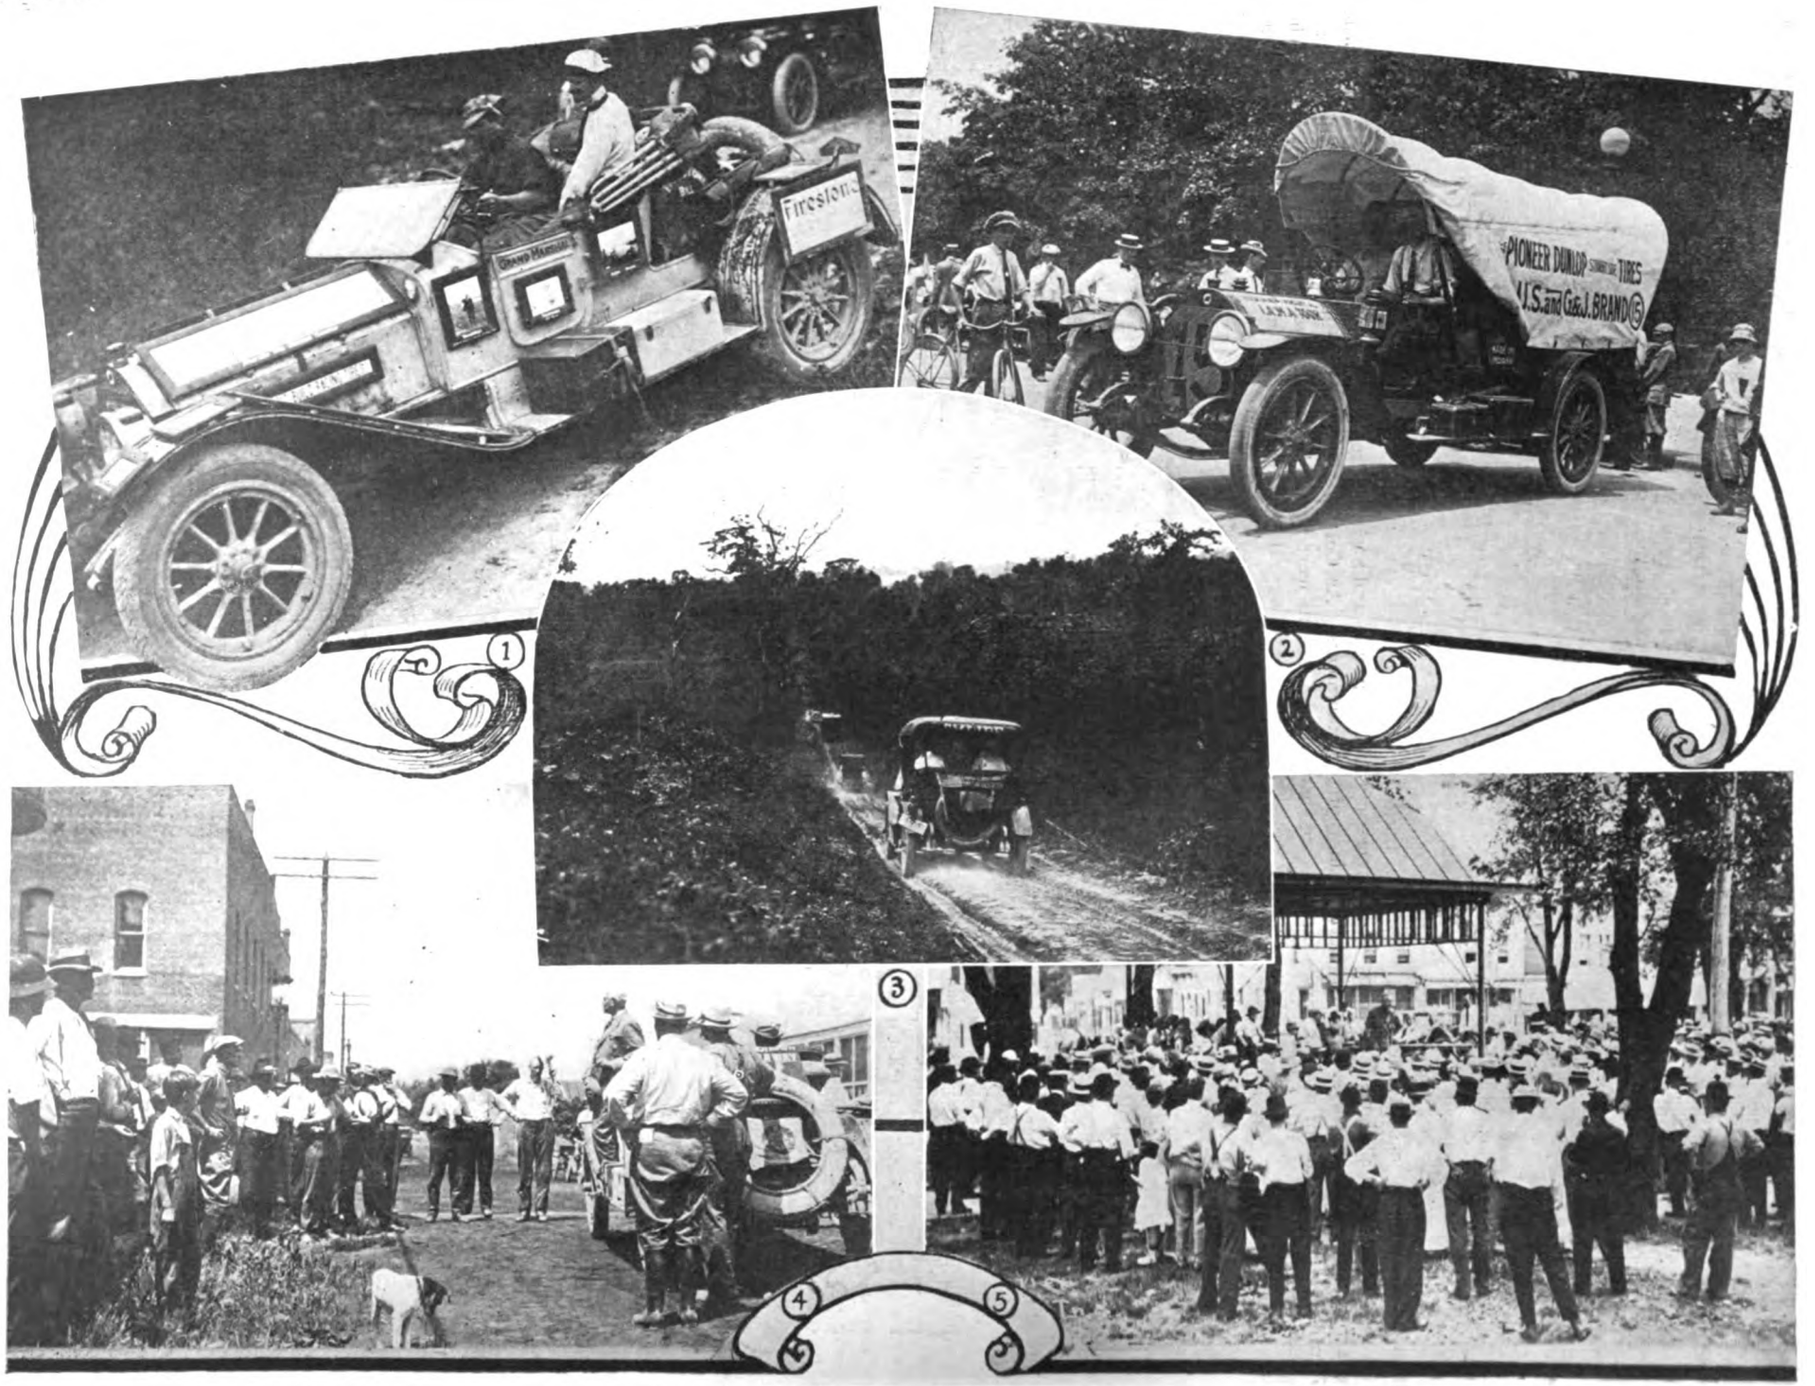
"A showroom should never be loaded with cars," is the view of A. K. McLuney, manager of the Studebaker branch in Detroit, on that always interesting subject. "A showroom full of cars gives the impression that sales are slow and that plenty of cars are on hand, and that the cars you sell are unpopular; a few cars properly placed create a better impression. But these cars should not be allowed to remain in the same position more than three, or at the most five, days. Change them about often, giving a front, then a side, and later a rear view of each car, and rearrange them constantly.

"At least once a week all the cars, save one, perhaps, should be removed into the garage or another part of the premises, and just as often as possible a new car displayed. The psychological effect of all this upon the minds of the public in general will be appreciated by every dealer who understands human nature.

"The constant evidence that you are doing business, that cars are moving fast, that the demand is much greater than the supply, creates interest and excitement—causes talk in the entire community and increases the demand for that product. People are generally anxious to secure what is hard to get, and especially is this true of cars."

SELF-STUDY AS A MEANS OF ASSISTING SALESMANSHIP

Any course of reading or study or any system that helps a man to better and clearer thinking, that gives him better understanding of other men, or in any way adds to his stock of useful knowledge, will make that man a better salesman.



The part that character and personality plays in salesmanship is often underestimated and often not understood at all. It will be more clearly and definitely understood in the future. The men will realize that it pays big dividends to foster and develop character. They will realize that it is possible, by patience and watching and study, to develop a strong, well-balanced personality.

"I am what I am" holds no place in the philosophy of the modern salesman. He realizes that if he is not at present the kind of man he wants to be it is possible to build and develop the qualities that are lacking. He sets for himself a standard of measurement that includes all those qualities he knows will make him a more efficient salesman and frequently applies the measure to himself to ascertain where he is lacking. If he is in earnest he does not skip here and there, but resolutely and candidly seeks for the facts about himself—he knows that growth and development do not come by accident but by intention. And he knows that just as surely as the plant placed in the right soil and cultivated carefully will develop growth and strength so it is with a cultivated personality.

Brains and personality are worth more than money. What are you doing to develop both?

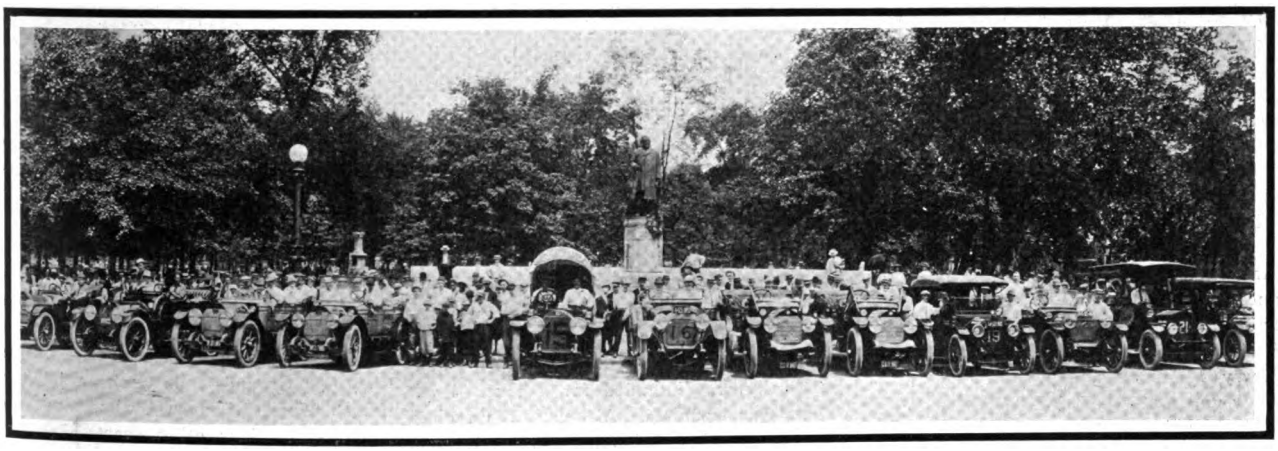
SOME PICTURESQUE FEATURES OF THE "BOOSTING INDIANA" CROSS-CONTINENT TOUR

1—FIRESTONE CAR. 2—G & J "PRAIRIE SCHOONER." 3—DEEP IN THE WOODS. 4 AND 5—"BOOSTING INDIANA" EN ROUTE

Digitized by Google

THREE STATES CROSSED BY "MADE-IN-INDIANA" TOUR



And Much Entertainment and More Dust is Encountered in the Crossing—Spat at One Time that Threatened Trouble.

With the dust of three States behind it, and the makings of a fine little spat tucked away in its waistcoat pocket, so to speak, where it won't breed trouble again, that "Made-in-Indiana" tour has reached into Colorado and to-night (Thursday) the boosters rest in Colorado Springs with just 1,297.7 miles to the credit of the 18 cars that carry the tourists, and that is one-third of the distance. By Sunday they will reach Ogden, Utah, and before the ensuing week has spent itself they will be well on the last leg of their journey to the Pacific Coast. Poor roads set the tourists back a little and caused a loss of four hours in the run to St. Louis.

So far, except for the spat already mentioned, everything has gone smoothly—except also the dust, which grits in the teeth; there has been little rain and so there has been little mud, but the eddying gusts of dust have made up for the lack of mud. The trouble that at one time threatened to grow serious was due entirely to discriminate boosting on the part of former Mayor Bookwalter of Indianapolis, and though it now has been all cleared away, it caused a lot of feeling while it lasted. Evidently, Bookwalter's regard for Carl G. Fisher and his transcontinental roadway dispelled from his mind nearly all thought of the manufacturers responsible for the tour. At any rate, in the speeches he delivers wherever a halt is made, he said so much about Fisher and so little about Indiana and Indiana-made products that long before the second day's night stopping place was reached the cloth map of the projected transcontinental highway that were attached to the sides or rears of the cars at the start, were left to curl up by the roadside. When their absence became painfully evident to Bookwalter his speeches assumed a different tenor and Indiana products got a boost according to schedule once in a while.

All along the route that has been followed, from Indianapolis to Terre Haute and then through Springfield, St. Louis, Columbia, Kansas City, Fort Riley, Ellis and Burlington, there have been smokers and dinners and theater parties and various other kinds of entertainments. At Columbia, Mo., for instance, the tourists were particularly well feted, for there were those on the reception committee who remembered that 19 years ago to the day Elwood Haynes, who is one of the party, operated a motor car for the first time in that part of the country in Columbia and that it was a car that he himself had built.

As the cars move westward burdens are being lightened in anticipation of at least a few pieces of rough going. In a great many cases suit cases and other luggage is being shipped ahead in order to make more room in the tonneaus to stretch weary leg muscles.

THE 18 CARS AND THE TOURISTS IN THE "MADE-IN-INDIANA" TOUR LINED UP BEFORE THE START

Brighton Beach Racemeet for August 9th.

With the success of its last two ventures fresh in mind, the Motor Dealers' Contest Association of New York City has definitely decided to revive automobile racing on the Brighton Beach mile track; the date for the meet has been set for August 9th. Although at first it was proposed that the meet be held either the third or fourth Saturday in July, it later was decided to change the date to permit those drivers who have entered the Galveston Beach and other meets to drive.

THREE RECORDS TO MULFORD IN 200-MILE COLUMBUS RACE

"Smiling Ralph" Wins Eight Trophies in Race that Cost Two Lives —Harry Knight Pays the Penalty.

Marked by a double fatality and three new records, the third annual 200-mile race promoted by the Columbus (Ohio) Automobile Club on the Columbus Driving Park track on the afternoon of July 4th, is likely to live long in the memories of those who saw it. Smiling Ralph Mulford, driving a Mason car, won the race, and it was he who set up the new records. Harry Knight, who in last year's 500-mile race on the Indianapolis Speedway risked his own life to save that of another, was one of those killed; his mechanician, Milton Michaelis by name, was the other.

Mulford's time for the 200 laps was 3:21:48 as against 3:28:04.50 which was the record established by Spencer Wishart in a Mercer in last year's race, when he also set up new records for both the 100- and the 150-mile marks. Mulford's times for these two distances were 1:38:49.38 and 2:28:31.55, respectively; Wishart's were 1:40:51 and 2:30:51, respectively. Harry Endicott, at the wheel of a Nyberg, was second in 3:45:55; E. Reeder in a Mercer was third in 3:47:53.65, and Ralph De Palma, also in a Mercer, was fourth in 4:00:42.1.

Mulford won his race by cool, consistent driving, in which his generalship was made plain by the fact that he finished on the same set of tires he started on; in the whole of the race he lost but 40 seconds in replenishing oil and gasolene. For the first 25 miles, Richenbacher in a Mason led the bunch, when a see-saw between him and Mulford commenced; shortly afterward,

Digitized by Google

Mulford took the lead and from then on to the finish he was not headed.

The accident which resulted in the death of Knight and the mortal injury of his mechanician occurred when Mulford was in his 175th mile. For a long time Knight, who drove a special front-drive car styled the Rovan and made in Columbus, had been having trouble and was more than 50 miles behind Mulford. It is said that he was warned by the referee not to re-enter the race because of his well-nigh hopeless position but that he disobeyed instructions and drove out onto the track. In the next round his car skidded violently on the home-stretch turn, partly turned over and spilled out both occupants in a cloud of dust almost directly in front of John Jenkins, who drove a Schacht. Jenkins swerved his car as near to the fence as he dared but was unable to clear Knight, who lay prostrate on the track. He was killed instantly. Michaelis died the following day in the hospital from a fractured skull. Jenkins's car was so badly smashed that he was forced out of the race. At about the same time, William Fritsche, who had the wheel of a Senate car, was forced out with mechanical trouble.

Of the others who started, Richenbacher in a Mason, after leading the bunch for 25 miles, was forced out, as was Madden in a Nyberg. Four of the cars that were scheduled to start failed to put in an appearance. Meneghetti's Fiat developed engine trouble in morning practice; Walker's Garford and the two Ohio cars to be driven by Harry Matthews and J. Raimey, did not show up.

For winning first place, Mulford received no fewer than eight cups in all, to say nothing of $1,500 in cash. The cups were those presented by the Chamber of Commerce, Virginia Hotel, Lang's Dye House, Butter Krust Co., Rogers Supply & Tire Co., Automobile Trades Association, Hartman Hotel, Vehicle Apron Co., and the Valley Products Co. Endicott, the second man to cross the finish wire, received $800 in gold and a cup from the North Side Chamber of Commerce.

Harry Martin Killed on Speedway.

Harry Martin, who sat beside Charles Merz all through the 500-mile race on the Indianapolis Speedway on Decoration Day and helped him to pilot his Stutz into third place, was killed on the Speedway on Thursday last, 26th ult., while driving a Stutz testing car at high speed; Frank Agan, Martin's assistant, was probably fatally injured. At the time of the accident Martin was driving the car at high speed around one of the turns when it blew out a shoe, struck the concrete retaining wall, and, rolling over, pinned both men beneath it.

DISBROW STAR PERFORMER BUT MASON ALSO TWINKLES

Former Bags Feature Event at Sioux City Meet and Latter "Cleans up" in Smaller Races—Nikrent also Shows.

Although Louis Disbrow won the "headliner" of the two days' racemeet which was staged on the mile dirt track at Sioux City, Iowa, Friday, July 4th, and Saturday, July 5th—the sweepstakes, which went for 48 miles—it was George Mason, who piloted the little Mason Special car, that bagged the lion's share of the 12 contests which comprised the two days' program. Besides winning the feature event of the first day—a free-for-all which went for 40 miles and was completed in 32:36—Mason also annexed the 16-mile race. Chandler (Mason), Disbrow (Case), Snyder (Mason) and Nikrent (Case) disposed of the remaining races carded for the first day.

On the second day Mason came out best in a 10- and 12- mile event, and when Disbrow captured the 48-mile sweepstakes in 42:35 Mason was not far behind; Disbrow also won the 12-mile handicap; he drove the Simplex to victory in both cases. Snyder and Chandler, both Mason pilots, disposed of the remainder of the program.

Because of the blue laws which are strictly enforced in Sioux City, the meet which originally was intended for a three days' affair was curtailed. Although the racing was tame, a few thrills were aroused when Nikrent, driving a Case car, circled the track four times with his car in flames during the sweepstakes race. The fire was only extinguished when he brought up at the pits and a chemical extinguisher was applied. The summary:

Friday, July 4th.

Six miles, for a purse of $50—Won by Chandler (Mason Special); second, Wetmore (Chalmers); third, Endicott (Case); fourth, Ulbrecht (Pirate). Time, 5:27.

Ten miles, for a purse of $100—Won by Disbrow (Case); second, Nikrent (Case); third, Ulbrecht (Pirate); fourth, Wetmore (Chalmers). Time, 8:40.

Sixteen miles, for a purse of $200—Won by Mason (Mason Special); second, Nikrent (Case); third, Disbrow (Case). Time, 13:39⅕.

Twenty miles, for a purse of $100—Won by Snyder (Mason Special); second, Wetmore (Chalmers); third, Newhouse (Case). Time, 18:08.

Eight miles, novelty race for a purse of $50—Won by Nikrent (Case); second, Mason (Mason Special). Time, 7:19.

Forty miles, free for all, for purse of $250—Won by Mason (Mason Special); second, Newhouse (Case); third, Disbrow (Simplex); fourth, Wetmore (Chalmers). Time, 32:36.

Saturday, July 5th.

Six miles, for a purse of $75—Won by Chandler (Mason Special); second, Endicott (Case); third, Wetmore (Chalmers). Time, 5:17⅘.

Ten miles, for a purse of $100—Won by Mason (Mason Special); second, Nikrent (Case); third, Endicott (Case); fourth, Disbrow (Case). Time, 8:34⅕.

Eight miles, for a purse of $100—Won by Snyder (Mason Special); second, Newhouse (Case); third, Wetmore (Chalmers). Time, 7:19⅖.

Twelve miles, for a purse of $150—Won by Mason (Mason Special); second, Endicott (Case); third, Disbrow (Case); fourth, Nikrent (Case). Time, 9:58⅕.

Twelve miles, handicap—Won by Disbrow (Simplex); second, Endicott (Case). Time, 10:21⅕.

Forty-eight miles, sweepstakes, for a purse of $250—Won by Disbrow (Simplex); second, Mason (Mason Special); third, Endicott (Case); fourth, Nikrent (Case). Time, 42:35.

Only One Man Survived the Century.

Out of a field of seven starters only one man finished the 100-mile race promoted by the Automobile Club of Columbia, S. C., on the Fair Grounds mile track on July 4th; H. B. Moss, driving a Chalmers car, won in 1:59:10. Four other events that were scheduled were called off because in the estimation of the A. A. A. representative the track was insufficiently guarded, a decision that was reached after Willie Wilds in a Buick struck a spectator on the backstretch in the 90th mile and crashed through the fence; the spectator, whose leg was broken, attempted to cross the track from the infield. Wilds was awarded second prize, though he did not finish, and third was given to Kyle Benet, who drove a Chalmers. The only other event to be run was a one-mile exhibition drive by M. Rawles at the wheel of a Mercedes; his time was 1:02.

New Australian Record for Ford.

Some idea of the difficulties to be encountered in touring Australia may be gathered from the fact that in a trip of 335 miles, the driver of a Ford car, S. A. Cheney by name, passed through no less than 98 toll gates, 88 of which he had to open himself. Despite this fact, he established a new record for the trip between Adelaide and Broken Hill, covering the distance in 13 hours 55 minutes.

ENLARGED HEAD THAT FOLLOWS PROMOTION

The Sales Manager Tells Reilly About the Man Who Forgot to Be Considerate After He Rose Above the Ranks—Egotism and Haughty Attitude That Are But Stone in Path of Progress.

It had been ham and eggs for breakfast, and while the Sales Manager was content to lie under the shade trees on the lakeside farmhouse lawn and smoke, Reilly was loath to let such a fine morning go to waste so that gave him a prior right to the grounds, and when several salesgirls from a department store appeared on the scene they respected this prior right and waited to see the outcome. Reilly urged and

"I made several runs—over in the garden after my ball. There ain't no score!" replied Reilly.

"Thought you could play? You said you could."

"SYDNEY SEEMED TO TAKE DELIGHT IN SEEING HOW OVERBEARING HE COULD BE," SAID THE SALES MANAGER

and he begged and pleaded with the Sales Manager to shake himself a bit and play croquet. Croquet is generally associated with men of less mature years, but Reilly, the Sales Manager and their families were "vacationing" in the country at a farmhouse on the shore of a little lake and if a grown-up man wanted to acquire the croquet fever who was to prevent him?

When the Sales Manager worked he worked and when he loafed he loafed, and to get him to do the one when he was doing the other or the other when he was doing the one was an impossibility; and to see him hammering a wooden ball all over the lawn with a wooden mallet when he could just as well be lying in the shade savored too strongly of work.

But Reilly was persistent. He had a mallet in his hand and was suggesting a game, urged; he threatened to hit the Sales Manager with the mallet; but it did not do a bit of good.

"I'll play you, Mr. Reilly," volunteered a Titianesque blonde who was a couple of notches higher in the store than the other girls and who deported herself accordingly.

Reilly consented, and amid the laughter of the audience was still struggling at the middle wicket on the return trip when his sunny-topped rival tapped the stake; it was plain he would be welcome elsewhere, for the other girls wished the grounds, so he left the blonde to domineer the game and the other girls—who were just plain saleswomen while she was "head of stock"—and Reilly joined the Sales Manager beneath the tree.

"What's the score?" chided the salesman.

"Can't come back, I guess," said Reilly. And then, after several moments, during which they listened to the high-pitched voice of the blonde running the whole show, he added: "Isn't she one little snip?"

"Who? The Blonde?"

"Yes; look how she bosses those girls around. I suppose she thinks she's made of something different just because her mess of hair got her a job."

"You're not sore, are you, Reilly?" chided the salesman.

Reilly assumed an imitation grouch and made answer: "I guess you'd be sore if she walloped you the way she did me—and all the rest of that crowd looking on. And just listen to her," and he mimicked in a subdued falsetto, "No, Annie; the rules say you can't do that; you dont' get another shot; your foot slipped."

Digitized by Google

"Once upon a time," began the Sales Manager, "there was a man——"

"Yes?"

"There was a man——"

"What's the rest of the story? What was his name? What's the story?" asked Reilly, wondering if the Sales Manager was trying to "kid" him with a childhood yarn.

"The rest of it is that his name was Henry McK. Sidney and he was a twin brother to your blonde friend."

"Then you knew her before we came here?"

Panning With Good Intent.

"No; but having known Henry I feel quite well acquainted with her type; he wasn't exactly a blood brother, but a sort of member of the brotherhood of snips."

"Oh!" said Reilly, enlightened.

"One of these get-a-boost-and-it-goes-to-your-head guys; you know, don't you?"

"Rather!" was the dealer's comment.

"Henry," continued the Sales Manager, again taking up his once-upon-a-time story, "used to be a salesman—just a common, ordinary salesman, and when I first knew him he was drawing $30 a week and considered that the top notch of affluence. He was a salesman along with a lot more of us, and we pulled around together quite a bit; we came in contact with each other more or less, and quite a feeling of fraternalism sprang up.

"I remember well those old days," reminisced the Sales Manager, with a far-away gaze across the lake to the wooded hills beyond; "we all had ideals then and used to discuss our trade and trade conditions, and I daresay we had a remedy for every known ill or unsatisfactory condition, and there wasn't a man of any prominence to whom we couldn't have given cards and spades in his business and then beat him by several points. Gee! But how we used to pan some of the men we had to meet at the different factories and offices. Some of them were regular hardshell crabs and maybe we didn't hate them! One in particular—old Baldy Baldwin, we used to call him. He was the rottenest man to go up against!

Raise That Went to the Head.

"Baldy would say the meanest things to a salesman and would act in the snippiest manner—that is, when he would see you at all—and if we had had our way we would have soaked him in the eye every time we got into his office. But, of course, while the house we worked for was willing to stand for a lot of things, we rather felt it would object to our going around poking customers in the eyes. Then there was——"

"What's all this got to do with Mr. McK. Sydney?" interrupted Reilly, who commenced to evidence signs of a grouch.

"Oh, yes! Sydney—I forgot about him, or, rather, I was a little slow in getting around to him. Well, as I said, we used to pan everyone, and Baldy Baldwin in particular, and when a couple of us would meet in the same hotel and have an evening to kill, Sydney was the ablest panner, and the things he used to say about old Baldwin would have made his hair bristle, if he had had any.

"But to get to the real story: After a while Sydney got pretty good on the road and when there was a vacancy in one of the manufacturing plants with which we used to do business they asked Sydney if he wouldn't like the job, and he took it. He became a combination of a purchasing agent and several other things; he had some kind of title, although I can't remember just what it was. When Sydney landed that job all congratulated him and ourselves because we thought there was going to be one bright spot in our trips. We thought that calling at that office was going to get us a glad hand, even if we never landed an order."

Royal and Exalted Snippiest Snip.

"But he joined the Brotherhood of Snips," suggested Reilly.

"You're right; not only joined, but got himself elected to a high office. He was Most Royal and Exalted Snippiest Snip, or something of that type, and he proceeded to hold down his job in top-notch fashion. Of course, he didn't join the order and advance to that high office immediately, for his progression was gradual, even if it was rapid. When we first called on him he was half decent, but it wore off quickly and it wasn't long before he had old Baldy Baldwin beaten to a standstill.

"We all had said in the former days that if any of us ever landed a job of that kind we would remember our experiences of our outside travels and be considerate of the feelings of the people who had to do business with us; but Sydney seemed to take delight in seeing how overbearing he could be and if one of us would have gotten down and groveled in the dust on the floor I guess it would have tickled him half to death. He had forgotten all about the times when he used to cuss Baldy Baldwin and he took advantage of every possible occasion to try to impress upon us his greatness since he had been made a something-or-other in the factory."

"Why didn't you tell him what you thought of him?" asked Reilly.

"I was getting to that," continued the Sales Manager. "One of the boys did that very thing. He got tired of Sydney's overbearing tactics and one day when he was in Sydney's office Sydney did something particularly nasty and this salesman told Sydney he didn't like the way he was acting since he got promoted. This salesman was quite well acquainted with the 'old man' in this factory and had more license to take a fall out of Sydney than any of the rest of us did.

Haughtiness Gets Its Just Deserts.

"'Oh! you don't like it, eh? Well get to h—— out of here and don't you ever come back!' said Sydney.

"'I'll get out of your office, all right,' said the salesman.

"He took his troubles to the 'old man' and the 'old man' went in to Sydney and said, 'Tut, tut, my boy, don't get too high up, for the higher we go the harder the fall. Remember that you were a salesman once and don't be too hard on these boys. Shake a hand with 'em; remember how you liked to be treated when you were drumming around.'"

Sydney resign from the Order of Snips?"

"No; he couldn't; it wasn't in him; he high-horsed around until the 'old man' himself got sick of him and let him down the slide."

"He opened the back door and pushed himself out into the back yard," said Reilly.

"That's it, exactly," smiled the Sales Manager. "There's one thing I try to do, and that is to be decent to people who have to come in contact with me. It doesn't do any good to be haughty and overbearing; the only one it can benefit is yourself, and the only benefit you can get out of it is a little self-gratification, which in the end will always turn up to hit you in the face.

"I never will forget the disagreeable people I have been obliged to put up with and I never want to have people say about me the things such as we used to say about Baldy Baldwin. The only excuse I ever could see for such conduct was a mean disposition, and when a man gets so he can't control his own disposition he needs an operation.

Reilly's Disposition Disclosed.

"Now, your disposition——" and the Sales Manager slapped Reilly on the top of the head.

"Ouch!" shouted the slapped one. "What in h——'s the matter with you? Don't you know any better than that."

"Well, you old sore-pate, the next time you go rowing in the hot sun don't let your hat blow away." And the Sales Manager, entirely unsolicited, threw away his snipe, picked up a mallet and issued a challenge to the whole world.

"Yes," he added, "and I'll spot anybody three wickets."

GENERALSHIP THAT PULLED SALE FROM THE FIRE

Scientific Treatment of a Problem Which Effected a Sale That Would Have Been Passed Up by Many as an Impossiblility—Sales General and Able Salesman and How They Cooperated in Their Work.

Salesmanship is one thing; sales generalship is another thing; a sales general and a salesman are an almost invincible combination—provided they live up to their titles and are worthy of them.

There are among the readers of Motor World two men who may be said to afford excellent types of these two classes of men; one can sell cars, and lots of them; the other may not be so good a salesman, but he is an efficient director of sales work. The two together have pulled from the fire sales that neither alone probably could have saved. They are real men, not characters of fiction, but for the purposes of this story their names may be Cass and Gray. Cass is the sales general, Gray the salesman.

The two stood in the salesroom one day as a Z—— car stood at the curb in front of the salesroom of the dealer next door; as they watched, a man emerged from the Y—— salesroom, next door and went to crank the Z—— car.

Opening Fire on Dr. Brown.

"That's Dr. Brown. He was in here the other day, but I guess he has decided not to buy our car. Go out and speak to him," said Cass, the sales general.

Gray couldn't see what good it could do, but he did as directed.

"I see you've got your old Z—— car yet, doctor," he remarked.

"Yes," replied the physician.

Other conversation followed, and it led up to this statement by the doctor: "I don't like Cass. I won't have anything to do with him. He offered me only $600 for this car in trade."

"I'll tell you what I'll do, doctor," quickly replied Gray when this admission was made. "I'll get Mr. Cass's permission to handle all your business hereafter."

Gray did so, and Cass told him he should tell the physician that inasmuch as the $600 offer was made three weeks ago, the offer now was $550, because of succeeding depreciation in value. To Gray this seemed almost foolish, inasmuch as the doctor had said he was practically decided upon a Y—— car, but he respected his chief's judgment and returned to talk to the doctor. Finally the physician point blank asked how much he would be allowed on his car.

"Five fifty, doctor," genially replied Gray. "You see, it isn't worth as much now as it was three weeks ago, and the chances are that next week it will be worth still less."

The physician's answer was to throw in the clutch and drive away.

Two Weeks' Depreciation.

The foregoing conversation occurred on a Friday; on the following Friday afternoon Cass said to Gray, "It's a week now since you saw Dr. Brown. Better go up and see him to-night. Offer him $500."

Gray did as directed, and it must be said that much of Gray's efficiency lies in his ability to follow instructions to the letter. He called on the doctor, and pleasantly and as a salesman should, engaged him in conversation and led up to the car question. The doctor mentioned the fact that all that lay in the way was the amount he wanted in trade, and he was much nettled when Gray offered him $500 "because the car had depreciated that much in its last week of use."

The physician expostulated. Gray explained that a car in such a condition would depreciate rapidly until it got down to about $200, and would be worth about that much until it went to the junk pile, but that it certainly could not be worth any more than was being offered for it. The physician refused emphatically to have anything to do with the proposition and Gray departed.

Pressing Invitation to Depart.

The following Friday Cass said to Gray, "Better see Dr. Brown again. Offer him four fifty."

"He'll throw me out, Mr. Cass. You know just as well as I do that he won't listen to such an offer."

"Well," slowly replied Cass, "you'll get your salary just the same, won't you? I'm the man who will lose if I'm on the wrong tack."

"Quite right!" agreed Gray, and he called on Dr. Brown again.

This time they weren't long in getting to the question, and when Gray announced that the car was now worth but $450 the physician arose, opened the door and said, "I wish you wouldn't come up here wasting my time and yours. I refuse to listen to you. Good evening." And he motioned for Gray to leave the office.

Gray couldn't see just where these tactics were to avail anything, but he was perfectly willing to carry out instructions to the best of his ability, and when, a week later, Cass told him it was about time to call on Dr. Brown again Gray smiled, a trifle sceptically, perhaps, but went. His scepticism was not apparent as he again approached Dr. Brown, and he acted for all the world as if he was making the physician a good proposition when he offered him $400 for his old car.

Again the doctor in no uncertain language invited Gray to remove himself from the office and not come around again with such nonsensical stuff as he had to offer. This made twice, eight days apart, that Gray had virtually been thrown out of the physician's office, and this would have been the signal for many salesmen to give up the task. But Gray went back and reported to Cass, who only smiled.

Demonstrating Under Difficulties.

Saturday of the following week Cass said to Gray: "Now, Sunday ought to be a fine day, and I think you ought to give Dr. Brown a demonstration. Take a car and a chauffeur and give him a ride; take him anywhere he wants to go, buy him a lunch out in the country or wherever you think best."

Gray didn't slip any armor plate under his vest for fear of buckshot, although he was somewhat doubtful as to the results of his errand. But he did as directed and drove up to the doctor's residence and office, walked into the waiting room and told the doctor it was such a fine day he had come to take him for a ride. The doctor didn't seem anxious, but inasmuch as he had a call to make, Gray offered to take him to the patient's residence. The doctor consented, and as the physician left the car Gray said he would wait for him, as he wished to give him a little run, the morning was so fine.

Dr. Brown rather grouchily told Gray he needn't wait, that he would go back on a trolley car. But when the physician emerged Gray and the car were still waiting and Gray directed the chauffeur to

Digitized by Google

take a drive over a certain road. Gray talked car hardly at all. When the car hit an unusually rough spot and the passage was made in comfort, Gray would say, "You'd hardly notice that rough spot, would you, doctor?" and then Gray would immediately switch to a foreign topic.

The party sped on to a cozy little eating place Gray had in mind, and over the lunch cars were pretty much a foreign topic. They talked of everything else; Gray, instead of putting the physician on the defensive by hammering him on the car proposition, was permitting the doctor to become the aggressor in the sales work. After lunch Gray directed the chauffeur to take them to the doctor's residence, and when they reached the house Gray, without a mention of the car, was bidding the physician farewell when the doctor asked him if he wouldn't come into the office.

In the office the physician said he really liked the car and wanted one, but couldn't see his way clear to accept the offers which had been made to him. In the course of the conversation he asked about the trade-in deal and what he would be allowed.

"Three fifty, doctor," replied Gray. "Your car certainly isn't worth as much now as it was a week ago."

"See here, Gray," exclaimed the doctor, wheeling in his chair, "this is a damned outrage! Here you keep coming up here, wasting my time and your time, with the most foolish offers I ever heard. Three fifty! It's ridiculous! I won't take it!"

"It's all your car's really worth as it stands to-day."

"I'll tell you what I'll do, though," he replied. "That six hundred offer that Cass made me is low enough, but I'll take that."

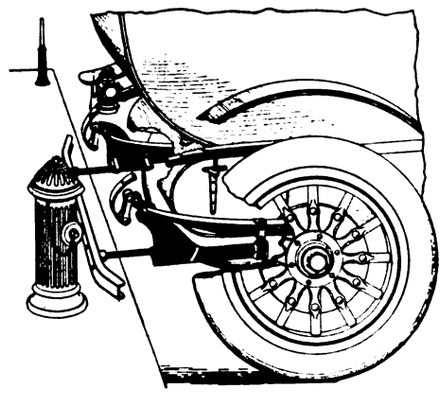
"I can't do it, doctor," replied Gray with a convincing manner. "Your car was worth six hundred then, but it isn't now."

The physician—he had disclosed the fact that he wanted the car and wanted it badly—was at the wavering point, the sale stood a good chance of being made or lost right there, and it was up to Gray to do whatever was to be done.

"I'll tell you what I'll do, Dr. Brown," he said. "I've made you an offer of three hundred and fifty dollars for your car, but I'll remake the offer I made last week of four hundred. I really haven't authority to do it, but I'm sure Mr. Cass is not an unreasonable man and I'm sure he will sacrifice the small matter of fifty dollars rather than have it stand in the way. I'll allow four hundred on your old car. Sign right here."

Gray laid a contract blank on the desk in front of the doctor and the latter pulled out his fountain pen and began to sign, but all the time murmuring "damned outrage," "highway robbery" and such things. When he had signed the contract Gray said, "I'll need a five-hundred-dollar deposit, doctor."

"Five hundred dollars deposit!" exclaimed the physician. "There's my old car—that four hundred."



"I can't take the old car!"

"Five hundred dollars deposit! Damned outrage! Highway robbery! Colossal gall!" muttered the physician, but all the time he was attaching his signature to a check.

When Gray got the check and contract he bade the physician a very pleasant good day and walked out to his car. No general rules had governed this sale; it, like many others that were made by Gray and Cass, was an entirely separate and distinct scientific problem. In another case the tactics might have failed, but they won because Cass studied the man and the case and made the sale a campaign by itself.

Bumper Designed for Rear Protection.

The evil results that are likely to follow the head-on impact of an automobile against another of its own kind or any other object are easily imagined, and there is nothing to wonder at in the popularity of front-end bumpers. But while the effects of rear-end collisions are not so often considered, they are by no means to be ignored, as many dented rear tanks, marred bodies, buckled springs and other mute evidences of rough treatment bear witness. The protection of the rear end of the car has been made the special province of the M. J. L. rear adjustable bumper, manufactured by M. J. Leclerc, of 108 West 52nd street, New York, which is clearly shown in the accompanying illustration.

LECLERC'S REAR BUMPER

The bumper is so designed that it can be attached to all forms of spring suspension without the necessity for drilling holes in the frame, without removing the spring shackle bolts and without interfering in any way with the construction of the car; the shape and method of attachment of the brackets are plain from the picture. Coil springs are provided to take the shock in case the car is backed into anything, or if another vehicle runs into the car from the rear. A wide range of adjustment is provided, so that the bumper can be adapted to any car with very little trouble. Polished brass, nickel and black finishes are provided.

Misusing Storage Battery Terminals.

It is said of a well-known storage battery maker that so anxious was he that his instructions regarding the care of a certain battery shipped by freight on a car to a distant point reach the purchaser of the car that he wired the tag on which the directions were printed to one of the battery terminals. Which was all right as far as it went; it was practical assurance that the tag would not be separated from the battery by accident. But during the shaking up that the car got in transit, the wire holding the tag shifted itself around and short-circuited the battery, and when the owner attempted to start his car he had no "juice," of course. The moral is plain: Never attach anything to a storage battery's terminals except the wires that are supposed to be attached to them. The terminals may look like a handy means of fastening the battery, but they were not put there for that purpose.

Emphasizing the Value of Lamp Covers.

With the increasing use of electric lighting, the cost of the lamps themselves, or rather the expense of replacements of front glasses and lenses, has increased slightly, which serves to lend additional emphasis to the desirability of strongly constructed lamp covers for use when the lamps are not lighted. Covers are not expensive, and they can be relied upon to protect glasses and lenses from stones thrown up by preceding cars. Incidentally, they keep dust and dirt out of and off the lamps, and this service is of no small consequence when it is considered that the more the lenses and glasses of lamps are cleaned the greater the danger of scratching their surfaces and reducing their efficiency; also, even a tiny scratch weakens the glass considerably and renders it much more easily broken.

"Gas Charge" in Storage Batteries.

A battery that is fully and freshly charged and has had no current drawn from it since charging will show an open-circuit voltage that is far above the usually figured two volts per cell. A 44-cell battery, for instance, may read as high as 114 volts. This high figure very quickly drops, however, after the battery has been put to work. This high water mark of the voltage, so to speak, is usually referred to as a "gas charge."

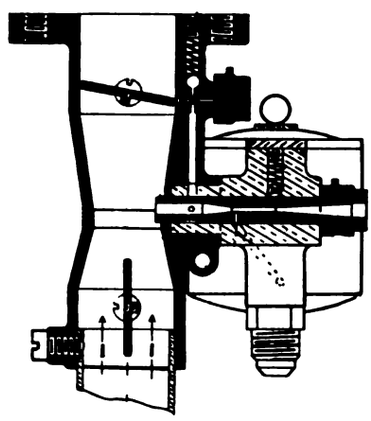
SIMPLICITY SIMPLIFIED IN ZEPHYR CONSTRUCTION

Some Common Components Conspicuously Absent—Spray Nozzle, Air Valve and Needle Valve Replaced by Simpler Devices.



In the endeavor to reduce the carburetter to its simplest terms, while retaining all the advantages of more complicated types, so many different combinations of parts have been devised that there is an excuse for wondering how anyone can think up a new arrangement. Nevertheless, new ideas are brought to light with surprising frequency, and hitherto untried methods of doing with few parts what has been done with many are constantly being brought into the light of day. One of the most recent of these "simplified carburetters," and one that stands out by reason of the maker's statement that it has no air valve, no spray nozzle and no needle-valve, is the Zephyr, made by Breeze & Chapman, of Detroit, and marketed by the Hibbard Engineering Co., Majestic Building, Chicago. The accompanying illustration shows the extremely simple arrangement of the parts of the instrument.

The large vertical air passage, with a tapered section, is joined, at its smallest diameter by a much smaller passage opening into it at right angles; the opposite end of this small passage, which also has a restricted middle part, is open to the atmosphere. At its smallest diameter it is joined, at right angles to its axis, with four small holes opening into the passage, the holes being of graduated sizes. The plug in which the horizontal passage is formed can be turned from the outside of the carburetter with the thumb and finger. A small passage communicating with the supply of gasolene in the float chamber is formed in such a position that it will register with each of the holes in the horizontal air duct as it is turned. Gasolene is drawn through whichever hole is in register with the gasolene passage, and obviously the larger the hole the faster the flow. This arrangement takes the place of the usual spray nozzle, and by changing from one hole to another the flow of fuel may be varied.

About half-way between the gasolene passage and the point where the small air passage joins the main air passage a groove is formed around the horizontal plug, and holes through the walls of the plug place the groove in communication with the interior. A passage, drilled vertically through the wall of the large air tube, joins a second horizontal plug, which is made on the same principle as the lower one but is much shorter; it also is adjustable from the outside and has four graduated holes, any one of which may be brought into register with the vertical passage.

There are two butterfly valves of the type commonly employed as throttles, one near the bottom of the main air passage and the other at the point where the upper rotatable plug opens into the main air passage; the lower one is the throttle and the upper a "starting shutter." The throttle is used in the customary way, while the starting shutter is used only for starting the motor. The float chamber and its level-regulating devices are built on the usual principle, generally speaking.

The operation of the carburetter is easily followed with the aid of the illustration. Assuming the throttle and the starting shutter to be open, the air passes through the vertical passage and also through the horizontal passage, in the latter case taking up gasolene as it passes over the gasolene atomizing hole. The excessively rich mixture of much gasolene and little air enters the main passage and is mixed with the main air supply, so that there is a sort of double mixing effect which results in excellent vaporization. The dimensions and the shapes of the passages are such that there is automatic compensation for changes in speed.

ZEPHYR CARBURETTER

For starting or low-speed running the second or higher of the small air passages is brought into play by closing the starting shutter, which gives direct communication with the gasolene supply and shuts off most of the air, the result being a rich mixture. The more the shutter is closed, the richer the mixture; the adjustment is made from the dashboard. The effect of the starting shutter is practically that of priming the engine with atomized fuel, which has obvious advantages over priming with raw gasolene in the usual way.

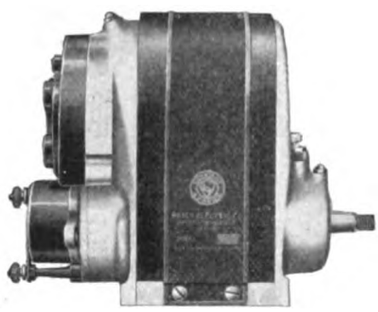
One of the cardinal points of the Zephyr carburetter is its extreme accessibility. The atomizers can be withdrawn without the use of tools, examined, blown through and cleaned, if necessary, with the greatest ease; further, they can be removed to lock the motor. The cover of the float chamber can be swung open and the float removed from the valve and the valve itself taken out and examined. The level of the float may be changed without even stopping the motor. If desired, the main air passage can be swung around so as to be horizontal, if such a position is more convenient, or can be clamped at any angle by means of a pinching screw and split clamp arrangement.

To Prevent Rust on Wire Wheels.

That old saw anent the virtues of an ounce of prevention well may be applied by users of wire wheels to obviate the rusting which is likely to take place where the spokes cross one another. Regardless of the quality of the enamel that is used, constant vibration is likely to cause it to chip, and where it chips the spokes will rust and in time they will break if the rust is permitted to eat its way into the metal. The ounce of prevention consists of the application of successive coats of thin, hard enamel, say once or twice a season, or as often as the existing enamel shows signs of chipping or wearing off. Almost any good enamel produced for use on metallic surfaces will serve the purpose, and it should not be put on too thickly or it will show a tendency to chip easily. The better way is to apply several coats of very thin enamel, allowing each to dry thoroughly before the next is put on.

The drying process is an important part of the work and should be given ample time.

Fallacy of Camphor as Fuel "Dope."



If it will console any of those who may have been tempted to adulterate their gasolene with gum camphor to know it, tests that just have been completed in England demonstrated beyond the shadow of a doubt that the addition of this pungent substance to the fuel makes absolutely no difference in either fuel consumption or speed; neither does it make an engine start any more easily than it ordinarily would start on simon-pure gasolene. The tests were conducted on the road under service conditions by a private owner and two cars, one rated at 10 horsepower (according to the British idea) and the other at 25 horsepower, were used. The camphor used was the Japanese article of commerce and the quantity added to the fuel was ½ ounce to the gallon in some of the tests and ¼ ounce to the gallon in others. No difference in the operation of the car could be distinguished after the addition of the camphor.

REMY PEOPLE CONTENT TO MAKE GOOD MAGNETO BETTER

Detail Improvements Only Changes in Latest High-Tension Models —Cloth Gears and Timing Device Features.

Magnetos of the better sort, like the automobiles of which they are such important components, have been brought to a state of development where radical changes are not required, and such improvements as are found desirable are in those details which, though often referred to as "minor," are of vital importance. The latest model of the Remy high-tension magneto, manufactured by the Remy Electric Co., of Anderson, Ind., and which now is being presented to the trade, is a good example of a well-developed high-voltage generator in which established practice is adhered to and only

REMY MODEL P MAGNETO

slight changes have been found necessary.

The model P, as the new magneto is styled, is said to be absolutely water- and dust-proof. The end plates carrying the special magneto type ball bearings are accurately machined to fit the magneto and the distributer is fitted in the same way to the gear case, while the joints are provided with packing that forms an effective seal. Even the high-tension terminals are thoroughly water-proof. The circuit-breaker is protected by a cover of Bakelite and, incidentally, the same insulating material is freely used throughout the machine, the Remy company having installed the necessary plant for making and applying this substance, which is said to be superior to the best hard rubber in strength, resistance to heat and other qualities that are essential in a material of this class.

Rugged construction of the armature is provided by casting the hard bronze armature heads on the steel shaft, so that, though of different materials, they are practically of one piece. The cotton covering of the armature winding is impregnated with Bakelite. Slight improvements have resulted in increasing the speed of action of the circuit breaker, which may be removed for inspection without the use of tools. That vital little part, the circuit breaker cam, is of the finest chrome nickel steel, hardened and ground and tested for extreme accuracy. The breaker and its housing are reversible, so that the timing connection can be made on either side. The timing range is 35 degrees, and it is claimed that there is practically the same spark intensity at extreme retard as at extreme advance.

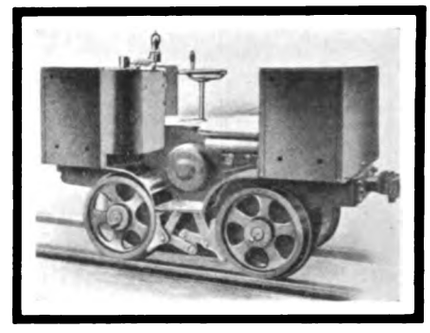
To the distributer is fitted a timing button, which brings the circuit breaker into proper position and locates the terminals for the purpose of making connections. This is a device that saves considerable trouble in timing the magneto.

The latest Remy dash coil is mounted with the switch, the coil lying behind the dash with its axis crosswise of the car; only the face of the switch, with its operating handle, appears on the driver's side; it has the usual magneto, battery and off positions and is fitted with a lock.

Particular attention has been given to the distributer gears, which of necessity are accurate in cutting and in the meshing of the teeth. The gear is of bronze and the pinion is of compressed cloth with steel plates, the combination forming a silent, smooth drive. Bakelite is found again in the distributer brush holder, which is rigidly mounted on the bronze distributer gear. The condenser and its casing form a tight cover over the armature; the active elements of the condenser are embeddel in a compound that is solidified by heat, while the outer covering is of Bakelite. The same care that is used in protecting the condenser from moisture is employed in the construction of the coil, which is so impregnated and enclosed that it is proof against the attacks of that great enemy of high-tension currents—moisture.

Proper Method of Testing Electrolyte.

In testing the gravity of the electrolyte in a storage battery a little of the liquid is drawn off with a syringe, put into a test glass and afterwards returned to the cell from which it was taken. It is important that all of the stuff should be returned, as the electrolyte from one cell, if mixed with that from another, may cause inaccurate and misleading hydrometer readings.



Simple Remedy for Vibrating Lamps.

Very often side lamps that are attached to the dash by means of projecting brackets will vibrate excessively at critical car speeds. Sometimes the fault can be remedied by altering slightly their position on the bracket—slipping them up or down a fraction of an inch—the theory being that their period of oscillation then is altered.

DIMINUTIVE RAIL TRACTOR THAT HAULS HEAVY LOADS

Little "Electric Engine" that Handles Fifteen Tons on Trailers—Four-Wheel Drive, no Steering, and Railroad Brakes.

The narrow-gauge shop railway originally intended chiefly to facilitate the moving parts too heavy for handling in other ways, has been developed and improved greatly since the time when its rolling stock consisted only of rough little cars moved by muscular power — human, usually, but equine when the loads were exceptionally heavy. The cars have been developed from heavy, hard-running conveyances to modern affairs, sometimes with roller bearings, and various types of "locomotives" have been built to haul the cars in trains, handling weights that otherwise would be im-

AUTOMATIC "LOCOMOTIVE"

practicable. While steam, gasolene, compressed air, trolley systems and cables alll have been employed, these systems have disadvantages for certain classes of work that are eliminated in the compact, powerful battery rail tractor, an excellent example of which is manufactured by the Automatic Transportation Co., of Buffalo, and is shown in the accompanying illustration.

A notable feature of the machine is its diminutive size. Measuring over the draw-heads, or couplings, it is an inch short of six feet long, has a wheelbase of 28 inches and a gauge of from 20 to 36 inches, according to requirements; yet it is capable of hauling from 12 to 15 tons on trailers, on level track, and does its work with celerity.

As there is, of course, no steering gear, it is a comparatively simple matter to gear the motor to drive all four wheels, so that there is the best traction possible. The wheels are 18 inches in diameter. The storage battery from which current is drawn by the motor is carried in a box at one end of the "industrial engine," as the manufacturers call it, and at the other end is the controller and the hand-wheel which controls the brakes.

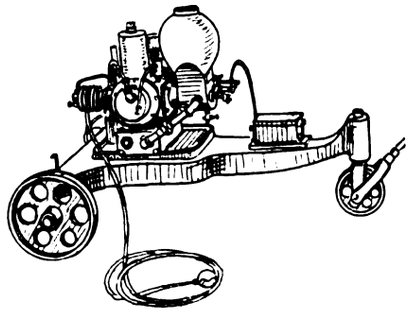
POWER PUMPS ON WHEELS AS BUSINESS BUILDERS

Advantages of Portable Garage Compressors and Their Appeal to the Private Owner—Some Simple Types Suitable for Average Use—Principles of Pneumatics Outlined—One- and Two-Stage Pumps Contrasted.



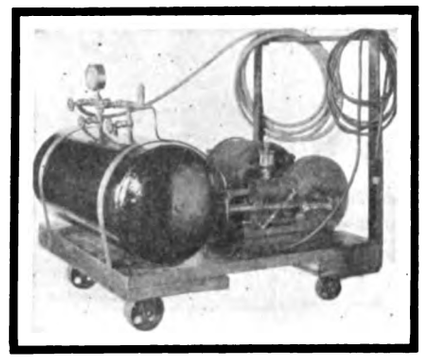
Air, according to the Standard dictionary, is "the mixture of gases that forms the blue envelope of the earth"—which is decidedly picturesque even if it is not very elucidating. To the motorist, air is all that the dictionary says it is and a whole lot more; it is his salvation; it has made possible the automobile. Without it between him and the roads over which he travels there would be no occasion to eulogize John Boyd Dunlop who, as every one knows, first put it into tires. And it has been leaking out of tires ever since.

Air is a very peculiar substance, and it has a lot of funny characteristics that seldom are brought to the attention of the average person not given to delving into the science of pneumatics. It is a perfectly elastic gas, for instance, which means that its volume decreases in proportion to the pressure under which it is placed, provided the temperature is maintained constant. But the higher the pressure becomes the greater increases the temperature. Which accounts for a measure for the heating of the barrel of a hand pump during the process of tire inflation. Part of the temperature rise is due to the friction of the plunger within the cylinder and part is due to the natural increase in temperature due to compression. It is because of this temperature rise under pressure that the Diesel engine is possible. In it the air is compressed until it becomes hot enough to ignite the fuel which is injected into the cylinder. Hence, for continuously operating air compressors some means must be provided to dissipate this heat and for this purpose both air cooling by means of flanges on the cylinders and water cooling with water jackets is used.

FOUR SIMPLE TYPES OF ELECTRICALLY-DRIVEN PORTABLE GARAGE AIR COMPRESSORS

But to get back to air itself—it has another disconcerting peculiarity that even Dunlop discovered when he built his first

UNIVERSAL "GAS" PUMP



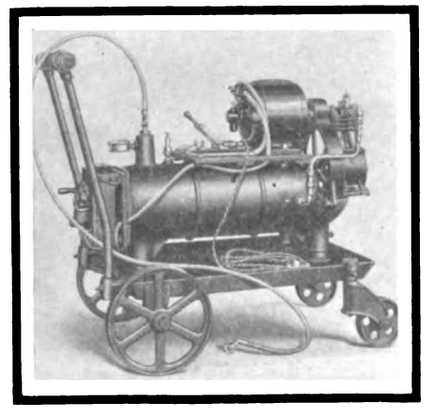
tire some 26 years ago. It leaks through the rubber of which tires are made, and the reason it leaks through is because it is not possible to eliminate porosity. The air may take months and months to leak out of a tube—some truly wonderful records have been made by tourists—but in the end it will leak out. The leak is no fault of the tires; it is a fault of the rubber, but it need cause no one any misgivings, for the leak in any case—unless the tubes are very bad—is tiny and practically is of no account. The fact remains, however, that the air actually does leak out through the pores of the rubber, so to speak, and this accounts for tires that seem flatter than usual after considerable use, even though their valves are O. K., and that have not been punctured. Incidentally, it has been demonstrated that carbonic acid gas, which is used to considerable extent for inflating tires, passes through the rubber quite a little bit more quickly than does air and consequently tires inflated with it require attention more frequently than do those that hold only pure air, as did the original Dunlop tires.

It is perfectly plain, of course, that every bit of air that leaks out of a tire must be replaced eventually, and the sooner it is replaced the better it will be for the tires, for, as has been pointed out so many times, there is nothing that destroys tires more quickly, or with more certainly, than does under-inflation. Billy Rea, whose story was told two weeks ago in Motor World, re-

Digitized by Google

alized that fact and he made capital out of it; he has never rued the bargain.

Just as surely as the air must be replaced in the tires, just so surely does the problem of its replacement face the owner of the car; either he must use his hand pump and plenty of "elbow grease," unless his car is equipped with a power pump, or he must make arrangements to keep his car in the garage of some up-to-date proprietor who is alive to the possibilities of his business and who has the business acumen to instal some sort of a compressing plant. It is doubtful if any one really enjoys pumping up a 36 x 4½-inch tire by hand; it is a long, tedious proceeding that is calculated to take the starch out of a person even in cool weather; in hot weather it is nothing short of exhausting. Ergo: it stands to reason that the garage proprietor who caters to the interests of his customers to the extent of providing a power garage pump for their use is bound to attract trade to his door.

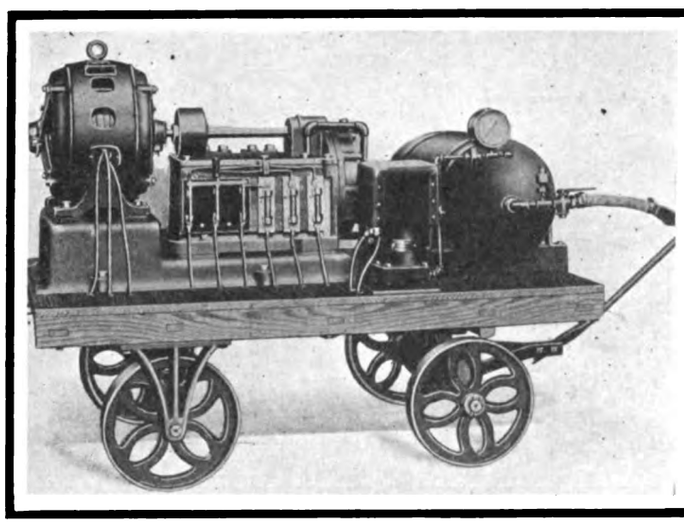


BASTIAN TWO-STAGE PUMP

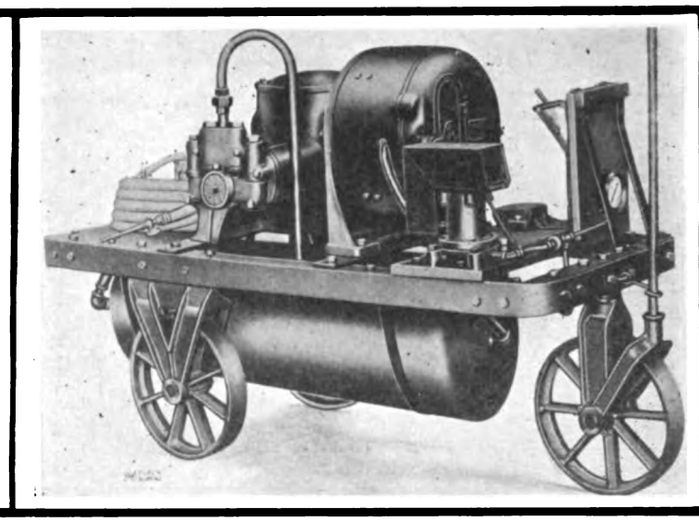
Where Electricity Steps in.

With a small compressor, like the one Billy Rea put in his garage, for instance, it is a comparatively simple matter to lead a pipe from the pump, or from the storage tank, if one is used, to a central place in the garage where it is accessible to all. This necessitates that in the case of tire replacements, the work be done in the garage, where valuable space may be occupied by the car under repair prior to the inflation of the new tire. To obviate this difficulty, and also to provide a convenience for touring transients, several garage owners have laid pipe lines to some point outside the building, either at the garage door or still further away at the curbing, the hose connection frequently being housed in a small box.

This method has the objection, however, that it is not always easy to keep a long pipe line tight; if the pipe line is rubber tubing, it will disintegrate in time and leak, and if it is metal it will be prone to collect accumulations of moisture at any low points. This moisture, of course, then will be blown into the tires, and no one need to be told that nothing but clean, dry air ever should be pumped into a tube. Nothing remains, therefore, but to adopt some sort of a portable compressor that can be moved about from place to place in the garage or taken out onto the street or roadway, if necessary, for temporar yservice.



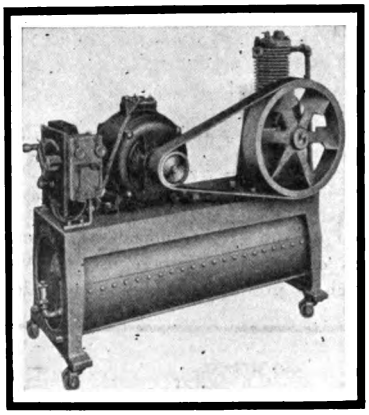
MIMIMAX PUMPING PLANT



Electricity, of course, suggests an immediate solution of the problem, and the variety that obtains in the construction of portable electric compressors is very nearly as great as the variety in small single and twin-cylinder pumps of the types illustrated and described in the last two issues of Motor World. Several types of compressors, suitable for the average garage, operating on gasolene, also are made, though the majority of manufacturers prefer to drive their pumps by electricity as suggesting at once the simplest kind of mechanism requiring the least of care.

Light and Compact Construction.

Of all the various portable air compressors designed for garage use, the Victor, which is produced by the Victor Electric Co., of Chicago, Ill., and which is illustratel herewith in the accompanying plate, probably is the simplest; certainly it is the lightest, and for this reason it is well adapted for use in the small private garage as well, for it takes up the very minimum amount of space. As may be seen by the picture, the pump itself is scarcely more than the usual hand-operated cylinder, though it is more ruggedly constructed, of course, and special attention has been paid to the valves with the view of making them as accessible as possible; both are of the ball type. The plunger is connected to the large wheel, which, in turn, is driven from a pulley on the motor shaft by means of a small, round belt. The second cylinder is nothing more than a small reservoir which collects moisture or oil and prevents it entering the tire; it is fitted with a drain cock. As the motor can be wound to operate on any kind of a lighting circuit—either alternating or direct current—and for any voltage, the pump is applicable anywhere current is available.



ALLIS-CHALMERS HEAVY DUTY OUTFIT

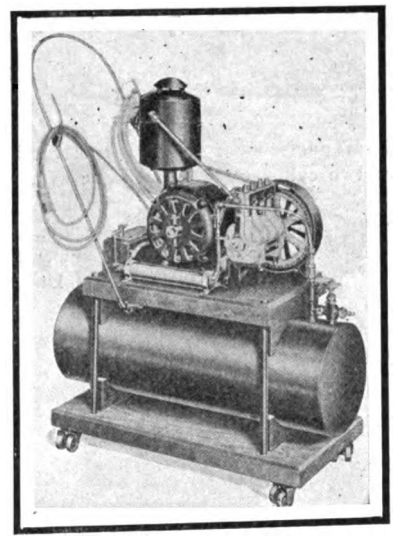
GENERAL ELECTRIC WITH UNDERHUNG TANK

Digitized by Google

The Ingersoll-Rand compressor, produced by the Ingersoll-Rand Co., of 11 Broadway, New York City, and illustrated on another page, scarcely is any more complicated than is the Victor, though the

CURTIS GARAGE APPARATUS

design is entirely different; the picture shows quite clearly its method of application and its size, as compared with the average touring car. It weighs only 75 pounds and measures just 23 inches in height. The small single-cylinder compressor (air-cooled) is direct connected to a one-half horsepower motor operating at 1,700 revolutions a minute, and as an indication of its capacity, it is pointed out that it will pump up a 35 x 4-inch tire from flat to 70 pounds pressure in three minutes. Obviously, its range of action is only limited by the length of the wires leading to the motor; the machine is supplied complete with hose and pressure gauge, switch and wiring and will operate on either direct or alternating current.



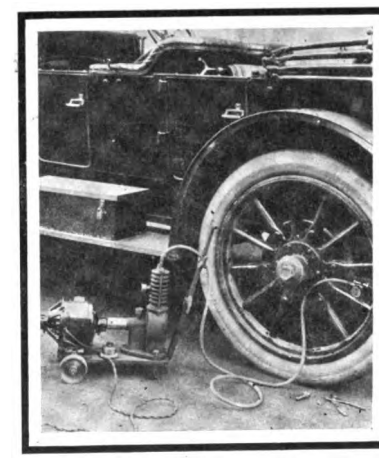
Tires Inflated in Three Minutes.

The Buckeye compressor, made by the Central Brass & Fixture Co., of Springfield, Ohio, is not unlike the Ingersoll-Rand in size and general appearance, though there is an important difference in the drive. The Ingersoll-Rand pump is direct connected, whereas the Buckeye is connected through the intermediary of gearing; the motor is rated at one-third horsepower and operates at 1,750 r.p.m., at which speed the compressor is calculated to inflate an ordinary tire in something under three minutes. The net weight of the whole apparatus is 60 pounds and, as is the case with all the electrically operated pumps illustrated, either alternating or direct current can be used with equal success.

The American electric pump, which is manufactured by the American Electric Air Pump Co., of Pittsburgh, Pa., is another that is remarkably small, considering the amount of work it does and saves. It differs from all of the others in that the pump portion is of the rotary type, as is made plain by the picture; it is direct connected to a one-half horsepower motor and will fully inflate a normal size tire in from one to three minutes. Owing to the fact that the pump is of the rotary type there are no valves and the operation of the apparatus is unusually quiet. Equipment includes 10 feet of extension cord to be attached to any convenient lamp socket, 10 feet of heavy air hose and an Acorn coupling.

Gasolene Motor Operates Pump.

Of course, where electricity is not available, though there are few garages where electric lights are not used, an electric compressor cannot be used, and to fill this discrepancy there has been developed the gasolene engine driven type of compressor



KELLOGG FOUR-CYLINDER PUMP

of which the O-B, produced by the Universal Mfg. Co., of Minneapolis, Minn., is a representative example. The plant, as illustrated, is complete within itself and gasolene engine direct connected to a sin- consists of 1½-horsepower water-cooled gle-cylinder air-cooled pump of the usual reciprocating variety. These two elements form a unit which is mounted on a substantial iron frame carried on three wheels; a wheel lock is provided to prevent the machine "working away" while in use. The engine cylinder is water-cooled by means of a large reservoir cast integral with the cylinder, circulation being carried on by thermo-siphonic action; the gasolene tank also is mounted on the engine and the ignition coil is located further aft on the supporting frame. In order to obviate intermittancy, the air from the pump cylinder is passed first into a pulsating chamber which also serves to collect moisture and to prevent it from being forced into the tire. Pressure up to 250 pounds to the square inch can be obtained, and the pump will inflate the ordinary tire in less than two minutes. The O-B outfit, of course, is portable in the fullest sense of the word, for it is not dependent upon electricity and can be operated anywhere gasolene can be obtained. The shipping weight of the whole outfit is 250 pounds, and is over-all dimensions are 36 x 28 x 27 inches.

All of the compressors described are of the type designed to be connected directly to the tire with the compressor operating, there being no provision made for storing air under pressure for use outside the radius of the electric wiring connecting the source of current and the motor; as such, they are all small and compact, of course, and require the minimum of space when stored. For temporary use at a distance from the source of current, as, for instance, across the street from a garage where a new tire has been put on a wheel, some provision for the storing of air is necessary, and this also is necessary where the air is used for brazing or for operating pneumatic tools, a secondary use for such apparatus that has been found profitable by a great many garage owners.

Motors Mounted on Tops of Tanks.

In devices of the kind provided with a reservoir, the motor and compressor almost invariably are mounted on top of the tank in order to save space. In the Curtis, which is made by the Curtis & Co. Mfg. Co., of St. Louis, Mo., for instance, the tank is contained in a substantial framework, atop of

INGERSOLL-RAND OUTFIT

which is mounted the electric motor and starting rheostat and the single-cylinder vertical compressor. The compressor is of the air-cooled type, there being fan blades in place of the usual flywheel spokes, and it is belted to the driving motor

Digitized by Google

through the intermediary of a wide, flat belt. The whole apparatus is mounted on universal castors and can be connected to any convenient lamp socket. In this respect it should be remembered that it is a great deal simpler to run wires to the curbing for the connection of a compressor motor than it is to run a pipe line from the compressor to the curb. The Curtis outfit, in common with most of the others, is fitted with an automatic unloading device which obviates the possibility of the tank being filled to the danger point.

Operative Cost Few Cents a Day.

In the Minimax compressor produced by Herz & Co., of New York City, the electric motor only is mounted on top of the tank, the compressor being located at the end of the tank on a special bracket made for its reception. The motor is rated at one-quarter horsepower and is connected to the compressor, which is of the two-cylinder air-cooled type, through the intermediary of gearing which permits the motor to operate at its most efficient speed; the starting switch, as may be seen in the picture, is mounted on top of the tank and the rheostat is mounted at the end. The upper portion of the truck is formed like a tray to receive the wiring and the hose and to serve as a handy receptacle for small tools, etc., used in replacing tires. Owing to the small size of the motor, the cost of operating the pump, it is pointed out by the manufacturers, is not more than a few cents a day. The weight of the outfit is 260 pounds and the overall dimensions are 32 x 35 x 20 inches.

Two-Stage Compressors Defined.

Both the Allis-Chalmers and the General Electric pumps illustrated herewith are for rather heavier duty than are any of the others, which fact is made plain by the pictures which show rugged construction and large capacity. The former is made by the Allis-Chalmers Co., of Milwaukee, Wis., and the latter is produced by the General Electric Co., of Schenectady, N. Y. Both employ twin-cylinder completely enclosed compressors and in both the drive is transmitted through gearing. The Allis-Chalmers outfit is mounted on a wooden frame carried on four wheels, the storage tank being above the frame, whereas in the General Electric outfit the framework is of steel and the tank is slung beneath it where it is out of the way and occupies space that otherwise would be wasted. The former is equipped with an automatic unloading device which cuts out the compressor immediately the pressure reaches a predetermined figure and the latter has an automatic switch which operates in much the same manner.

Air compressors of the type described, and for use where high pressures are not required, generally are of the single stage type. Which is to say, either a single cylinder is employed and it pumps the air direct into the tire or the container, or where two or more cylinders are used each pumps directly. Where higher pressures are required or it is desired to reduce the power needed to operate the pump, the two stage principle is employed, though it is by no means general for small outfits. The two stage pump differs from the single stage pump in that the former must have at least two cylinders, one of which exhausts into the other. The air that is compressed in the first cylinder therefore is transferred to the second cylinder, where its pressure is raised still higher and finally reaches the tank or the tire, as the case may be.

High and Low Pressure Cylinders.

In the Bastian garage outfit illustrated herewith—it is made by the General Utility Co., of Philadelphia, Pa.—this two stage principle has been adopted, and the resultant pump is of unusual construction. The two cylinders are placed one over the other, the low pressure cylinder being at the top, and the two pistons are interconnected and so arranged that the upper one is discharging while the lower is taking its charge. On the ensuing stroke, the air under pressure in the smaller cylinder is transferred to the storage tank. The electric motor is geared to the compressor, which, with the storage tank, is mounted on a substantial wooden platform which, in turn, is mounted on wheels. Two hundred pounds pressure is obtained quite easily, though obviously not more than 100 ever is needed for inflating tires. Equipment includes a safety valve, a gauge, 20 feet of air hose and 20 feet of electric cable.

Automatic Air Release Protects Motor.

The Kellogg outfit, which is manufactured by the Kellogg Mfg. Co., of Rochester, N. Y., bears the distinction of being the only four-cylinder pump of its kind on the market. The pump itself is unusually small and compact and except that its cylinders are water-cooled to permit of heavy duty, it is the Standard Kellogg pump that has become so familiar because of its widespread adoption for automobile use. Only the heads of the pump cylinders are water-jacketed, the water circulating from the tank around the cylinder and back to the tank on the thermo-siphon principle. The capacity of the pump is 200 pounds pressure to the square inch, and a simple automatic air release switch, to permit the motor to attain full speed before the load is placed upon it, is fitted as a precaution against the blowing out of line fuses. The particular advantage of any system of the kind in which a storage tank is used is that the tank can be filled by connecting the motor to any convenient lamp socket after which the whole outfit can be moved close to a car, thus obviating the necessity for moving the car on a flat tire and damaging it. Where the storage tank is not needed, the Kellogg outfit is supplied without it.

Care Needed in Selecting Pumps.

In purchasing garage air compressors operated by electricity, great care must be taken to determine accurately the kind of current used for the lighting circuit—whether alternating and the number of cycles or direct—and the voltage, for an alternating current motor will not operate on direct current or vice versa. Similarly, care must be taken to ascertain the exact voltage. A 110-volt motor, for instance, will heat badly on 90 volts and will burn itself up on 220 volts. As a general rule the company that supplies the electricity for lighting will be glad to give any one the necessary data, and this should be obtained.

Marvels of Modern High-Speed Steel.

To one who has used lathe tools of ordinary tool steel the working of modern high-speed steel is nothing short of marvellous. The lathe working with high-speed tools is speeded up and the tool forced to its work until it actually attains a dull red heat, sometimes, and yet it does not lose its hardness or its cutting edge. The chips and shavings come off the work blue from the intense heat. While the scientific reason for the indifference of the modern tool steel to heat is encrusted with chemical formulas, the effect that is brought about in making the steel is to require high temperatures to affect it in everything that is done to it. In the blacksmith shop the steel must be brought to much higher temperature for forging and also for hardening and tempering than ordinary steel; if these operations are attempted while the steel is at temperatures that would be proper for working ordinary tool steel, the results would be the same as if an attempt was made to work the common steel at very low heats. So far as effects are concerned, high-speed steel is cold until it gets bright red hot—which is a paradoxical statement that just about covers the ground.

How Benzol Affects Some Carburetters.

Benzol has been found to affect the adjustment of carburetters having cork floats by dissolving the shellac coating from the cork and allowing the float to become soaked and heavy. If benzol is used in such a carburetter, some such trouble should be looked for.

24 CARS READY TO START IN TOUR TO GLACIER PARK

Ninth National Reliability Tour to Have Hotel Train, with Repair-Shop and Daily Paper — Itinerary and Starters.

It looks very much as if a team of light cars would win the Glidden team trophy in the ninth National Reliability Tour of the American Automobile Association which follows, the city from which the entrant hails being sandwiched between the entrant's name and the car he will drive—or ride in:

L. W. Hill, St. Paul (Packard); L. H. Fawkes, Minneapolis (Premier); Harry F. Legg, Minneapolis (Stutz); L. H. Fawkes, Minneapolis (Marmon); G. H. Voter, Boston (Metz); Charles Metz, Waltham, Mass. (Metz); G. W. Walter Metz, Waltham, Mass. (Metz); Northwestern Automobile Co., Minneapolis (Krit); Northwestern Automobile Co., Minneapolis (Krit); Northwestern Automobile Co., Minneapolis (Krit); Dr. A. C. Smith, Devil's Lake, N. D. (Kissel); L. C. Erbes, Merriam Park (Velie); R. W. Munzer, Minneapolis (Hupmobile); R. W. Munzer, Minneapolis (Hupmobile); R. W. Munzer, Minneapolis (Hupmobile); J. O'Brien, Minneapolis (Moon); E. B. Stimson, Minneapolis (Little); Dr. E. W. Humphreys, Moorhead (Chalmers); Lewis C. Newlon, Fairmont, N. D. (Maxwell); E. A. Everitt, Waseca, Minn. (Locomobile); F. J. Flynn, Minot (Chalmers); Dr. J. R. Pence, Minot (Ford); Miss Minnie Butchard, Hibbing, Minn. (Velie); Dr. J. D. Park.

leads for the most part over roads that are entitled to the designation; the heart "rendering," as some one has said, stretches that were encountered by those hardy individuals who made the trip from New York City to Jacksonville, Fla., two years ago, may be remembered, but it is promised that nothing like them will be encountered, though that part of the Northwest never was famous for the goodness of its roads. And though the total mileage is nearly as great as it was on that memorable trip, it has been split up into what some persons consider fairly easy jaunts. The longest

SCENIC AUTOMOBILE HIGHWAY THROUGH VIRGIN FOREST IN GLACIER NATIONAL PARK

scheduel to start from Minneapolis, Wednesday, to-morrow, Friday, and which will end up eight days later at Glacier Park, Wash. For there are only three teams entered so far, and they are all of them made up of the lightest of light cars; one of them is a team of Metz cars, one is a team of motorcycles, and the other is a team of Hupmobiles. As was the case two years ago, the tour is to be run under Class E, Grade IV., touring rules and, unlike last year's abandoned event, 24 participants actually have "signed up" and it is altogether likely that all of them will start.

According to the latest reports from the entry list which can be taken to mean Minneapolis, the complete list of entries is as

If all of the 24 start, it is logical to assume that nearly 100 per cent. of them will finish, for the route that has been selected

single day's trip will be 194.6 miles—between Fargo and Devil's Lake—and the shortest will be 124 miles—leading into Fargo from Alexandria on the other side. The complete itinerary with the night stops and mileages, is as follows:

July.	City.	Miles.
11	Alexandria, Minn.	144.4
12	Fargo, N. D.	123.8
13	At Fargo, N. D.	
14	Devil's Lake, N. D.	194.6
15	Minot, N. D.	135.6
16	Williston, N. D.	136.8
17	Glasgow, Mont.	163.8
18	Havre, Mont.	156.1
19	Glacier Park, Mont.	178.0
	Total	1,233.1

In marked contrast to the tour of two years ago, when the tourists were left pret-

Digitized by Google

ty much to themselves to get hotel accommodations at the various night controls—and were lucky if they got a bath—comfort will be the keynote of this year's jaunt, thanks to the active interest of Louis W. Hill, chairman of the Great Northern Railroad's board of directors, who himself has entered a car in the contest. No one will be at the mercy of first-, second- or third-rate hostelries; the hostilry is going right along with the tour. It is a special 12-car train of Pullman cars, with the accent on the "pull" in the form of a giant Mogul locomotive. In that train there will be berths for all who want 'em—at $1.50 per; also, three square meals a day will be served, and for those who meet with difficulties by the wayside there will be a repair shop on wheels that will be complete even to a medium-sized welding plant and forge. The popular stunt of printing a daily paper en route has been "crabbed," too, and the "Glacier Park Blazer," as the sheet is to be styled, will appear nine times before it flickers out of existence.

In the matter of entertainment, the "Twin City-Glacier Park" tour, which is its other name, will require no apology. All along the route preparations have been made by civic bodies and boards of trade and automobile clubs for "stunts" that are practically certain to get their respective names in the "Glacier Park Blazer." And—s-h-h!—arrangements have been made to illuminate the murky heights of the marvelous Rocky Mountains for the edification of the jaded tourists. The Aurora Borealis will not be used for the purpose.

As usual, entrants have been recruited from among amateurs and professionals alike: and any car is eligible and has a perfectly good chance to win either the National Touring Trophy for driving the touring car that completes the distance with the least number of black marks—they will be dealt out only for time lost on the road—or the Anderson trophy, for driving a roadster home with the cleanest score. Besides, there is the Glidden trophy for the team that makes the best score, and there are individual prizes for those who head the various divisions, according to the A. A. A. price classification scheme.

Declares Ban on "Automobile Masher."

If the "automobile masher" is to operate with any degree of safety in Detroit hereafter, he will have to be unusually careful, for this type of car-operating individual has been recognized by the police department and a squad of motorcycle patrolmen is on the trail. If the term is at all vague it may be stated that this is the name Police Commissioner Gillespie has applied to men who "creep along the curbs in their cars and try to pick up girls."

NEW JERSEY MAKES RECORD FOR FREAKISH ACCIDENTS

Car Climbs Into Porch and Sets House on Fire—Driver Blinded by Paper Souvenirs Crashes Into Culvert.

The State of New Jersey already has a reputation for producing freak insects and legislation, but now it has come into the limelight as a producer of freak accidents, two having occurred last week on the same day; both, of course, were automobile accidents, and the results of one were more or less serious.

D. T. Oakley, of 77 Day street, Orange, was driving through Red Bank with his wife and three daughters when the tourists passed a stage coach loaded with employes of a factory who were scattering small paper shields to advertise their outing; the shields, fluttering down into the front compartment, blinded Oakley, who collided with a culvert, threw his wife against a telegraph pole and otherwise bruised and injured the others in the party.

The "freakiest" of the list, however, is that in which a party of motorists set on fire the residence of Morris Liptak, of Athenia, near Passaic. Liptak was slumbering peacefully in the early morning when the tourists approached at high speed; for some not stated reason the car left the road, crashed into Liptak's front porch, the gasolene tank sprung a leak, the gasolene caught fire, the fire attacked the front porch and before the situation was in hand several hundred dollars' damage had been done to the house. After volunteer firemen had extinguished the blaze and the car had been repaired so it would run, the motorists promises to send Liptak a check to indemnify him for the damage done, and drove on.

Negro Napoleon's Stunt Leads to Jail.

"Stunts" by colored chauffeurs do not seem popular in Nashville, Tenn., especially when they are of the type pulled off one day last week by 17-year-old Napoleon Haley, and Napoleon, too, is convinced by this time that perhaps he merited the treatment he received rather than the applause he expected and sought. He was arrested on a charge of reckless driving, although Napoleon can't figure out why that should be, since he didn't drive the car at all.

Napoleon conceived the grand idea of this "stunt" while he was about to start his employer's car on 8th avenue, near Broadway, and he no sooner thought of it than he set out to put it into execution.

He reached over into the front compartment, gave the car a little "gas," put the gears in mesh, turned on the engine started and then, while the car rolled down the street Napolean proceeded to light a cigarette. After the cigarette was lighted and the car had secured quite a start Napoleon proceeded to demonstrate his ability as a sprinter and started after the car. He caught it—but a "copper" caught Napoleon, too.

The police stated that had the car gone a few feet further it would have been beyond the powers of Napoleon to catch it and that it undoubtedly would have done considerable damage. Napoleon, like his historical namesake, had a lofty ambition but he took some tumbles and still is in a dazed state of mind as a consequence of his rapid downfall.

Iowa Tag Situation to be Tested.

Does the verbal permission of the secretary of State give a man the right to operate his car without a license tag? is a question which is agitating a part of the State of Iowa and has resolved itself into a test case wherein O. C. Stubbs, a travelling man, of Iowa Falls, Iowa, is the "tester." Motorists in that section of the country are watching the matter with interest, as Stubbs's case so nearly parallels what is quite likely to happen in any State in the Union.

While in Des Moines one day last week Stubbs bought an automobile and immedipately applied for a license tag, but was informed by the clerks in the secretary of State's office that no tags were available and that he could run his car home without one; Stubbs took the official's word and started and had nearly reached his residence when the chief of police of his home town arrested him for operating the car without a license. Stubbs protested, but to no avail, and it has now been decided to secure judicial light upon the extremely vexing question.

Detroit Turns Tables on Traffic "Cops."

Not contest with being watched by the police, the Wolverine Automobile Club, of Detroit, has set out to watch the guardians of the law, and as a first move in this direction has empowered President Charles A. Pfeffer to name a committee of ten to do this work. The move is not wholly on the club's initiative, for the police commissioner has asked that it be done, and with a view to making the department more efficient in its traffic work. The committee will watch the traffic police, ascertain how they perform their duties, suggest remedial legislation and report infractions of police rules to headquarters, all for the good of the community and the betterment of the service.

LOST ILLUSIONS OF A MOTOR TRUCK AGENT

What Happened When a Seeker for "Business Opportunities" Broke Into the Commercial Vehicle Trade—Skeptical Prospective Purchasers Who Needed Much Convincing—Door to Success Has Narrow Opening.

"Pretty nice business," remarked the Innocent Bystander, as he stood on the freight platform and watched the freight-shed huskies unload half a dozen clean, bright, new motor trucks and roll them into an imposing row to await the arrival of the dealer's men. "A fellow goes out and gets a few orders, transmits them to the factory and along come the trucks, which are turned over to the owners while the dealer adds his pocket with a fat little commission. Nice, clean business!"

More Rocks than Roses in the Path.

Maybe it looks that way. Maybe there are dealers who breeze through their work in a style that almost approximates what the Innocent Bystander figured that it ought to. But if so they keep well under cover. They don't advertise their troubles, as a rule, but there are few who are not aware of the fact that a dealer's path is not carpeted a foot deep with American Beauties. It is not noticeably stretching the truth to say that the average dealer feels pretty well satisfied with the way things are going if the rocks in the road are not too big and jagged to be climbed over.

It was not very far in the past that the man who used to be an Innocent Bystander, but isn't any longer, found out these things and more, too. He was looking around for some "nice, clean business" to occupy his mind and his time and keep his money working, and he permitted his roving eye to hover approvingly on the commercial vehicle industry. To make a short story short, he got an agency, an office and a couple of men and, after providing a place to store commissions, set to work to accumulate orders.

Hard Pushing to Start Ball Rolling.

He had no demonstrating truck. The advantages of the machine he represented were so obvious and so far superior to all others that it didn't seem necessary. Besides, if anyone wanted to see a truck they could just as well wait a bit until the first few were delivered and then see them actually doing regular work. And the factory people agreed that this idea was surely all right. What good does it do, they argued through two closely written pages, for a man to see a machine doing stunts around the street? He wants to see a machine at work, not just "showing off." Certainly; get an order, get the truck in service and get the owner to let the prospects come and look at it and ride on it, if they want to. With our trucks, they concluded, this ought to be sufficient for anyone.

Somehow the prospects that had been lined up, figuratively, before real work was commenced, seemed to lose much of their interest when it came to asking them to sign an order and a check in exchange for a comprehensive course in catalogues. They admitted that doubtless the striking advantages of the machine were actual and workable; but those other fellows who also wanted to sell trucks smiled loftily and, in a few well-chosen sentences, shattered the theories so confidently put forward. The prospect would argue that he was no engineer, and that for all he could see both fellows were telling the truth and both were right in their conclusions. They both knew more than he did about their own machines, and who was he, that he should contradict either of them?

Things that Competitive Salesmen Did.

This sort of thing exasperated the agent, who had the utmost faith in his machine—even though he never had seen one that was less than a couple of years old—and he began to reflect a little bitterly on the very ungentlemanly conduct of some of his competitors. There was no particular reason why they should take the pains they did to dig up theoretical objections to his truck—except that the prospect usually wasn't in a position to contradict them, even if he wanted to. And there was even less excuse for the concerns that supplied their salesmen with neatly arranged lists of dissatisfied owners of trucks, so that even if the salesmen so armed couldn't make sales themselves they often could spoil sales for someone else. And they did, too. And they seemed to have no sporting instincts at all, for they refused absolutely to give the would-be factor in the business a single chance to get a foothold, if they could prevent it.

Altogether, the rosy hues that at first were so plainly visible began to fade a bit, and there were times when the agent was not sure that the color was not a dull brown. So one day when a prospect got to the point of signing an order and paying his deposit—even though he put it up to the agent good and hard in the matter of fixing things that might happen after the truck got to work—there was general rejoicing and the sunshine once more was bright and the world a good place to live in. With a machine to show just what it could do, all this knocking business would be put a stop to, and there would be business doing.

Planned a Party for His Prospects.

As the agency force was familiar with the machine only in a theoretical way, the factory agreed to send down a man with the first car and give it a real good start. The man came down a day or two ahead of the machine—an intelligent, practical man who knew his business. The arrival of the truck was to be made a sort of gala occasion. The agent, who really had succeeded in deeply interesting a number of prospects, arranged to invite them to the unloading of the truck, so that they could see the machine just as it came from the factory and could, if they chose, ride back to the office on it and observe its advantages to some extent. It would be a good scheme to get a little bunch of really interested ones together; they would, of course, talk about the machine, and probably get to boosting it among themselves, and get up a little enthusiasm of their own accord, which they would carry away with them.

Factory Man Calls it all off.

The stenographer was getting ready a batch of gracefully worded letters of invitation to the unloading, to be followed by a little snack, when the unfeeling factory man put the kibosh on the whole thing. How did anyone know what sort of shape the machine would be in when it arrived? How could anyone know that the fool factory wouldn't send it without a carburetter, or something equally embarrassing? Who could tell what might happen to the car on the road? In fact, when the factory man got through the agent forgot his projected celebration and began to pray for a whole, undamaged truck.

The agent lived to thank the factory fel-

Digitized by Google

low, and he didn't have to live very long for that particular purpose. On the day when the truck should have arrived came a telegram stating that it had been impossible to get an end door car, but that one would be placed next day without fail. And about a week later the truck actually was shipped. It was delayed in transit and took a week to make a two days' journey. By the time the railroad people came up with the notice of arrival the agent was just beginning to wonder how a poor devil could live through the delivery of a dozen trucks, if a single, lone machine was capable of making so much trouble. He learned the answer later.

Another Exhibition of Foresight.

The factory man got on the job bright and early and found, first, that someone, probably a railroad employee, had turned the dual ignition switch to the battery side, and the good old battery had been industriously discharging through the coil, which was nice and hot when the experienced factory man felt of it, as he was in the habit of doing to see if the factory people followed the strict order to disconnect one battery terminal on all shipments. The motor was too big and too new to spin and start on the magneto, so there was a good, long delay while someone chased across town and got a new set of dry cells. But the time did not hang heavily, for one of the brakes was disconnected, a couple of steering gear pins were without split-pins and on the verge of falling out, the gasolene pipe was full of dirt and one of the petcocks on the engine was wide open and the handle broken off short. The factory man attended to all these and several other things philosophically and quite as if they were in the regular program—which they were, more or less.

The wily factory man insisted on running the machine around without load for a day before putting it to work, and about every half hour he stopped to fix something—that is, during the early part of the day. Towards evening the troubles all seemed to have come to the surface, and the machine, which really was a fine one, behaved the way it was intended to behave.

Pious Hopes of Horse Drivers.

The following day the truck went to work. As the agent expressed it, "apart from the fact that the machine was put into an open-ended shed with a leaky roof, muddy floor and sagging walls, with no one to look after it but the stable men who 'hoped it would bust' because it seemed to threaten their jobs, and the gasolene supply station half a mile away, and apart from the fact that every night something was stolen off the machine until there wasn't a tool left and it even looked as if attempts had been made to 'lift' the engine, the machine was well provided for." It was the first motor truck that had been introduced in a business that had been using horses for 50 years, and used a lot of them. Almost without exception the drivers, the stablemen, the foremen and the office force were antagonistic—when no one was looking.

When the agent or his people, or the "boss" from the main office, was around, they were suspiciously loud in their praises of the machine, with occasional profound regrets at unavoidable delays, blockades and so on. Anyway, between them, and in spite of the fact that the factory man stayed with the machine for a week, the showing made was decidedly poor, and it was only by producing a minutely itemized record of loading, unloading, running and delay times that the agent was able to show that the fault was somewhere else than in the machine. He worked a whole day to get his report in shape, and wrote a masterly letter, analyzing it and showing clearly just what the truck could do if it had a chance. Next day he appeared before the "big boss" with the documents, and laid out his facts in convincing array.

Gilded Palace for the Machine.

The new owner of the truck rubbed his chin thoughtfully. "H'm!" he said, with a light in his eye that the agent thought boded ill for the miscreants who dared to impede the machine. But he was wrong. "H'm! Just what I thought. The motor truck isn't ready yet for such service as ours. Well, if you've got to have a Brussels carpet under your machine and a stained glass roof over it, and a squad of policemen to watch it, I suppose I'll have to provide them, as long as I've paid for the thing." And the "boss" went to work and filled in the end of the shed, covered the roof with paper and tar, put some old planks on the floor and found an ancient stable padlock for the door.

But ultimately things really did get better and the truck made good to such an extent that it was followed by three more, all housed in a real garage with a real mechanic to look after them. Nevertheless, the dealer did not succeed in reaching the point where the path was rose-strewn. Certain peculiarities of his car, which were his talking points, induced his competitors to call the machine a "freak," and this caused the agent much sorrow and some loss of business. And queer things kept happening.

For instance, a big contractor, who had been the firing-point for truck dealers for several months, finally arose in wrath and invited all the salesmen to get together in his office and fight it out among themselves while he sat by and listened. And they did. It was certainly a grand scrap and as the sale hung on a point that was covered by the agent's machine better than any of the others, things looked rosy. One dealer, after failing to throw down the arguments in favor of the "freak," arose in disgust and told the prospect that if he wanted to experiment with fantastic junk-piles it was his own funeral, and walked out. But the agent for the "freak" was recalled as the whole party was leaving and, being asked for prices, terms and a lot of other information, naturally felt that he had about made the sale.

He hadn't. For some reason the prospect did not buy that or any other truck, and to this day he is still using horses. Why, no one seems to know. But it is supposed that the almost universal chorus of knocks brought the conviction that none of the machines were much good if they were open to so much criticism.

In the end, the long, hard fight the agent made brought about a very fair measure of success, and the time came when he even laughed at his own early experiences. But long before that period was reached he had found out that the "nice, clean business" was—well, one couldn't say it wasn't a nice business, and for the most part it was a clean business, but it was not what he thought it was when he first used the expression, standing on the freight platform.

Useful Tool for Irregular Cutting.

A tool which is extremely useful for cutting irregular forms from thin sheet metal, gasket material, paper and the like can be made like the well known glass-cutter with a sharp-edged little wheel. The cutter wheel, however, should have a diameter of about three-eighths or half an inch and should be mounted in a good, heavy handle, on a heavy spindle, so that it will stand considerable pressure. For the wheel a small knurling tool blank answers very well. It should be thin, so that there will not be too much material to remove in forming the cutting edge. The edge may be formed by holding the disk against a grindstone or emery wheel in such a way that the edge is beveled, the disk rotating at the same time by friction with the stone or wheel. The angle should be about 35 degrees for general purposes. This will give a good, sharp edge but one that will not readily break or chip off.

Such a tool is very useful for following an outline previously marked off, or it may be used in following the edge of a template or pattern. It is easily kept running straight or in a uniform curve and, if well made and properly used, will leave a clean, smoothly cut edge.

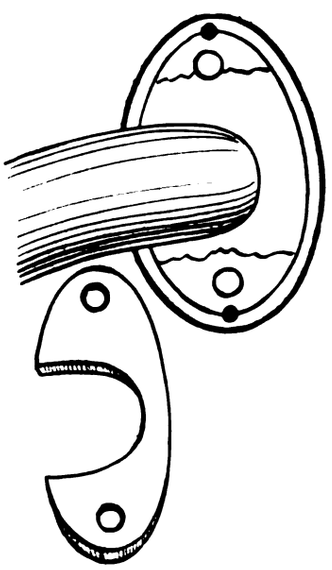
HOMELY PATCHWORK REPAIR PROLONGS OLD CAR'S LIFE

Broken Flanges that Were Clamped Together and Put Back to Work — Repairman Doctors His Own Car—How he Did it.



Old though the car was, and lacking in many of the refinements that mark more modern machines, Jimmie liked it for several reasons. One was that there was real good stuff in the old engine, and fine workmanship—and Jimmie knew, because he was a repairman of experience, and if there was a machine screw or a split-pin in that car that he hadn't examined at one time or another and mentally catalogued, it would be a long hunt to find it. Another reason was that Jimmie had had the machine for a long time and had become sort of attached to it, "like a barnacle," he said himself. And in the last place, Jimmie never could have possessed himself of a car of any kind as cheaply as he had bought his old "mill," for he had bought it while a blackened, fire-seared wreck from the insurance people for a mere ragtime, and had spent all his spare time for a whole winter in putting it in running order. True, the new tires nearly broke Jimmie; but by investing in "seconds" he managed to get his car on its feet. The whole thing was a succession of lucky chances, and Jimmie knew that if he let the car go he never could get one nearly so good at the price he could pay.

So as Jimmie was constrained to own that particular car or none at all, he did not even dream of running it off the end of a pier into the river when the two brackets that supported the long exhaust pipe and the muffler gave way, all unnoticed, and let the weight come on the flanged joint between the exhaust pipe and the exhaust manifold and on the manifold itself, breaking the exhaust pipe flange and one of the cylinder flanges of the manifold. New parts were out of the question, because they were out of existence, so far as Jimmie knew, and a new manifold—the bare thought of the expense of a pattern and casting made Jimmie shudder. So he went to work, in his spare time, and it was not very long before he was again on the road with a pound or two of added weight in the shape of repair wrinkles.

The cylinder flange was the one that bothered Jimmie the most, because it was a mean break—two breaks, in fact, as shown in the accompanying drawing, which was made with Jimmie's sketch on a piece of galvanized sheet iron as a basis. If the problem had been merely to hold the flange—what was left of it—against the cylinder, the job would have been a comparatively easy one; but the joint had to be gas-tight.

Jimmie sighed for the welding devices that were not within reach, and then, shaking off his regrets, reasoned it out. As he couldn't have a new flange made or the old one welded, the old one must be held together in some other way. There was no chance to put in screws or pins edgewise, so there seemed nothing to do but "tie the pieces together with a piece of iron," as Jimmie soliloquized. And, in the end, that is what he did.

The flange was just over three-eighths of an inch thick and the breaks were so irregular that the pieces easily found their proper places when pressed together. Jimmie got a piece of iron rod three-eighths

EXHAUST MANIFOLD REPAIR.

of an inch square, cut off a piece long enough to make a band all around the flange, shaped it carefully to the shape of the flange and got the ends welded together. The band was left rather small so that it had to be smoothed and trimmed to allow of its being forced in place around the flange. A hole was drilled in each end, half in the flange and half in the band, a tapered pin driven in each hole, until the band was drawn very tight and the broken pieces forced hard into their places. The pins were sawed off, leaving about a sixteenth of an inch at each end to be riveted over into slight countersinks and then filed off flush and smooth.

When the job had progressed thus far Jimmie liked the looks of it so much that he was tempted to bolt the manifold in place just as it was; but his cautious instincts prevailed, and he made sure that the parts would stay together when bolted up by cutting a piece of stiff steel 3/32 of an inch thick of the same shape and size as the flange plus the iron band, but with a cut-out to fit over the pipe. When the flange was bolted up with the iron band around the edge and the steel plate on top it could no more get away than it could talk. And while the job didn't look so dashed handsome, Jimmie said, it didn't look so all-fired bad either, and certainly it held on and did not leak, which is all that can be asked of any repair job of the kind.

The pipe flange was an easier job, and Jimmie applied the same principles in repairing it. The flange was a round one, broken in one place only, and an iron ring was made to encircle it. The ends, instead of being welded, were turned out and drilled for a quarter-inch pinching bolt, the ends, incidentally, being hammered out a little to provide a sufficient width of metal for the necessary holes. The bolt held the broken piece firmly in place and a split steel washer, opened, put on the manifold over the flange and then closed up, made a top clamp, being drilled, of course, for the passage of the flange bolts.

The old car with these homely repairs is still bumbling around the streets of New York, and has been for two years since this job was done—and heaven knows for how many years before that. Incidentally, it is a concrete example of the way it is possible for a car to last, for, so far as the knowledge of man goeth, it is 11 years old—11 years of continual service with a fire, a fall off a bridge into a rocky gorge, and numerous minor accidents sprinkled in to relieve the monotony. Yet the old thing runs with real vim. True, there is a little shakiness throughout, but Jimmie says the car is merely "good and limber," and it certainly does not pound like most old traps. How much longer it will run even the owner refuses to prognosticate. It is known to Jimmie's wife, however, that the car is expected to figure in the repairman's last will and testament.

Necessity for Brake Adjustment.

There can be no doubt that the brakes of a motor car are the most important parts of it in case of emergency, though despite this fact comparatively little attention is paid to them by the average person; in a great many cases they are not touched from one season's end to the next, when exactly the reverse ought to be the case. They should be examined and adjusted whenever the car shows the slightest inclination to continue on its course against the will of the driver, as evidenced by a firm pressure on the brake pedal. Most cars are so constructed that it is quite simple to take up for brake wear and in the majority of cases the work does not necessitate the soiling of the operator's hands.

1,043,224. Check-Valve for Pneumatic Tires. Cyrus A. Haas, St. Louis, Mo. Filed July 24, 1909. Serial No. 509,423. (Ball check for tires.) 3 claims.

1,043,227. Automobile Attachment. Lewis P. Halladay, Chicago, Ill. Filed May 21, 1910. Serial No. 562,606. (Support for top bows.) 6 claims.

1,043,254. Internal Combustion Engine. Webber S. Russell, Chicago, Ill. Filed March 18, 1911. Serial No. 615,235. (Two-cycle motor with scavenging air valves.) 5 claims.

1,043,274. Attachment for Spark Coils. Chester H. Thordarson, Chicago, Ill. Filed June 29, 1908. Serial No. 440,845. (Vibrator and adjustment therefor.) 4 claims.

1,043,316. Automobile Bumper. John Hanna and Albert Henry Hanna, Troy, N. Y., assignors to John P. Randerson, Albany, N. Y. Filed Aug. 29, 1910. Serial No. 579,390. (Spring bumper.) 3 claims.

1,043,342. Carburetter for Gas Engines. Mark Musgrave and Claude E. Musgrave, Pittsburg, Kan. Filed Nov. 18, 1911. Serial No. 661,065. (Electrically heated carburetter.) 2 claims.

1,043,344. Engine Cooling Device. Yorgen Newman, Monroe, Utah. Filed April 8, 1912. Serial No. 689,273. (Thermostat-controlled cooling fan.) 4 claims.

1,043,373. Tread for Tires, etc. George Crosland Taylor, Heisby, England. Filed June 15, 1909. Serial No. 502,217. (Superposed layers of thin bias fabric on edge.) 3 claims.

1,043,399. Starting Device for Explosive Engines. Milton E. Cole, Akron, Ohio, assignor of one-sixth to Charles A. Smith, one-sixth to Albert Burnett, one-sixth to Edward L. Scrote and one-sixth to James R. Rowlett, Akron, Ohio, and one-sixth to Frederick E. Hoots, Cuyahoga Falls, Ohio. Filed March 2, 1912. Serial No. 681,301. (Air cylinder with rack-and-pinion piston rod, ratchet on shaft and spring return for piston.) 5 claims.

1,043,402. Tire. Alexander Crowe, Youngstown, Ohio. Filed May 6, 1910. Serial No. 559,769. (Tire armor of metal links forming a continuous covering.) 1 claim.

1,043,407. Pneumatic Tire. Alfred A. Dennis, Grand Rapids, Mich. Filed Feb. 24, 1912. Serial No. 679,551. (Tire with tread of rubber blocks separately attached.) 4 claims.

1,043,424. Tire-Removing Tool. Herman Hevey, Biddeford, Me. Filed June 15, 1912. Serial No. 703,964. (Cam-and-lever tire removing tool and rim clamp.) 1 claim.

1,043,454. Rotary Explosion Engine. William M. Myers, St. Joseph, Mo. Filed Oct. 26, 1911. Serial No. 565,947. (Revolving cylinder motor with pumping cylinder.) 6 claims.

1,043,460. Auto-Fender. Artie L. Raven, Vista Grande, Cal. Filed March 27, 1911, Serial No. 617,251. Renewed Sept. 9, 1912. Serial No. 719,413. (Fender of the pick-up type with operating means.) 5 claims.

1,043,493. Universal Joint Coupling. Stanley Whitworth, Indianapolis, Ind., assignor to American Motors Co., Indianapolis, Ind., a corporation of Indiana. Filed March 28, 1912. Serial No. 686,885. (Disk-shaped cross members in place of the usual trunnion arms.) 4 claims.

1,043,4999. Transmission-Gearing. Warren W. Annable, Grand Rapids, Mich., assignor of one-fourth to Fred Z. Pantlind, Grand Rapids, Mich. Filed Feb. 20, 1911. Serial No. 609,636. (Peg-toothed pinion meshing with holes arranged in concentric circles on a disk.) 13 claims.

1,043,537. Two-Cycle Combustion Engine. Lafe V. Pence, Indianapolis, Ind. Filed April 29, 1909. Serial No. 492,855. (Two-cycle motor with valves and two-diameter cylinders.) 7 claims.

1,043,583. Gas Engine. George E. Forry, Brunswick, Md. Filed June 3, 1911. Serial No. 631,122. (Means for pumping air with one cylinder of a gasolene motor.) 3 claims.

1,043,589. Rotary Internal Combustion Engine. Louis Haubner, London, England. Filed March 30, 1912. Serial No. 687,339. (Revolving cylinder motor with crankshaft also revolving but in the opposite direction.) 1 claim.

1,043,595. Apparatus for Starting Internal Combustion Engines. Gottlob Honold, Stuttgart, Germany. Filed May 23, 1911. Serial No. 628,984. (Priming starter with pump for withdrawing old charge before introducing fresh gas. 5 claims.

1,043,642. Resilient Tire. Horace A. Stoneham and Carl T. Schwarze, South Orange, N. J. Filed Jan. 16, 1912. Serial No. 671,403. (Tire with spring tread and internal helical springs.) 1 claim.

1,043,658. Tire Rim. James D. Anderson, Kansas City, Mo. Filed Sept. 21, 1911. Serial No. 650,487. (Quick-detachable rim.) 4 claims.

1,043,677. Pneumatic Cushion for Vehicles. John Owen Davis, Pawnee, Okla. Filed May 23, 1911. Serial No. 628,936. (Pneumatic cushions in place of springs.) 7 claims.

1,043,692. Carburetter. Walter P. Grath, St. Louis, Mo. Filed Sept. 7, 1911. Serial No. 648,201 (Carburetter with annular air intake and automatic valves.) 9 claims.

1,043,702. Motor Vehicle. Russell Huff, Detroit, Mich., assignor to Packard Motor Car Co., Detroit, Mich., a corporation of Michigan. Filed March 20, 1911. Serial No. 615,588. (Means for supporting torque rod in case of breakage of connection.) 4 claims.

1,043,703. Signaling Horn, etc. Miller Reese Hutchinson, Bronxville, N. Y. Filed Dec. 13, 1905. Serial No. 291,518. (Electric horn with two diaphragms opening into one bell.) 5 claims.

1,043,704. Combination Alarm Device. Miller Reese Hutchinson, New York, N. Y. Filed May 4, 1910. Serial No. 559,330. (Horn with both bulb and electric vibrators.) 17 claims.

1,043,767. Gas Turbine. Hans Holzwarth, Mannheim, Germany, assignor of one-half to Erhard Junghans, Schramberg, Germany. Filed July 29, 1911. Serial No. 641,360. (Gas turbine with separate combustion chambers discharging on turbine.) 8 claims.

1,043,768. Gas Turbine. Hans Holzwarth, Mannheim, Germany, assignor of one-half to Erhard Junghans, Schramberg, Germany. Filed Oct. 13, 1911. Serial No. 654,486. (Gas turbine with separate combustion chambers discharging on turbine.) 16 claims. claims.

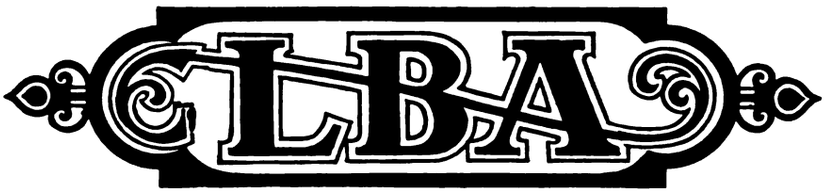
1,043,769. Internal Combustion Engine. Edward A. Hornbostel, Des Moines, Iowa, assignor to S. P. C. Gas Engine Co., Des Moines, Iowa, a partnership. Filed Oct. 16, 1911. Serial No. 654,822. (Motor with chambered piston through which exhaust gases pass.) 6 claims.

1,043,785. Rear Axle for Automobiles. Fredereick C. Miller, Cincinnati, Ohio, assignor to Napoleon Du Brul, Cincinnati, Ohio. Filed Dec. 28, 1908. Serial No. 469,524. (One-piece live rear axle casing.) 1 claim.

1,043,791. Lamp. William F. Anklam, Detroit, Mich., assignor to C. M. Hall Lamp Co., Detroit, Mich., a corporation of Michigan. Filed March 16, 1912. Serial No. 684,218. (Adjustment for parabolic reflector.) 4 claims.

1,043,805. Clutch. Elmer W. Crabbe, Bridgeport, Cann., assignor of one-half to Edward W. Harral, Bridgeport, Conn. Filed Nov. 24, 1911. Serial No. 662,100. (Clutch in rear axle casing.) 1 claim.

1,043,816. Internal Combustion Engine. Gilbert R. Elliott, Boston, Mass. Filed Aug. 23, 1911. Serial No. 645,582. (Rotary valve motor.) 7 claims.



1,043,820. Shock Absorber for Vehicles. George S. Foster, Pueblo, Col. Filed Oct. 21, 1911. Serial No. 655,960. (Pneumatic cushions above springs.) 1 claim.

1,043,827. Shock Absorber. Delbert Hartley, Los Angeles, Cal. Filed May 4, 1912. Serial No. 659,075. Shock absorber of the spring-pressed brake type.) 2 claims.

1,043,828. Vehicle Wheel. Jefferson B. Hayden, San Angelo Tex. Filed March 1, 1911. Serial No. 611,590. (Wheel with curved tangent spring spokes.) 6 claims.

1,043,868. Throttle Controller. James J. Quigley, Mamaroneck, N. Y. Filed Oct. 9, 1911. Serial No. 653,611. (Dashpot on accelerator.) 1 claim.

Storage Batteries

have been identified with electric lighting and starting systems ever since they first came into use.

Inventors realized the necessity of a reliable storage battery to furnish the initial energy required to operate their machines.

They sought and found it in GLBA Batteries, which kept pace with their progress, always advancing toward ultimate perfection.

That's why the GLBA is today the choice of the great majority of manufacturers of Electric Lighting and Starting Systems and of automobiles which use them.

Are You Selling Automobiles? Do you know one person who wants to own a car? Here is your chance —you will

Save Money

WE can not favor all of these towns, not even only one person in all these towns. We can accommodate only the first wideawake few who realize that here is an unusual offer. This offer is all the more exceptional when you consider the high quality of the National car and its years of leadership. It is the Stock Champion—and still holds the International 500-mile race record.

This proposition is a part of our far-sighted Expansion work. Do not delay – some one will snatch up your chance. This means profits for you. Write today for full particulars.

Elyria-Dean
TRADE MARK

Now the TUTO HORN is within the reach of every car owner

Improvements and Manufacturing in Large Quantities makes it possible to furnish the Genuine $25.00 TUTO for $15.00. This new price includes all of the Exclusive features that have made the TUTO horn so practical and popular:

$15.00

Two-tone Feature—Low note for regular service—loud note for emergencies—from one horn and one button.

Instantaneous Action—No loss of time for motor to "speed up."

Steering Wheel Fixtures—Protects the cord—gives neat, permanent job.

Button Always Under Thumb—Gives quick action in case of emergency.

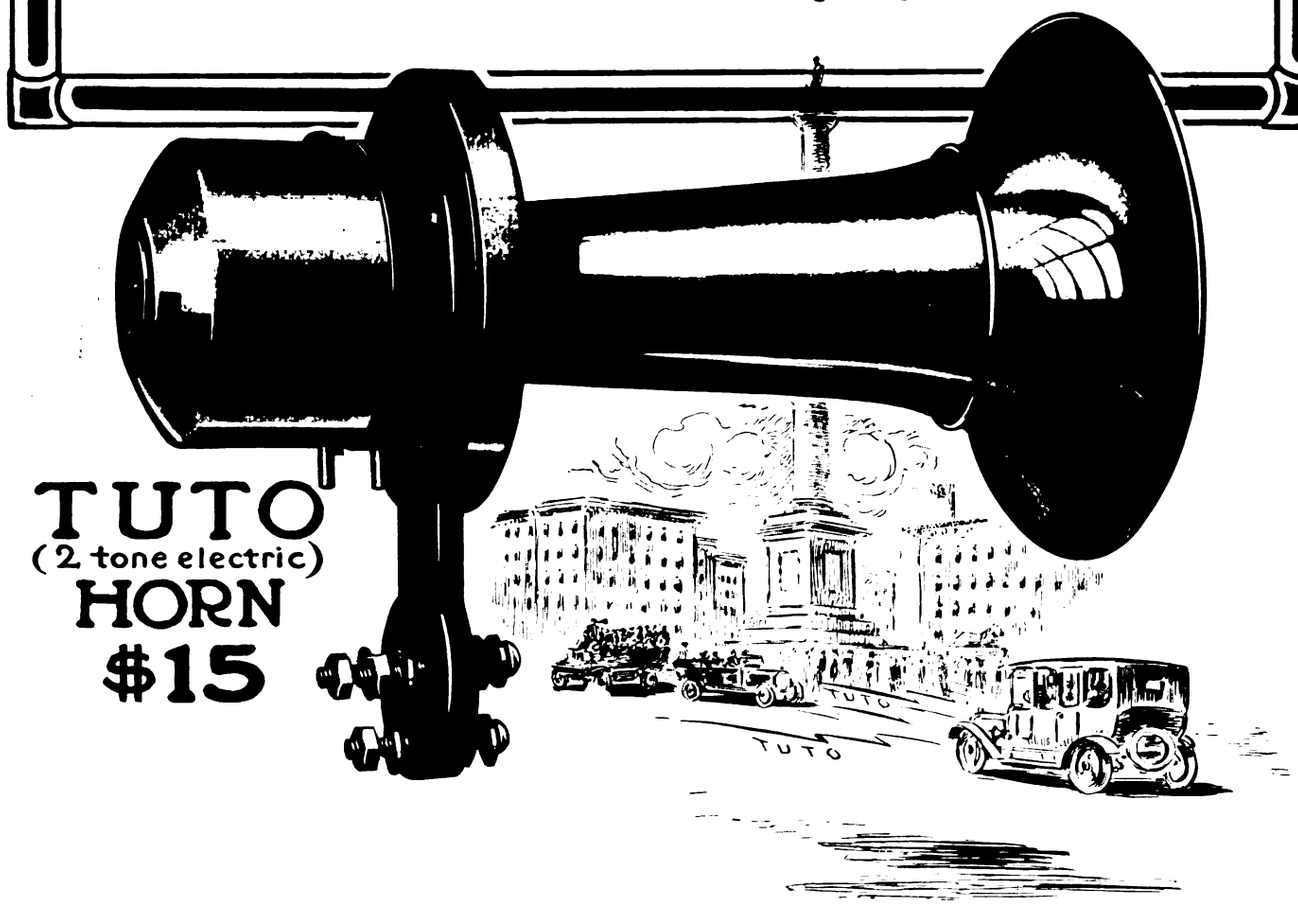
Automatic Operation—Unconscious gripping of button upon approach of danger forces button clear down and gives loud note—instantaneously. No hesitating, no selecting of horn buttons, etc.

Reliability—Always responsive, as same button, cord and horn are used for both notes, thus are self-testing. There is nothing to oil or clean, so neglect will not interfere with operation or ruin the working parts, the same as in mechanical or motor horns.

Liberal Guaranty—Guaranteed indefinitely against inherent defects or breakage of parts due to such defects. We always give the customer the benefit of the doubt.

No Experiment—The Tuto Horn has been marketed for three years and has given unusual satisfaction through its reliability and freedom from trouble. This is proven positively by our records, which show that we have been called upon by less than 1% of Tuto owners for advice or repair parts.

Once a Tuto User, always a Tuto Advocate



Tuto users never can go back to the old bulb horn or to the **Slow Accelerating Motor Horn.**

TRADE MARK

A High Grade Electric Warning Signal Guaranteed, $8.00

THE REXO HORN IS THE STANDARD EQUIPMENT HORN, evidenced by the number of manufacturers who furnish the REXO on cars they make.

Made from the best of selected materials, assembled by expert workmen in a well-appointed factory.

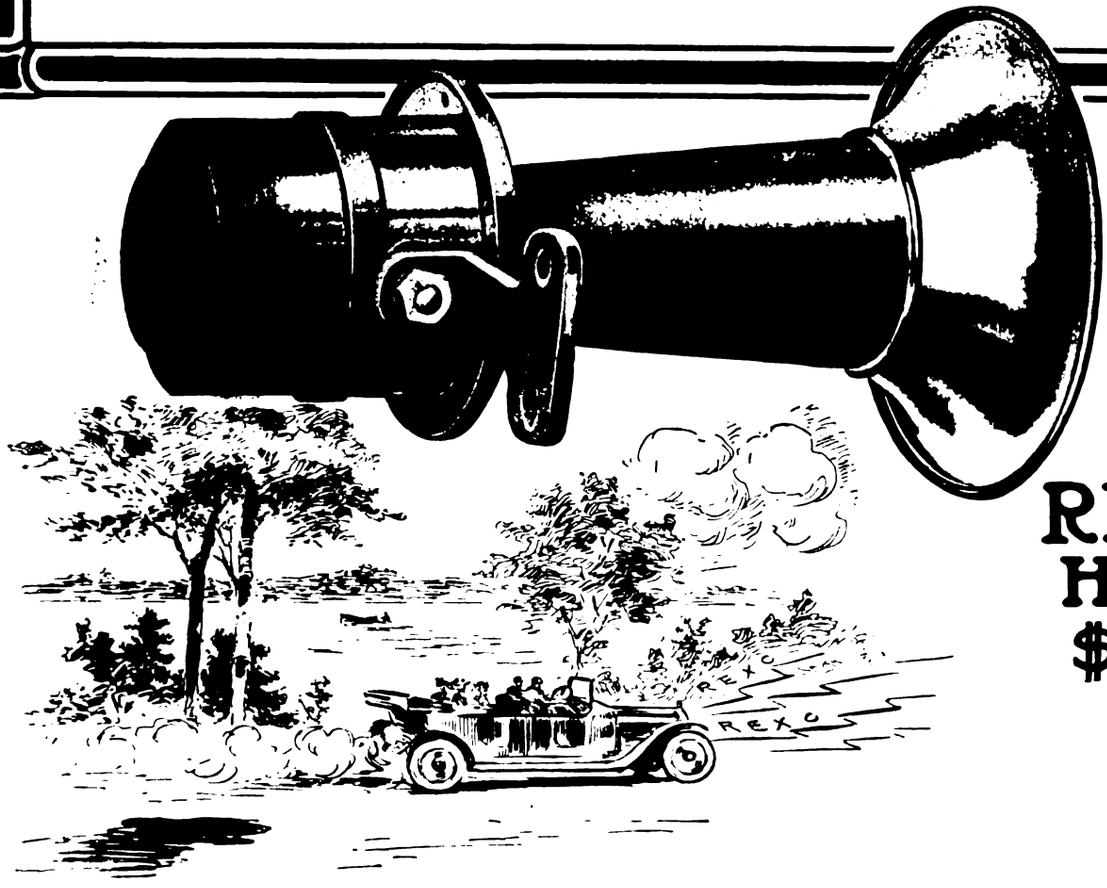
The action is instantaneous, always responsive.

There is nothing to oil or grease, nor is it necessary to clean in gasoline, as there is nothing to clog or congeal.

Guaranteed indefinitely against inherent defects or breakage of parts due to such defects.

We always give the customer the benefit of the doubt.

Your Dealer will demonstrate the REXO for you today.



DEALERS: Ask for our dealers' proposition—it is a winner!

MORE EFFICIENT SALESMANSHIP

is generally admitted to be

THE GREATEST NEED OF THE TRADE

MOTOR WORLD

is doing its part to render the need less acute by

"Improving the Breed of Salesmen"

One of its most recent efforts in that direction is the

Offer of Four Cash Prizes

$30 — $20 — $15 — $10

for the best four articles conforming to the title

"My Best Sale; How It Was Made"

The competition is open to everyone who ever sold a car, truck or accessory, but all articles submitted must be received prior to September 1st, next. Non de plumes may be employed, if desired.

If ever YOU made a sale of which you are particularly proud, now's a good time to prove it.

Arbeco Lamps

The Last Word in Lamps for Automobiles and Motor Boats

Here at last is a botherless lamp for the motorist—a lamp that throws a wonderfully strong, steady, clear light; a lamp which may be cleaned inside and out in half a minute by simply using a damp cloth; a lamp which may be finished to match the body of the car, or in gold, brass, nickel, copper, or any color; a lamp which requires **no burnishing** to renew its beauty.

Remarkable Exclusive Features of this Patented Arbeco Lamp

Both reflector and body are made of the highest grade of glass. The lamp is made by skilled workmen in such a manner that its durability is guaranteed. No metal comes in contact with the glass at any point. The outside finish of the lamp—gold, brass, copper, nickel, or any color—is put on under the outside glass. The reflecting coat is applied outside the reflecting glass—thus one or two rubs with a damp cloth clean both outside and inside, and it is simply impossible for the lamp to be scratched, clouded or tarnished in any way.

The ARBECO Lamp is always bright and **will retain its original lustrous finish and reflecting and projecting power forever.**

The ARBECO Lamp is absolutely impervious to heat, moisture and dirt.

The ARBECO Lamp cannot become hot from the sun's rays nor from the electric light within because of the **vacuum** between inner and outer body.

The ARBECO Lamp is from one to three pounds lighter in weight than any metal lamp.

The reflecting surface is designed on the principle of the true parabolic curve, projecting the most powerful ray of light possible from a point focus.

Fittings: True parabolic **silver mirror** reflector fitted flush to glass in door. Focal adjustment. Wired socket for bulb. Door and trimmings finished in high grade brass or nickel.

Automobile Manufacturers and Dealers in Auto Supplies:

Investigate the ARBECO Lamp—the most remarkable advance in motor lighting. Notice its attractive design, paraboloid shape and classy appearance. The severest tests over rough roads have not damaged it in the least. We manufacture in sizes to meet headlight and sidelight requirements of all sizes of touring cars, roadsters and runabouts.

Write us today for all particulars desired.

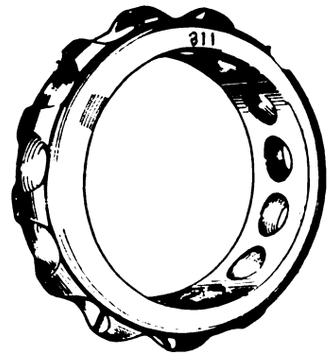
Ball Bearing Essentials

Full Complement of Balls
Full Depth of Raceways
Uninterrupted Raceways
Solid One-Piece Separator

CAPACITY GURNEY ENDURANCE



THE real merit of Gurney Ball Bearings is best understood when each of the four essentials is considered by itself as to the functions it performs; then in relation to the others and the functions they perform in the general scheme of a ball bearing.

EACH Gurney Bearing has a **Full Complement of Balls** so that its load capacity is in no way impaired. By the use of the Gurney one piece separator, it is practical to run the balls much closer together than with any other type separator.

EXHAUSTIVE experiments have demonstrated that a **Full Depth Raceway** 4 per cent. greater in radius than the ball brings about the most efficient relation between the two. Any variation more or less than 4 per cent. either decreases load capacity or increases friction. If the race contour be closer to the ball curve than 4 per cent. the area of contact between the ball and the raceway is increased and the friction correspondingly becomes excessive. If the raceways conform less closely to the ball curve the area of contact is decreased sufficiently to lessen the carrying capacity of the bearing without materially reducing the friction.

IT is obvious that **Uninterrupted Raceways** are superior to slotted or interrupted raceways of any type—for an uninterrupted raceway means a greater thrust capacity than one which is slotted; as well as being a superior manufacturing proposition from every viewpoint.

THE **Gurney One-Piece Separator** is die cast from special wear resisting alloy. The partition or septum between each pair of balls is so efficient and durable that it does not have to be so thick as to displace any of the balls and thus reduce the capacity of the bearing. Cast in one piece there are no joints, screws or clips to interfere with its performance, life or strength.

IN considering ball bearings always bear in mind that more important even than the obvious essentials mentioned above is the question of raceway contour—for just as far as you fall short of right contour just so much do you fail to realize the full efficiency to which you are entitled.

GURNEY BALL BEARING COMPANY

Jamestown, New York

MESHES ITSELF
UNMESHES ITSELF

Model B
Rushmore Starter out of action.

1913 — 1914
Starter Sales and Starter Profits

JUST PRESS
A BUTTON

Have you been counting on the demand for starters in these coming two years to lift your business out of a rut and save the profits of the lean years just past?

Are your hopes coming true?

Or is it costing the profits of two or three clean sales to keep an occasional customer satisfied?

If the harvest time of 1913 and 1914 passes with your balance sheet merely breaking even, how long is it going to take to make up those lost years?

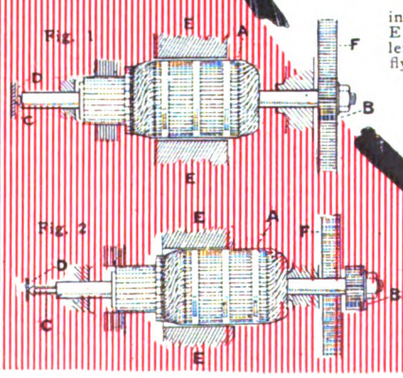
It isn't a question of **sales**, is it? It is a question of **profits**;—and profits come of cars and starters that **stay sold**.

The RUSHMORE STARTER

is completely automatic, yet it is automatic without mechanism. There's nothing to it but a foot-button switch and an electric motor! And the motor does everything, even to meshing and unmeshing with the flywheel gear, **automatically** and at the right moment after the button is pressed. The driver is not tempted to "monkey," and the motor is too simple to go wrong. Attention is limited to oiling:—even the commutator takes care of itself!

Compare the behavior and construction of the Rushmore Starter with the best starter you have ever before heard of, and consider which you would rather have on your cars.

The Rushmore Dynamo is as novel, ingenious, and simple as the starter. Write for information about both.



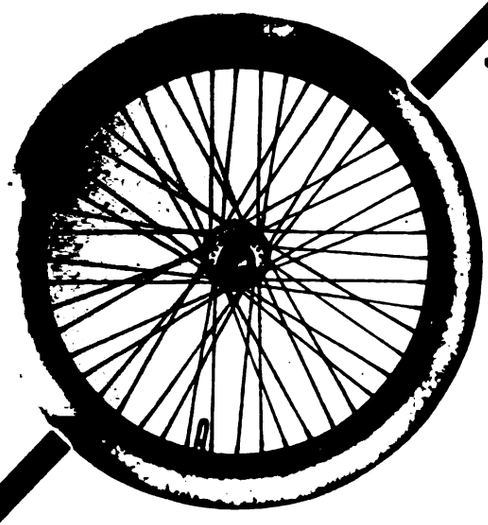


Fig. 1. The Starter in action. Pressing the switch button causes the poles E E to attract the armature A to the left, thus engaging the pinion with the flywheel gear.

Fig. 2. After the engine starts. The increase in speed, when the load is removed, kills the battery current for an instant, allowing the spring C to slip the pinion B out of mesh.

Rushmore Dynamo Works,
Plainfield, N. J.

Lindsay

Wire Wheels *for* Ford Cars

Many pounds lighter than your present equipment.

50 per cent. stronger by actual test.

Increase tire mileage 70 per cent.

The Lindsay Wire Wheel

(*Patented*)

Interchangeable with your present wood wheels. Require no adjusting or fitting of parts—simply take old wheel off and replace with new. Triple-spoked construction—best grade steel throughout. Patented design of rear wheel incorporates brake-drum with hub, insuring against play or looseness of any kind.

For further details, see your Ford dealer, or if he cannot supply you, write us direct.

The Lindsay Auto Parts Company

315 No. Pennsylvania Street
INDIANAPOLIS, INDIANA

Ford Dealers

Here is your opportunity to supply a demand already created by the proven superiority of the modern wire wheel. We have a sound and attractive proposition to offer you if you will write us. Take out your pen, fill in the coupon, and mail it to us before you forget.

How Moses Led the Multitude

Four years ago the Havers Motor Car Co. was organized to build what was then considered the impossible — a high grade, six-cylinder automobile at a popular price.

At the time the first Havers Six appeared there was not a single Six selling within twelve hundred dollars of the Havers price and our speedy funeral was predicted.

But the Havers organization had a new idea, a method different from anything yet undertaken in six cylinder construction.

We saw the mistakes the other Six manufacturers were making in trying to manufacture their entire car in their own plant.

We saw a tremendous non-productive investment in expensive machinery that could be kept busy but a fraction of a day.

We saw an overhead and a waste that put the Six, with all its superiority, within reach of the millionaire only.

We saw that nowhere was the old adage, "A Jack of all trades is master of none" so true as in the making of a high grade motor car.

So we drew our plans—plans that embraced all that was best in six cylinder engineering.

But instead of figuring on building the heavy, more vital parts of the Havers Six, we grasped an idea from what a few of the better Fours had just worked out to a big success, and called in a dozen of the best known specialists—men who are building single parts exclusively—men who were big enough to see the handwriting on the wall and anxious to be the first to enter the six cylinder field.

For days and weeks their engineers and ours worked side by side—experimenting, testing, perfecting—until the first Havers Six appeared—a car so trustworthy that it is still smiling after four strenuous years and a record of many thousands of miles.

Briefly, this is the story of the Havers Six, the pioneer, the leader of the sensibly priced sixes, the inspiration for a host of others that have followed the Havers trail, until today the popular priced Six is justly master of the market.

For we have proved our theory, that in every important part of six cylinder construction there are certain specialists who, through a greater market and a constant concentration of both their energy and capital on one product, can produce a better product for less money than can the manufacturer of a high grade car who is always confined to a limited output.

You know the record of the Havers Six, how its sales have jumped in every territory where it is represented.

While our present series of cars is practically completed, we are going to again increase our capacity and will shortly announce the season's plans. In addition to the always popular Six-44 and five-passenger Six-60 we will make a seven-passenger car and limousine. Demonstrators will soon be ready.

We will want more dealers—good dealers, who are looking for a Six—the oldest in its class, to back up their salesmanship with a car that will deliver.

If "imitation is the sincerest flattery," then we have every reason to be more than satisfied with the result of those carefully laid plans of four years ago for the Havers trail, so courageously blazed, is already assuming the appearance of a well beaten path and, as the pioneers of the moderate priced Six—built with specialized parts, we do not hesitate to share the credit for our success with the specialists whose names appear in the opposite page who aided us so well in pioneering this successful movement.

Test This Tire

Mr. Dealer, we want you, as a tire judge, to TEST THIS tire—the Cable-Structur. Test it out with any tire you THINK is equal. Put it to the most crushing tests you know. And compare Cable-Structur service with the service of ANY other tire.

The result will tell—the result will win you to Cable-Structur. We are sure of that. We know what QUALITY AND SERVICE is built into Cable-Structur at our factory. We know what this tire will do, and we want you to know.

More than 30,000 Mansfield tires have been tested out by motorists. And now the demand requires our utmost capacity.

Here are the reasons:

Quality Not Limited

Nothing is allowed to limit the quality of Cable-Structur. We sacrifice a large per cent of profit to give "the best tire in the world."

We use the most costly fabric and the finest rubber. This greatly increases our cost of making. Nothing is used that would cheapen this tire.

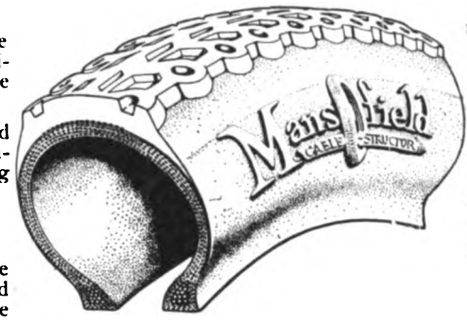
Costly Hand Building

We build every Cable-Structur tire by hand. That's the costliest method for us, but we use it because it's the **Best** method.

Our Hand-building assures the utmost accuracy. It assures perfection. It means that every inch of fabric is applied with unvarying precision. And that means uniform strength.

Experts Never Hurry

Our expert tire builders never hurry. That is not permitted. To avoid hurrying we pay by the hour, at highest wages. Thus we get the best efforts of every worker.



Highest Efficiency

You know what such careful, conscientious building means to both the Dealer and the tire user. And you appreciate how that great care multiplies our cost—cuts our profit.

But in that way we build **highest efficiency** into Mansfield Cable-Structur tires. And the average service to users proves the worth of our precautious methods.

The Logical Base

Cable-Structur base is the simplest and most logical used in tire making. 24 no-stretch, endless steel wires, 12 on each side, are vulcanized into the semi-hard rubber beads. That gives an inseparable unit of strength.

Mansfield
CABLE STRUCTUR

These 24 steel wires have a tensil strength of 16,800 pounds. So nothing can wrench the Cable-Structur tire off the rim, over the flanges. That base gives absolute safety.

Saves Rim-Ruin Costs

By using the Cable base, the clinch is not necessary on the base. The rim hooks are useless and are turned away from the tire. So with the rounded side of flanges next to tire, no rim-damage is possible

This invention, then, saves you rim-ruin, and its costs

Maximum Carrying Power

This compact base gives greater air space inside. That multiplies the carrying capacity, for the air cushion carries the load. That extra capacity cares for the overload and saves blow-outs.

These valuable features we give at no extra cost to you.

The No-Skid Feature

Note the No-Skid feature. Think how those heavy projections prevent skidding—and think how enduring they must be.

Remember, too, that we give a very thick plain tread below. This adds big mileage.

Both treads are exceedingly tough, very difficult to puncture, and highly immune to wear (made of finest rubber prepared by our special formula).

Tested 30,000 Times

Other men have already tested more than 30,000 Mansfields. You test Cable-Structur and see what others found.

The average mileage is between 7,000 and 12,000 miles. Note the mileage you get.

Control the Sale

Do you see why so many men demand this tire? Don't you see why you should sell it?

Get our special proposition and supply the demand for Cable-Structur.

You can control the sale. Start Now. We'll stay with you—and help you sell Cable-Structur. Write today.

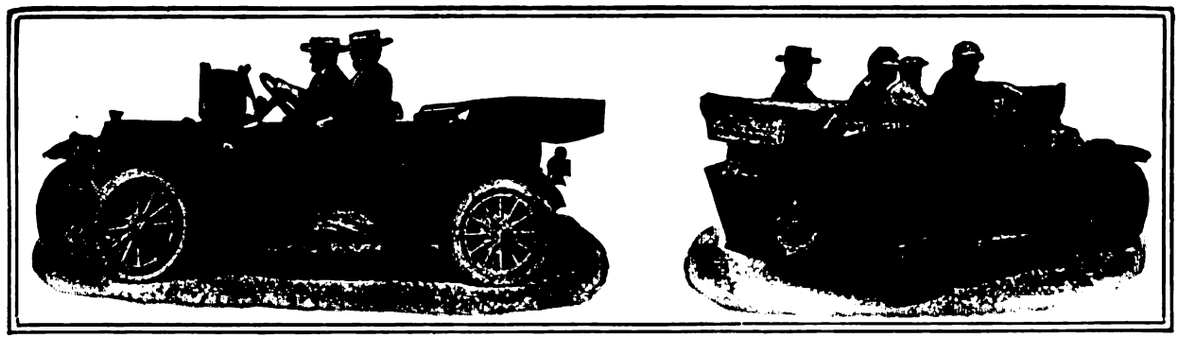
Materials, Workmanship and Deliveries As YOU Want Them

WE have open capacity for 1914 and invite your investigation of our facilities to handle properly your contract for axles for the coming year.

Metal Products axles have an unsurpassed record for endurance, silence, good appearance and excellence of finish. They have been used on a number of well known cars and exclusively on two of the most popular cars for several years.

For your 1914 cars buy axles that will help sell them. The good reputation of Metal Products axles will help boost your sales and add to the popularity of your cars.

Metal Products axles are made in both standard types and to specifications. Order what you wish and get deliveries when you want them. We assure you the finest materials and workmanship and deliveries as desired for either gas or electric pleasure cars.



Write us before placing your contract.

The Touring Success of the EMPIRE

EMPIRE, the Lightest Entry in the Indiana-Pacific Coast Tour.
Started July 1

The Empire five passenger touring car now on its way from Indianapolis to the Pacific Ocean is the lightest car of the Indiana Manufacturing contingent making this 3575 mile tour. It is the only popular priced car of the tour. It sells completely equipped for $950.00.

EMPIRE, Official Pathfinder and Pilot of the Little Glidden Tour.
Started June 23

The Empire was selected to blaze the trail for Iowa's Little Glidden. Through gumbo mud it plowed on schedule time. On June 23d it started the tour proper as the official pilot of this important endurance tour run under strict A. A. A. reliability rules.

It was the sturdy reliability and touring excellence of the Empire and its economy of up-keep and operation that brought the great flood of orders.

It is largely because of this that we are quadrupling our output for next season: and the increased production is under way right now.

Keep Your Eye on the EMPIRE--"The Little Aristocrat"

5-Passenger Touring Car, Completely Equipped $950.00

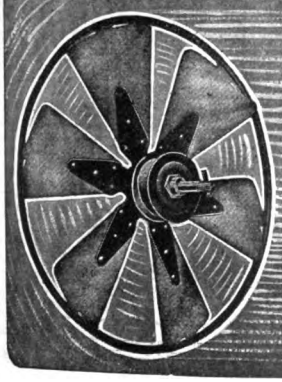
SPARTON

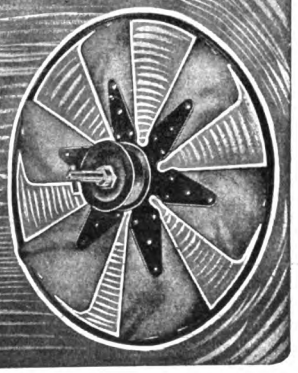
THE ELECTRIC SIGNAL DE LUXE

THE "SPARTON" WILL OUTSELL ANY OTHER MAKE OR TYPE OF ELECTRIC WARNING SIGNAL ON LOOKS, WARNING NOTE DELIVERED, CURRENT CONSUMPTION, GUARANTEE OR PRICE.

Dealers everywhere are adding handsome profits to their accessory business, for the "SPARTON" is the ONE logical warning signal that meets the owner's requirements.



It's RIGHT through and through and the price is no greater than you are expected to secure for Buzzer signals.



There is a "SPARTON" for every car, either dash or underhood model. Any standard finish. All the "SPARTONS" you want when you want them. One price to all Dealers, NO discrimination, NO exclusive selling arrangement.

PRICES $10.00 to $15.00

THE FAN BUSINESS WE DO PROVES OUR FANS ARE THE BEST.

Standardized parts not only increase manufacturing efficiency, but later duplication in case of accident is possible on short notice.
Antomobile Engineers in the designing of new cars universally indorse our ONE PIECE BLADE RADIATOR FANS. The QUALITY is known, and the cooling results are accepted as maximum.
In solving the cooling problems of most of the better car and Motor Manufacturers we oftentimes find it necessary to meet certain conditions heretofore unknown in other factories. In so far as is possible we build enough STANDARD sizes to meet any cooling requirement. The chances are nine in ten that we can meet yours without making a special job.
Our catalogue is pure gold to the Engineer, who would be interested in knowing what we know about Automobile Fans.
Our experience of years is tabulated in concise form. It is really a text book on cooling. It's FREE to you.

One of the Prime Features of the Motor is the Crankshaft

For on this forging, on its inherent strength and on the extreme delicacy with which it is "balanced" and "finished" depends much of the sweetness, power and durability of the motor.

It is impossible to have the machining and grinding of your crankshafts **too well done.**

Specifications and limits may be exactly the same and yet the products of two shops will vary. What is the answer?

The answer is—it's the "human element," which is never the same. To reduce the variability of the "human element" to the lowest possible point we have installed the most complete and up-to-date equipment of tools and jigs that the market affords.

Our Lathe Department and Grinding Department are as complete as experience can suggest. Our Finishing Department is equipped with machinery of exclusive special design, insuring utmost accuracy and speed on turning gear fits, cutting tapers, threading, drilling flanges and oil holes, cutting keyways, etc.

Our Tool Room equipment bespeaks selection with a view to extraordinarily close work on jigs, gauges and all shop tools.

We have been at it seven years—and that we **"know how"** is indicated by a growing list of STEADY customers who reckon quality more important than price. We will be glad to have you write us.

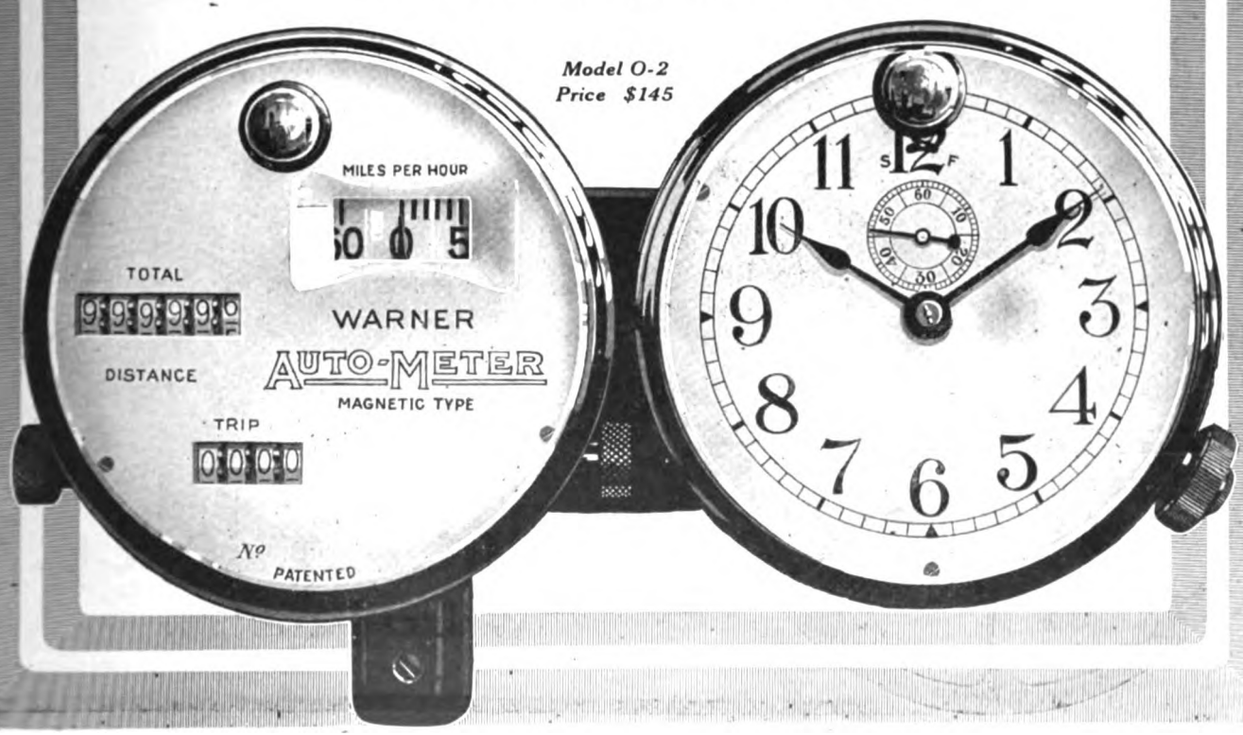
WARNER
QUALITY AUTO-METER

It costs double and is found on practically every high priced car made

THE Warner Auto-Meter is the highest priced speedometer made. Its association with practically every high priced automobile on the market is a clear indication of how highly automobile manufacturers regard and respect it.

If the car you buy is equipped with a Warner you can feel secure in your investment.



But the absence of the Warner on any high-priced automobile is usually a bad sign. It means the manufacturer is endeavoring to economize at your expense.

Look for the Warner. Insist on it. Take no other.

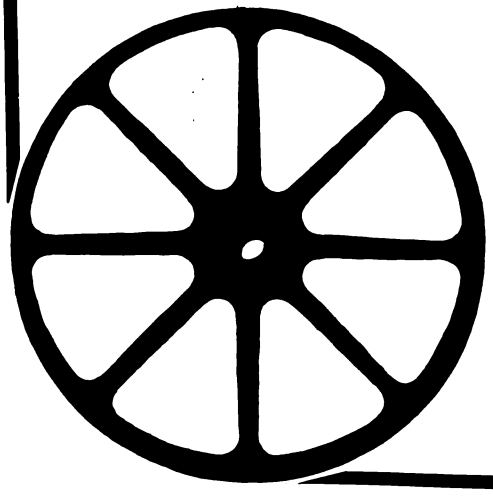
Truck tire bills

are one of the heaviest items of expense in motor truck operation.

They are reduced

by using the right sort of steel wheels.

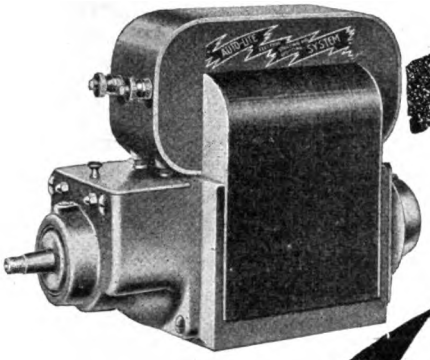


English Omnibus, With Steel Wheels

SHELDON
Steel Wheels

are more resilient than wood wheels. They permit uniform tire wear, because their periphery is always true. And they keep the tires cool, because there is no wood felloe to stop radiation.

If you are a truck manufacturer, you are interested in keeping down your customers' operating expense. Sheldon Steel Wheels will help you do it.



The London General Omnibus Co., the largest tire users in the world, reports the average life of the solid tires on the steel wheels of 2,000 buses to be 25,000 miles. The buses carry a 3-ton load on 34x4 inch front and 40x4 inch dual rear tires. On account of the frequent braking and starting the service is very severe. So far superior to any other type have the steel wheels proven that the number of buses carrying them is now being increased to 5,000.

Incidentally, steel wheels are not damaged by putting on or removing tires, or by the gradual disintegration of a built-up wheel under road shocks. They "stay new" indefinitely.

We shall be pleased to quote on receipt of blueprints showing your present wheels.

Sheldon Axle Co.

"As Sure as the Whirl of the World"

AUTO-LITE ELECTRIC STARTING and LIGHTING SYSTEM

The New Auto-Lite Electric Generator

Built with magneto dimensions—designed to be connected direct to the magneto or pump shaft—no extra transmission required.

Operates at 6 volts, beginning to generate at 200 R.P.M.

Attains maximum output at car speed of 17½ miles per hour.

Controlled by means of armature reaction and reverse series field—no regulators or relays to give trouble.

An Improved Generator for Automobile Electric Lighting

As you will see by referring to the illustration, the field is made of laminated soft steel, and the exciting coil is placed in a position to afford the best heat radiation.

The ***noticeable simplicity*** of the System is bound to appeal to you.

The armature runs in large ball bearings, and is lubricated by grease, thus obviating any necessity for frequent oiling.

Brushes, made of special carbon, connected with "pig-tails" are mounted on swinging brush holders which automatically compel a constant compensation for wear.

Both brush holders and commutators are very accessible.

Coils are impregnated, varnished and baked, and the whole machine is absolutely water-proof.

Weight of generator is 37½ pounds.

Ignition

The design of this generator is such that it can easily accommodate ignition apparatus.

For the manufacturer who desires lighting, starting and ignition in one system, we are able to provide the best recognized equipment now in use.

The Electric Auto-Lite Company

116 Michigan Street, Toledo, Ohio

THE ATTERBURY LINE

Atterbury Trucks have gained a reputation for economical running in practically every line of trade.

While many features of Atterbury construction have a bearing upon their economy of running and upkeep, the dominating factor is the proper proportionment of power in trucks of different and varying sizes.

Ten years of experience in building trucks have taught us the fallacy of using one size motor for varying sizes on the theory that as speed decreases loads can increase.

This theory does not seem to consider reserve power a necessary element of truck practice.

Atterbury theory and practice takes into consideration the tendency on the part of users to overload, the necessity to negotiate hills and hard pulling over bad roadways. In a word, Atterbury theory and practice increases power as loads increase.

The proper proportionment of power to load gives Atterbury trucks the characteristic economy in all kinds of service.

When you select a line of trucks to sell be sure to study the Atterbury line and Atterbury methods.

Our sales policy is liberal. Write for full information.

Jeffery-Dewitt SPARK PLUGS in the Making

Scene I. A section of the tool room. Here skilled tool makers turn out the jigs, dies, and tools used in the manufacturing department for making the component parts of *J-D* Spark Plugs. Extreme accuracy in these tools is maintained to insure uniformity in the entire product.

At 75c. These Two Plugs Lead the World

The porcelain made by secret formula and of imported ingredients will stand up under the most severe conditions; the metal parts, case-hardened, cannot be bruised; and the electrodes, of special alloy, will withstand the current much longer and carry it far better than the old-style electrodes commonly found in plugs of this price.

The Conical Type Spark Plugs, so called because the cylinder end of the porcelain is conical in form, give excellent results. They have gained wide popularity.

The Petticoat Type, also named from the shape of the cylinder end of the porcelain, affords extra insulating surface around the central electrode. For oily motors, this plug, with the closed end, is the best plug made.

Both Conical and Petticoat types may also be had with platinum points, at 50 cents extra.

Dealers: Jeffery-Dewitt plugs come in many types to suit all motors. Full descriptions will be found in our free literature.

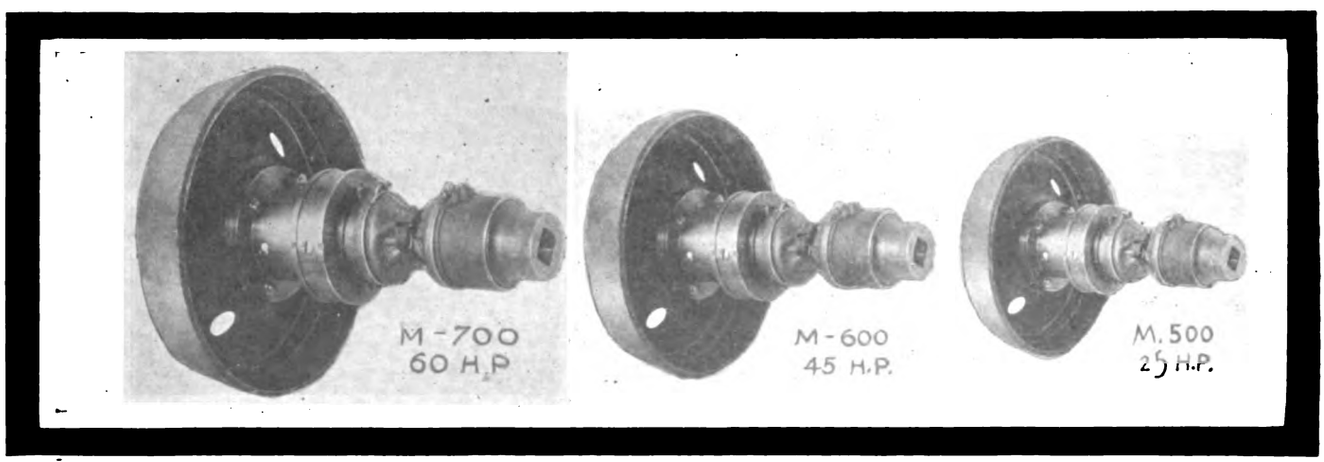
Hartford CONE CLUTCHES

IF any assembly in a truck's make-up needs to be fool proof, it is the clutch.

How near can the ordinary driver guess the weight which he is going to apply power to when starting his truck? There is the weight of his truck, his load and the inertia of both.

He starts the motor, sets the spark and throttle, engages the low gear, but before he lets in the clutch can he do more than guess the power his motor is developing?

The relation of one to the other must be solved by the clutch and it must also eliminate from the equation the human element because it is a variable quantity.



Hartford Cone Clutches arrive at the relation between a motor and its load quicker than any other. Hartford Cone Clutches take hold by gradually increasing their grip or "clutch" on the power until they become at one time a rigid connection between the motor and drive gears.

Their release can be instantaneous in case of emergency or the clutch can be made to slip enough to meet conditions.

Cone type clutches are conceded by engineering experts to be superior to any other type. Hartford Cone Clutches are invariably preferred by truck experts because of their efficiency under the most severe conditions of power, load and driving intelligence.

Many leading pleasure cars are Hartford equipped. Our truck business is growing with astonishing rapidity. There is, probably, no other factory besides our own, so well equipped with special machinery for making cone clutches, or employing as highly skilled mechanics who have worked on cone clutches exclusively for years.

LEWIS QUALITY

THE clean-cut design of this front [illegible] and its inherent strength and efficiency w[illegible] you at first glance.

Note that the steering knuckles are of liberal size, of heat treated 20-30 pt. carbon steel, equal to any strain to which they may be subjected. Knuckle bolts are 1 inch in diameter, case hardened and ground, and are threaded into the lower head of axle yoke and locked with a castellated nut, preventing any possibility of loosening.

Steering arms are forged with bends and heat treated. They are tapered to fit knuckle and are drawn securely into position with a case-hardened castellated nut and cotter.

Observe that the grease cups are in center of spindle and steering arm, giving equal lubrication to bushings of both knuckle bolt and tie rod bolt.

Lewis Quality in an axle means that every **detail** is looked after with scrupulous care. Nothing is left undone that will assure safety, durability and service.

Get "Lewis Quality" details before you close for 1914. Comparison of values will prove interesting.

"American"

Axles of Quality

EXPERT judgment of a motor car discriminates sharply between external features which may be optional with any car, and those fundamental features that are built into it.

We don't think any one will dispute the statement that of those features which are both vital and distinctive, it is the axle that really establishes a car's class.

The satisfactory operation of any car, whether measured in dollars or in security, is based upon axle efficiency. And this is as true of a gasoline car making its own power, as it is of an electric which leaves the garage with a measured amount of latent power in its batteries.

The axle problem is wholly one of power transmission, which depends upon the material used, excellence of design and durability of construction. Judged by any one of these factors, well posted automobile engineers will frankly concede the superiority of "*American*" **Axles.**

The adoption of "*American*" **Axles** is simply a quality proposition. The owner of a car equipped with them has the assurance that nothing equally good can be bought at any price.

"*American*" Axles offer the option of our own perfected bevel drive or the famous Lanchester-Daimler Worm Drive

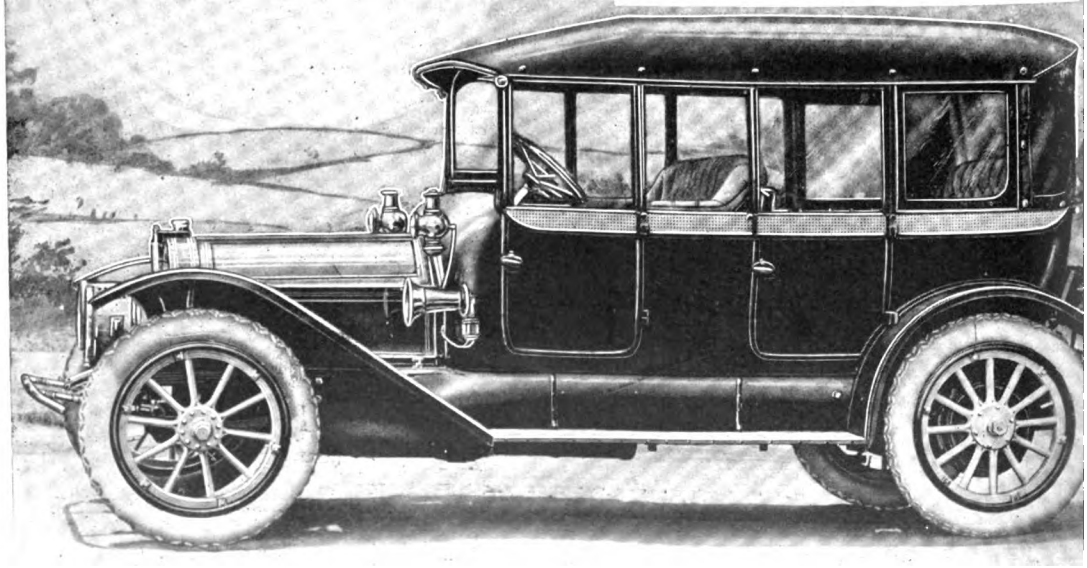
SPRINGFIELD CONVERTIBLE BODIES

With a Springfield Convertible Body, a few minutes work will turn the open touring car into a handsome luxurious closed car.

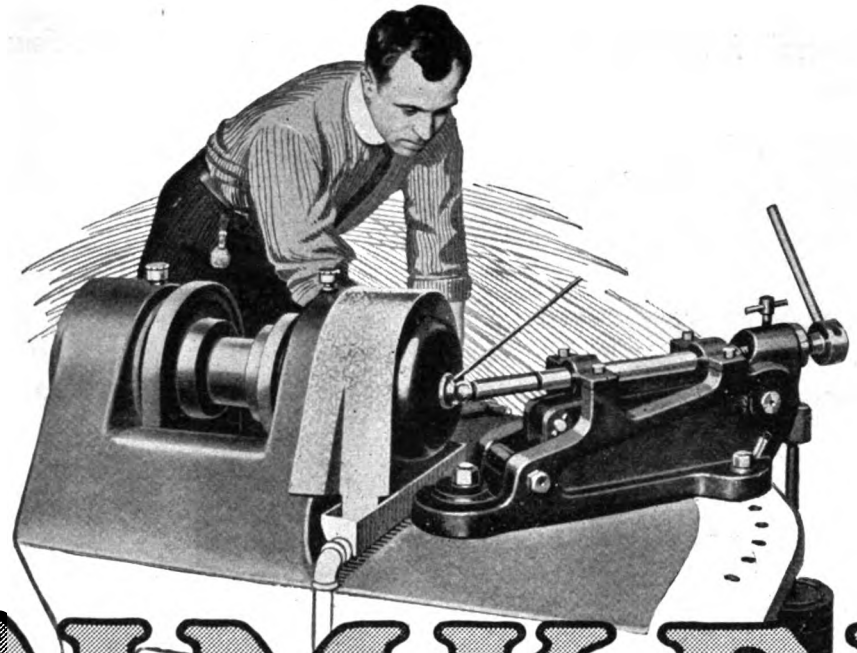
This radical departure from the unsightly, uncomfortable, ordinary top, is the final result of three years' development and it is today the ***only*** practical all-year-round body on the market.

When open, there are no signs calling attention to the fact that the body can be entirely enclosed in glass—just an ordinary closed top is visible.



When in position, the Springfield Convertible Body gives a beautiful glass enclosed, weather proof car with wide doors free from obstructions—in every way equal to the permanently closed car in appearance and comfort.

The transformation can be worked in remarkably short time through the simple operation of raising the top and adjusting the glass windows which are contained in a box back of the front seat when the car is open.



The Convertible Top feature is exclusive on Springfield Metal Bodies. It will not fit any other body, but we are prepared to make prompt deliveries on all designs from the little runabout to the largest limousine or landaulet.

Further information is at your command. Write for it.

TIMKEN
TAPERED ROLLER BEARINGS

The One Place Where Timken Bearings Wear Out

Every Timken Bearing, large or small, is of just one Timken Quality, through and through

THAT place is not in your car! It is in a special test machine that is built to wear out bearings.

Even there we have to put the load of a 5-ton truck on the ordinary pleasure car bearing—we have to run it under this great overload 70 to 80 miles an hour, for days and nights, in order to learn within a reasonable time what a Timken Bearing will stand.

Why do we have this "wear out" test machine?

For three reasons:

1. To find the weakest link in the chain. Each of the 210 different sizes of the Timken Bearing has three fundamental parts—cone, rollers and cup. The bearing is no stronger than its weakest part. The "wear out" machine finds that weakest part in each size bearing. Then the entire Timken organization concentrates on the improvement of that part.

2. Timken engineers have designed each of the 210 sizes for a definite radial load and a definite end-thrust. Are their calculations correct? Do they work out in actual practice? The "wear out" machine tells.

3. The "wear out" machine enables us to compare every other type and make of bearing with the Timken. That's important because we have sworn that the Timken shall always lead in the quality of its performance.

Years ago the Timken Tapered Roller Bearing proved its superiority for the severe service of the motor car. Because its unique principles of design were right!

We have never found a way to improve on those basic principles. But what we have done and are doing every month and year is to make the Timken a better bearing in steels, in heat-treatment, in accuracy.

So that it will be still longer lived and will give an overflowing measure of satisfactory service to the user.

Get the interesting story of the bearing by writing for the Timken Primer No. T-1. Sent free, post-paid.

The Proud Boast of the Automobile Manufacturer

used to be: "We make every part of our car in our own factory." After they had tried it for a year or two they found out, (and *their customers* found out) that, *although a* GOOD *car* MUST *be a unit in* DESIGN, *it* CAN'T *be a unit in* CONSTRUCTION. They found out that in a GOOD *automobile each essential part is a job for a* SPECIALIST—one that only a specialist, concentrating *all* his thought, *all* his experience and *all* his manufacturing facilities ON ONE THING, can rightly handle.

So today the proud boast of some of the proudest manufacturers is, that following the great DESIGN of *their own great engineers*, they are building their car of this good axle, that good wheel, the other good transmission, and so on to the

PROUDEST BOAST OF ALL—

"We Use the 'Sweet-Tempered'"

Model "SS" Buda Little Six

BUDA MOTOR

"the part that sells the car"

Indeed True That nothing speaks more plainly of Buda superiority than the dropping by car manufacturers of their Motor Departments and the adoption of Buda Motors. The tendency of the trade is toward recognition of the fact that the *essential parts* of a motor car or truck should be the work of *Specialists*, not *Departments*.

About the best selling instructions the Manufacturer can give his salesmen or suggest to his dealers begin with: "Flip open the hood and play your strongest card first — The *Buda Motor.*"

The car buyer has come to know all this—and WHEN . THE . CONSUMER . KNOWS . WHAT . HE . WANTS— "arguments are not in order." His educated preference is a mighty force in your favor and, to have him on your side you must give him *what he wants.* (*We* teach him *why.*)

INTERLOCKS

Stop Your Tire Trouble

Don't fail to write today for Interlock Booklet which tells all about Interlock Inner Tires, and gives many new tire pointers of the greatest value to every automobile owner.

The Interlock is an **extra inside tire** which is placed between the outer casing and the inner tube for the purpose of so strengthening the tire that it will be proof against blow-outs, rim cuts and punctures and therefore last twice as long.

When you know what Interlocks will do, you will want them. They give you practically **two tires on each wheel** with no change in the looks of the tire. With this combined strength you can run your car an entire season without delays, annoyance or tire trouble, and save about half your tire expense.

In writing for catalog, please give name of your local dealer, and if he cannot supply you with Interlocks, we will send you the name of a nearby dealer who can.

To Dealers: A good proof of the efficiency of Interlocks is that they are regularly stocked in all sizes by the largest jobbers who only handle quality goods, such as Beckley-Ralston Co., Chicago; Bi-Motor Equipment Co., and Iver Johnson, Boston; Fry & McGill Co., Denver; Motor & Machinist Co., Kansas City; Chanslor & Lyons, Los Angeles; Western Auto Specialty Co., Iowa City; Ia.; Gibson Automobile Co., Indianapolis and all leading automobile supply houses.

Biggest Demand for "SOOT PROOF" Spark Plugs

More than half the motorists you meet know the merits of Mezger "Soot Proof" plugs.

Millions of car owners have adopted "Soot Proof" plugs because they know they deliver the hottest sparks, never grow feeble, balk or leak and are self-cleaning. This you can guarantee.

There is a better business in "Soot Proof" plugs than in any other because of the growing demand for a trouble proof plug. This demand is the result of the experience of millions of motorists with spark plugs for the last twelve years.

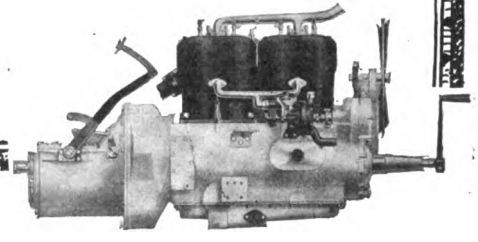
Prompt Deliveries

We can make prompt deliveries of any Ergon standard motors.

Model C, 3¾ x 4½
Model CX, 4 x 4½
Model D, 4⅜ x 6

Ergon motors are four cyilnder, four cycle, L head, unit plant type.

Standard sub-frame motors for use with separate clutch and transmission can be supplied in regular sizes.



In Model D, 4⅜ x 6, Renold Silent Chain replaces timing gears.

The Ergon cam shaft is a one-piece forging and is provided with large bearings. A thrust collar effectually prevents any endwise movement. The spiral gears are sand blasted and ground after hardening to insure perfect running.

We solicit correspondence regarding Ergon Motors and deliveries.

SPLITDORF

"Always There"

Circumstances alter cases—

but let no circumstance alter YOUR SOUND JUDGMENT in the constant use of SPLITDORF COMMON SENSE PLUG.

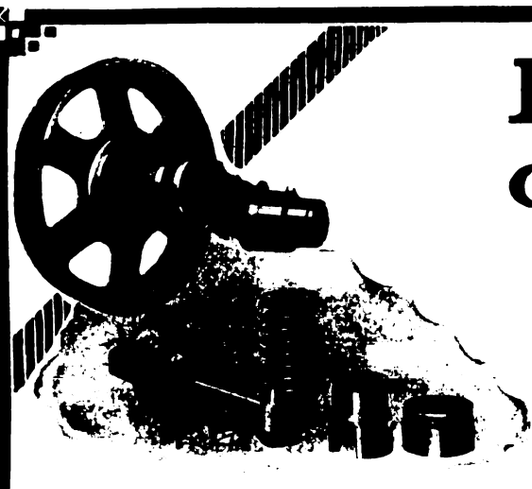
The insulation of SPLITDORF PLUGS is high quality mica and designed and manufactured to absolutely withstand the breaking down effects of high-tension current.

The design of the SPLITDORF central electrode is proof against all expansion and contraction.

The construction of the SPLITDORF shell allows small space for gas and its shape prevents all trouble due to pre-ignition on account of red-hot metal parts.

The SPLITDORF PLUG is less liable to short-circuit from carbon deposits than any other form of plug ever put out by any manufacturer.

STUDY SPLITDORF ADVANTAGES—TRY SPLITDORF PLUGS—then we know that whatever may be the circumstances SPLITDORF PLUGS will come first, last and all the time.



Remember, All! "New ignition for old" is our slogan--We have a SPECIAL EXCHANGE proposition of the greatest interest to every owner of a gasoline motor who would save time and money. Write or call TODAY for particulars.

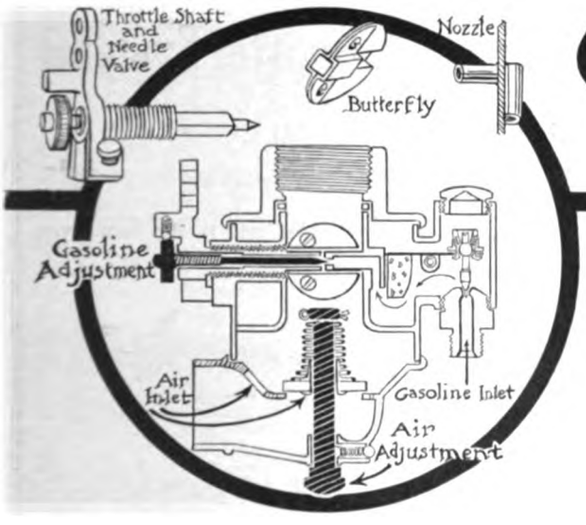
"Whitney" Chains

The Most Practical for Motor Trucks



Because the "Whitney" Cotter Detachable Chain can be easily separated at any link and lengthened, shortened, or repaired without the use of any special tool. This is of great advantage to truck builders, owners and drivers.

"Whitney" Chains are used by the leaders because they are strong, accurate, dependable and, above all, long lived. They are made right and they're made from the right kind of material, thus giving highest efficiency. When making replacements insist on a "Whitney" Detachable.

"Whitney" Chains are Built for Strains

The Whitney Mfg. Co.
HARTFORD, CONN.

Gasoline and Air

Eiker Carbureter has but one adjustment for each

It commands your attention because it has one-third less mechanism than other carbureters.

It has features which are obviously superior. The spray nozzle is located in the middle of the throttle disc—right at the point of greatest suction. When the throttle is opened the supply of gasoline is automatically increased as needed. This avoids the necessity of multiple jets and numerous complicated adjustments.

EIKER construction insures utmost economy in consumption.

1914 models and new series models of many well known cars will be equipped with the EIKER CARBURETER. Car designers realize its superiority.

We have a special proposition for the live sort of dealers. Send today for prices.

When your

DAYTON AIRLESS

tire strikes a stone—

the stone sinks into the tire, rubber is displaced, the "pier" (A) squeezes down and bulges out into the open spaces between (B). Naturally it follows that the tire passes over the stone with a very slight vibration or "bounce." With an air filled tire you are bound to get greater bounce—there is no outlet for the air and it therefore shoots away from the obstruction point and back again with a rush, throwing you into the air. Dayton Airless tires provide for the comfort—the ease that you must have.

But much more; "airless" means complete freedom from tire trouble, punctures, blowouts, etc., and the long train of worry, danger, delays, annoyance, expense.

"Air-free, carefree," and wear-free besides: they last longer than any other kind. We guarantee Dayton Airless for 5000 to 8000 miles; according to the weight of your car.

Ask us to prove these facts to you. Send for our Catechism; shows you that tire economy is not always in the first cost; shows you a newer kind of automobiling pleasure.

To Agents: Write us about territory for this practical, sure-selling line of tires.

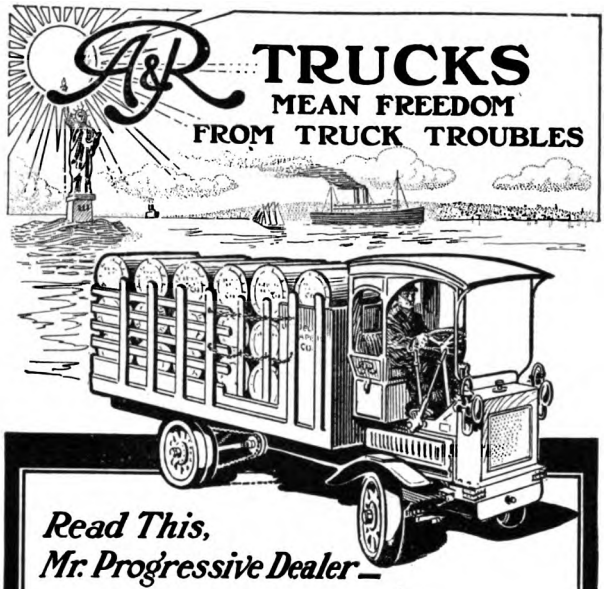
Buyers of electrics are asking for a forward-drive, wheel-steer car with a simple and positive foot-control

The LUXURIOUS BROC

with forward-drive, wheel-steer and *new foot-control* will *completely satisfy them.*

Because the new foot-control on Broc forward-drive, wheel-steer cars permits *free* use of *both* hands. It is manipulated from neutral position (power off) by *merely tilting the pedal.* When the desired speed is obtained, *no pressure is needed to retain it. In fact the foot may be removed entirely from the pedal.* The Broc foot-control is simple and positive of operation.



To return to neutral position (power off), the pedal is tilted in the opposite direction. Additional pressure applies the shaft-brake. Rear-wheel locking-brakes also are furnished.

Your customers will soon be asking you about this new foot-control. To know just what it is and what it will do, mail us a postal-card today.

If you sell high-grade gas-cars. The Luxurious Broc Electric should interest you. Many owners of high-grade gas-cars are adding electrics to their fleets. The Broc is considered a companion-car to the highest-grade gas-cars. And every gas-car owner is a good prospect for the Broc Agent.

The BROC ELECTRIC VEHICLE COMPANY

Read This, Mr. Progressive Dealer—

You will be interested in our Special Proposition to Dealers covering the representation and sale of A. & R. Motor Trucks throughout the U. S.

You will be interested whether--

1. You want to add a line of motor trucks to your present line of pleasure cars—or if—
2. You want to substitute an easier-selling, quicker profit-producing line of motor trucks for the line you now represent—or if—
3. You are considering entering the motor truck field under any other conditions, you will find that an A. & R. Agency is the most congenial and profitable connection you can possibly make.

In any event don't sign up with any manufacturer until you have investigated our Special Sales Plan which includes—

A. The allotting of selling territory.

B. Offers you a special price on your demonstrating truck.

C. And thoroughly covers a time limited, added profit offer to Dealers.

You will do well to investigate this proposition to Dealers **immediately** as we will withdraw our offer Sept. 20th, 1913. Wire or write today for full particulars.

Get Weed Tire Chains at Once!

"I know you are a careful driver, but it is best to adopt every device to *prevent* accidents.

"I can't afford to take *any chances.* We have all foolishly depended on rubber alone long enough. It's time to awake to our responsibility. So go at once and buy a complete equipment of *Weed Chains* and never start out without them when the roads or pavements are slippery or greasy."

Weed Anti-Skid Chains

Insure Against Anxious Moments

Probably no other device has done so much to raise the factor of automobile safety as WEED CHAINS. They are the proverbial "ounce of prevention" against skidding, the cause of over ninety per cent of all automobile accidents—*Life Insurance* and *Accident Insurance Companies* strongly endorse them and recommend their use. *Taxicab Companies,* for their own protection, *insist* that their drivers put them on when the streets are wet or slippery.

Increasing Demand

for WEED CHAINS makes them the *most profitable* Automobile Accessory handled by Dealers—Quick and Steady Sales—No Dull Seasons—No Dead Stock—Easily Handled—Liberal Profits—Universal Satisfaction.

Attractive, convincing, decorative, lithographed hangers supplied to dealers upon request.

Business Promotion Through Trade Press Efficiency

is to be the keynote of the most notable gathering of technical, class and trade journal editors and publishers ever held in America. No live manufacturer, sales manager, advertising man, trade paper editor or publisher can afford to overlook the

Eight Annual Convention of the Federation of Trade Press Associations in the United States at the Hotel Astor, New York, Sept. 18, 19, 20, 1913

Two sessions will be held daily. There will be editorial, circulation, advertising and publishing symposiums under competent leaders. Many of the leading editors, business managers, buyers and sellers of advertising, and authorities on modern merchandising methods will take part. On Friday afternoon, September 19, there will be a mass meeting with addresses by representative business and professional men, on subjects of timely interest to editors, publishers and advertisers. Distinguished guests and worth-while speakers will be at the annual banquet, which will be made a memorable social occasion. No matter what may be your connection with the trade journal field, if you are interested in the idea of business promotion through trade press efficiency, if you believe in business papers for business men, you will be welcome at all sessions.

TRIPLEX

A FUEL SAVER and A MONEY SAVER

Increases Power Decreases Cost

The Triplex is a device placed between the manifold and the carburetor to break up the mixture. No matter how imperfectly the carburetor does its work, the Triplex equalizes the mixture, producing an explosive gas of even, uniform quality that will burn clean to the last atom. This means that the user gets all the power all the time—that every fraction of energy to be obtained from the gasoline is produced and used. There is absolutely no waste. High proof gasoline is made out of low, and over 25% is saved on every gallon. For further information write us.

IDEAL STEEL WHEEL (RESILIENT)
STRENGTH COMFORT BEAUTY ECONOMY
IT'S IN THE SPOKES

ANNOUNCEMENT TO DEALERS

We have hundreds of inquiries from automobile owners who want to buy our wheels because they solve the tire problem and double the life of all tires, at the same time making the car ride with luxurious ease. These inquiries are from all sections of the country. With our present distribution we are unable to handle them to advantage.

If you are in a position to handle our wheels and to give demonstrations of them we can offer you a liberal selling contract with exclusive territory and no competition. Ours is a free-trial, money back proposition to the consumer. For the dealer it means quick turns of the small amount of money invested and unusually attractive profits.

Write immediately and get the advantage of our extensive summer advertising.

"Our Shaler Has Not Only Paid for Itself But Has Paid The Wages of an Extra Man and the Rent of our Building as Well."

WHAT the **Shaler** has done for this man, it will do for you. We sold him a style B and the above is a quotation from the letter he wrote us a short time later. He is a practical business man or he wouldn't be running a garage. His experience may be worth something to you.

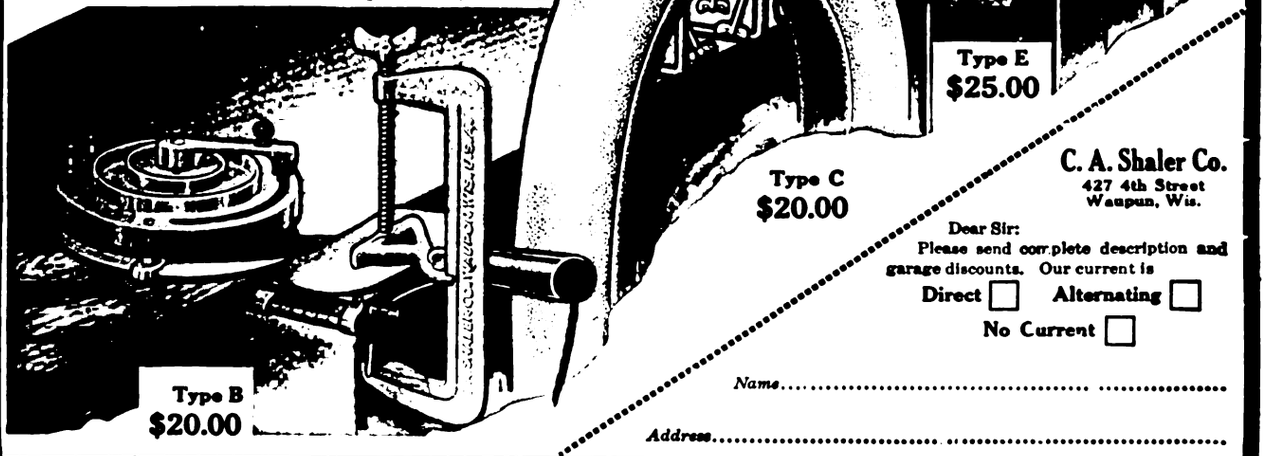
SHALER Vulcanizers

Electric or Alcohol Heated

Can just as well be paying your garage rent

In the first place, they will do any kind of tire repair work. Second, they **cost less than two cents an hour to operate** and are so simple and reliable that any boy who can wash a car can make more money for you with one than could a first-class mechanic with a full equipment of tools.

When you stop to think that the material and current for a fifty cent repair cost you only two or three cents, it's mighty plain that the **Shaler** is a paying proposition. **Why, a couple of dozen repairs will pay for the vulcanizer,** and after that every repair means from fifty cents to three or four dollars added to your bank account.



The season is just opening, bigger than ever. More tires are going to be punctured and torn than ever before. Somebody will have to repair them.

Do you want the profits on this work?

Send for Free Hand Book
And Confidential Dealer's Discount

Tells all about the Shaler and its money making possibilities—how you can add from $10.00 to $20.00 to your daily profits.

Connecticut Requires Powerful Warning Signal

A NEW warning signal law went into effect in the State of Connecticut on July 1, 1913: "Every motor vehicle so operated shall be provided with a suitable bell, horn, or other signaling device, which shall produce an abrupt sound sufficiently loud to serve as an adequate warning of danger, but no person operating any motor vehicle shall make or cause to be made any unnecessary noise with such bell, horn or signaling device, or use the same except as a warning of danger." . . . The note of the bulb-horn is not "sufficiently loud to serve as an adequate warning of danger." It can be heard only for a short distance under the best conditions. In city traffic, on curving country roads, in windy or rainy weather, it is seldom heard. It is useless in an emergency—it is not only awkward to operate but often fails entirely when submitted to sudden pressure.

SIMILAR measures directed against the bulb horn are in operation in several other states, and in 26 of the largest cities in the country.

THE KLAXON is used by 200,000 motorists. Carried on nine out of ten high-grade cars. Regular factory equipment on 57 different makes of automobiles.

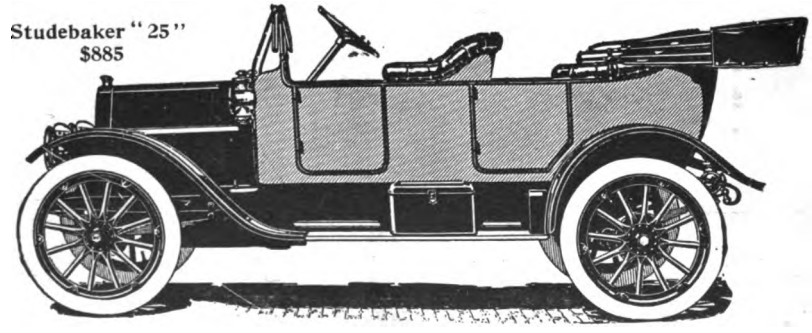
Studebaker

Sustained Merit Alone Can Hold Public Confidence



THE success of any car depends upon its standing with the general public—whether they have confidence in the car and confidence in the maker.

On this basis - there is no mystery in the almost universal demand for Studebaker cars.

The Studebaker reputation has been built on public confidence—adhering steadfastly to but one line of relationship with the public - to give them only the best always—to make Merit the only consideration in production.

And because Studebaker has always stood for this Ideal—the Studebaker car has become known as Everyman's car—as the universal car.

Progressive dealers have been quick to realize the great value to them of this public confidence in Studebaker cars—they have found that selling the Studebaker car is largely only a question of being able to meet the demand.

New Automatic Truffault-Hartford has Established New Ideal in Motoring Comfort

All that the original Truffault-Hartford Shock Absorber has meant to the two hundred thousand owners whose cars are equipped with this devise—in increased comfort, greater tire mileage and greater car efficiency—is realized to even fuller extent by the New Automatic Truffault-Hartford Shock Absorber.

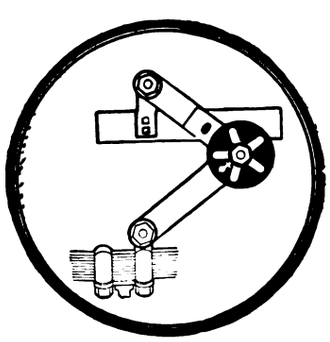
This latest Truffault-Hartford model gives absolute immunity from jolt, jar and vibration for any car with any kind of spring, over any sort of road.

This greater efficiency results from the three tension principle upon which the New Automatic is built. There are three separate and distinct degrees of frictional tension in this new shock absorber, each coming into play as the condition calling for its use arises.

The first tension, while very slight, is sufficient to absorb the small spring oscillations on smooth roads and produces an effect equivalent to riding in a Pullman coach over a rock-ballasted railway.

The second tension offers frictional resistance calculated to meet the change of road conditions from a boulevard roadbed to one of moderate roughness.

The third tension exercises the proper restraint necessary on exceptionally rough roads and completely absorbs the car-racking, tire-killing jolt otherwise inevitable.



These tensions are all positively automatic in action. They respond immediately to a change in the condition of the road.

The nature of the car's spring equipment does not effect the New Automatic's efficiency. Both stiff and highly flexible springs benefit.

Like the famous

[illegible]

"The Pioneer Shock Absorber"

—the New Automatic does not detract from the car's appearance. The additional comfort it imparts wins the enthusiastic approval of your lady passengers. $60 per set of four.

Write for new catalog giving complete information of this and other models.

Ball Bearings count less in the cost and more in the durability of a car than anything else in its equipment. Quality and service always win in this essential feature of an automobile.

The merit of R. I. V. Ball Bearings is well indicated by the fact that they are now used by the manufacturers, dealers and motorists who have had the most experience.

These famous Ball Bearings are the "Hall Mark" of a good car and dealers are proud to call attention to them.

FEDDERS RADIATORS

THE value of copper in the manufacturing of the cooling sections of radiators is unquestioned. Not only is copper an exceedingly soft, pliable metal with high heat conductivity but it is tough and strong. In addition to this copper also has the advantage of being nonporous, which is a safeguard against the development of leaks after the radiator has been in use for any length of time.

Fedders radiator cores are made of the purest copper obtainable and therefore present a degree of efficiency and durability that is unexcelled. Irrespective of what your radiator requirements may be we are in position to take care of your business in satisfactory manner. Our corps of experts is at your command. Send us your blue prints and we will submit prices.

Overland

Making money for the dealer

THE business of selling automobiles has settled down to be a business. Each succeeding year brings out new and more competition. The modern automobile is as staple as steel. In 1914 dealers will find themselves face to face with competition as keen and as active as in any other staple line of business—such as hats, shoes, clothing, machinery, etc., etc.

They must therefore, by necessity, adjust themselves, their business, their way of conducting their business, and their organization accordingly. They must, above all other things concentrate and intensify their selling activities in every populated section of their territory.

The Willys-Overland Company have, from year to year, made it possible, practical and profitable for its dealers to successfully do business on this basis. The selling price and cash value of each new model has been placed far beyond competition. Each year we have been in advance, particularly from a selling standpoint, of any car made.

We give our dealers more practical co-operation, more advertising, more assistance from factory representatives, and a more saleable article than any other manufacturer in the business.

The dealer who handles the 1914 Overland will have the most rapid selling, non-competitive, and profitable car made.

Wait for our 1914 announcement; August 16th.

The Willys-Overland Company
Toledo, Ohio

MOTOR WORLD

Vol. XXXVI New York, U. S. A., Thursday, July 17, 1913 No. 4

BRISCOE HERE FOR BRIEF VISIT; CAR NEARLY READY

His Plans Somewhat Altered and Others May Build Car in America —Will Be Made in Europe— Some of Its Features.

For the first time since he sailed to Europe in November last, Benjamin Briscoe, former head of the United States Motor Co., is again in this country. Unheralded, he arrived in New York late last week, and since that time has visited several points, some of which were the scenes of former Maxwell-Briscoe activities. At last reports, he was in Providence, but he has not permitted a searchlight to follow his movements. He will return to Paris on Saturday, 26th inst.

While the fact has been published several times that Briscoe has organized the Briscoe Bros. Co., under French laws, and at a plant in Billancourt, near Paris, has been developing a light car for the American market, it was generally believed that it was his immediate intention to form an American company for its actual manufacture. It transpires, however, that this is by no means assured; instead, it is not improbable that the actual production of the Briscoe car in America will be turned over to others.

Although it was not understood to be included in his plans, it is fairly well settled that the Briscoe Bros. Co. will make an active bid for European trade in 1914, and that the car will first be publicly exhibited at the forthcoming Paris show in October. Several of them already are on the roads around Paris and, according to reports, are giving an uncommonly good account of themselves.

In its design, the Briscoe car does not depart radically from standard practice. It embodies all of the latest ideas of the French school, but has been laid out with a view of economical production on an American quantity basis. It is fitted with a unit power plant having a four-cylinder, long-stroke block motor which, on bench tests, is said to develop 33 horsepower at 1600 revolutions. The motor is an L casting with enclosed valves, integral intake manifold and independent exhaust manifold. Its gearing provides three speeds ahead and reverse. The rear axle is of the full-floating type and long, broad, thin-leaved semi-elliptical springs front and rear constitute the suspension. The bonnet merges gracefully into the scuttle dash, carrying the gasolene tank, the fore and aft line of the car being unbroken. The new car, like most European productions, will be equipped with wire wheels.

Both open and closed cars will be manufactured, and in all probability the price of a full touring model will be less than $1,000, in accordance with Briscoe's original plans.

Square Horn Removes to New Jersey.

Having acquired an interest in the Square Motor Horn Co., of New York, Joel Weiner, of the Weiner-Barnett saddlery company, of Newark, N. J., has assumed the presidency, succeednig Sol Salvini, the inventor of the horn, who, however, retains identification with it. Following the entry of Weiner into Square Horn affairs, the plant has been removed from New York City to 312-322 Adams street, Newark, where two of the buildings comprising the Weiner-Barnett plant will be given over to the manufacture of the horn, which will be conducted on a much larger scale. Salvini, of course, has retired from the presidency, but Charles May remains vice-president and general manager.

Maxwell Prices May Be Increased.

Maxwell prices are to be advanced for 1914, according to a published announcement of the Maxwell dealers in New York City. The Maxwell headquarters in Detroit, however, will not discuss the subject, being content with the statement that prices have not yet been fixed and will not be settled for a week or more.

LACK OF CAPITAL HAMPERS WEBB; RECEIVER IN CHARGE

Full of Orders, but no Cash to Build the Fire Apparatus—Receivership Follows Creditors' Conference and Advice.

With orders in hand for automobile fire engines to the value of $373,223, but lacking the cash to build them, the Webb Co., of Allentown, Pa., last week placed itself in the hands of its creditors and, after an extended conference, they decided that a receivership was the best way out of the difficulty. Accordingly, Robert E. Wilbur, who at one time was connected with the Lehigh Car & Axle Works, was recommended for the post of receiver, the necessary application being filed on Thursday, 10th inst. A committee of five creditors will also be appointed to act as an advisory committee, as it is believed that with expert assistance it is easily possible to replace the Webb Co. on its feet.

Its assets, as rendered to the creditors, total $557,844.36, and the liabilities figure out to the same amount, as follows:

Assets.

Cash	$276.68
Bills receivable	
Accounts receivable	83,519.90
Consignment	8,508.75
Inventory	140,000.00
Plant and property	294,290.37
Deposits on purchases	18,079.16
Deposits on sales	13,169.50
	$557,844.36

Liabilities.

Bills payable	$179,204.18
Open accounts	50,949.07
Mortgage	155,000.00
Net worth	172,691.11.
	$557,844.36

Bills payable for merchandise total $45,-271 and open accounts payable $50,949. Most of the remainder are bank loans due banks in Allentown and South Bethlehem, Jersey City, Baltimore and St. Louis.

Digitized by Google

At the creditors' meeting, John M. Mack, treasurer of the company, stated that $120,000 would be required to complete the contracts in hand, and that $30,000 promptly furnished might meet immediate needs. The creditors, however, decided that a receiver in equity was the best way out of the trouble.

Reports that the Webb Co. was seriously suffering from lack of capital have been afloat for several weeks, and for that reason the receivership is not wholly a surprise. According to these reports, John M. Mack's brother, who is interested to some extent in the Webb enterprise, had become so heavily involved by the endorsement of paper for a silk concern in which he also is interested, that his health has been almost hopelessly shattered.

Originally, the Webb Co. itself was the Webb Motor Fire Apparatus Co., of St. Louis. John M. Mack, and some of his associates in the Mack Bros. Motor Co., acquired an interest in its early last fall, after Mack had retired from the International Motor Co., to which the Mack property had been sold. The Webb plant was removed to Allentown and the present corporation formed under Delaware laws with a capitalization of $1,500,000, of which $600,000 was represented by preferred stock.

A. C. Webb, president of the original company, remained the head of the new one, the general management, however, being in the hands of Roland Carr, a new man in the automobile industry.

Blames Branch Houses for Failure.

The Grand Rapids (Mich.) Motor Truck Co., which, as exclusively stated in Motor World, failed on June 7th, at a time when it was endeavoring to effect a merger with the Michigan Hearse Co., of that city, has been formally adjudicated a bankrupt. The Grand Rapids Trust Co. has been appointed receiver, Kirk E. Wicks being the referee.

The company was removed from Decatur, Ind., about a year ago, but failed to prosper. Its officials attribute the failure to the establishment of several branch houses, all of which not only proved unprofitable but caused a heavy drain on the company's resources. The company was capitalized at $500,000. Its liabilities and assets are estimated at about $125,000.

Second Dividend for Flanders's Creditors.

As as result of the recent sale of the stock on hand, the receiver of the Flanders Mfg. Co., of Pontiac, Mich., has declared a dividend of 15 per cent., which will be shared by about 900 creditors. This payment will make 40 per cent. which the creditors have received, the first dividend of 25 per cent. having been disbursed some three months ago.

DELCO TAKES NORTH-EAST ELECTRIC SYSTEM TO COURT

Makes New York Dealer Nominal Defendant in Action Charging Infringement—Two Patents Involved in the Proceedings.

Laying the foundation of what promises to be a long drawn out legal battle in which the status of electric lighting and engine starting apparatus in the patent office is likely to be well thrashed out, the Dayton Electrical Laboratories Co., and Conrad Hubert, of Dayton, O., this week instituted equity proceedings in the United States Court for the Southern District of New York nominally against a New York dealer but really against the North East Electric Co., of Rochester, N. Y., for alleged infringement of the patents covering the Delco lighting and starting system.

Two patents are involved and both were issued to Clyde J. Coleman, who later assigned them to Hubert, who in turn granted the Delco company exclusive rights to manufacture and sell the apparatus covered by them. The patents under fire are No. 745,157, issued Nov. 24, 1903, and No 842,827, issued Jan. 29,1907.

The Sidney B. Bowman Automobile Co of New York City, is the nominal defendant in the case. Bowman handles Marmon cars and, according to the complaint, sold a four-cylinder Marmon on March 24, 1913, that was equipped with the North East electric lighting and engine starting equipment, which action, it is alleged, constitutes infringement of the Delco company's patents. Wherefore the Dayton Electrical Laboratories Co. prays for the usual temporary and permanent injunctions to restrain the Bowman company from further infringement.

Milwaukee Motor's Debts Run High.

Schedules in bankruptcy filed by the Milwaukee Motor Co., of Milwaukee, Wis., which was petitioned into bankruptcy some four weeks since, show liabilities of $340,459 and assets of $325,541. The liabilities are made up of wages $12,119, secured claims $15,600, unsecured claims $217,740 and "notes and bills which ought to to be paid by other parties" $59,000. The assets are made up of real estate $60,553, stock in trade $60,000, machinery, tools, etc., $166,569, open accounts $32,387 and minor items, including cash on hand, approximating $6,000.

Three Milwaukee banks, whose claims total $63,000, are the heaviest creditors. The other large creditors are: Racine Brass & Iron Co., $30,500; E. E. Warner, Wauwatosa, Wis., $17,500; E. G. Miller, Milwaukee, $12,800; Standard Foundry Co., Racine, $10,600; North-East Electric Co., Rochester, N. Y., $7,300.

Used Car Deal that "Kicked Back."

The man who undertakes to sell a used car at a specified price and within a specified period has something to learn, as Jas. J. Kearns, of Bridgeport, Conn., discovered last week in the common pleas court in that city. His assurance as to what he could do with a used car traded in by John D. Slady cost him $694.52. According to the evidence, Slady, on May 18, 1911, agreed to buy a Halladay runabout for $1,700. Kearns, in order to make the sale, agreed to dispose of Slady's Overland for $900 before June 1st. It was not, however, until September that he sold the old car, and then he obtained but $500 for it. Later, Kearns entered suit for $1,000, but the court gave him only $694.52.

Mitchell-Lewis Floats New Note Issue.

Having retired $750,000 of its $2,500,000 note issue, the Mitchell-Lewis Motor Co., of Racine, Wis., will take care of the remainder, maturing August 1st, by a new issue of one-year notes to the value of $1,500,000 and by a cash payment of $250,000. As was the case with the original issue, the new notes will be underwritten by the banking house of White, Weld & Co. and Geo. H. Burr & Co., of Chicago and New York, both of whom are directly represented on the Mitchell-Lewis board.

Studebaker Quits Indianapolis Retailing.

While maintaining the wholesale business controlled by its Indianapolis branch, the Studebaker Corporation has turned over its retail interests in that city and the rest of Marion county to the Brown-Rowan-Buck Auto Sales Co., which, capitalized at $40,000, was organized for the purpose. Previously, Brown, Rowan and Buck were identified with the Studebaker establishment in Detroit. Buck will be president of the new company, Rowan secretary-treasurer and Brown general manager.

Mais Redesigning Duplex Power Truck.

A. F. Mais, who designed the truck of that name and who only recently completed the development of the Studebaker commercial vehicles, is now engaged in re-designing and reconstructing the Duplex trucks, made by the Duplex Power Truck Co., of Charlotte, Mich. The latter was tied up by litigation for several years, but since it has been freed from the entanglements it is preparing to go ahead with actual manufacture. Mais's work, which already is well advanced, is one of the first steps in that direction.

"COLLAPSED WHEEL" CASE CARRIED TO HIGHEST COURT

Cadillac Asks Supreme Tribunal to Over-rule Judge Ray's Order for Retrial—Would Curtail Long Drawn Out Litigation.

In an effort to prevent the retrial of the now famous "collapsed wheel case," in which E. Wells Johnson, of Amsterdam, N. Y., was given judgment of $10,000 against the Cadillac Motor Car Co., the latter has asked the Supreme Court of the United States to pass on the matter.

The case was brought to the highest tribunal in the effort to compel Judge Ray, of the United States District Court, to vacate his order for a new trial. The Supreme Court, however, has not yet indicated whether or no it will review the case.

As stated in Motor World of May 22nd last, the suit has taken its place in automobile history as one of the hardest fought litigations on record. It grows out of an accident to Johnson in July, 1909, at which time his right front wheel collapsed and threw him out of his car, grievous injuries resulting. He sued for $40,000 damages and at the hands of a jury in Judge Ray's court was given a verdict of $10,000.

Later Judge Ray directed that this verdict be set aside and the case retried, and it is this ruling on the part of Judge Ray which the Cadillac interests are seeking to overcome. They applied to the United States Circuit Court of Appeals in New York City for an order to set aside Judge Ray's ruling, but that court refused to do so, and unless the Supreme Court elects to pass judgment the whole case must be retired.

It is not wholly because the Cadillac company objects to a retrial that it is following this course of procedure, but because it is anxious to carry the jury's verdict to a higher court in order to have the merits of the case passed on, and it cannot do so unless Judge Ray's order for a new trial is set aside. In other words, the Cadillac company is endeavoring to save time by making a short cut through the courts, for whichever way the retrial may result, an appeal is certain, and as the evidence given in the original suit must be repeated, a rehearing will serve only to further delay laying the merits of the case before a higher court. To date, it is stated that the cost of the litigation amounts to fully $15,000.

Day Now Heads New York Dealers.

Because of the resignation of Harry M. Bronner, who has retired from the automobile trade to resume the sale of champagne in which he previously was engaged, Arthur M. Day, of the A. Elliott Ranney Co., has been elected president of the Automobile Dealers' Association, of New York. To fill the vacancy caused by the elevation of Day to the higher office, C. H. Larson, of the Cutting-Larson Co., has been made vice-president, and R. H. Johnston, manager of the White branch, has been elected a director.

To Auction Searchlight Gas Assets.

By order of the court, the assets of the bankrupt Searchlight Gas Tank Co. will be sold by the receiver, Horace B. Pearson, at auction in Warren, Ohio, August 14th next. The property includes real estate, or leaseholds, and buildings in Warren and Canton, Ohio, Chicago, Ill., Minneapolis, Minn., and Bexar county, Tex. In addition to plants, equipments and fixtures, there will be sold gas tanks, etc., valued at approximately $194,000, which are contained in Searchlight depots in various parts of the country; included in the listed assets are one automobile and 11 trucks, also accounts receivable to the value of $132,000.

Flanders's Purchasers Find a Customer.

Don McCord, one-time general manager of the Flanders Mfg. Co., has become Detroit manager of the Harris Bros. Co., of Chicago, which recently purchased the stock and machinery in the Flanders plant in Pontiac, Mich. At the time of its purchase, the Chicago company also took an option on the buildings, and are preparing to operate some of them with a view of ultimately selling the property as a "going concern." Although the receiver unavailably sought a purchaser, it was stated that the Harrises already have one in view, the negotiations being near to the point of consummation.

Lozier Now Sells San Francisco Branch.

Indicating the policy of the new management, and following the sale of its New York branch to H. S. Houpt, Inc., the Lozier Motor Co. has sold its San Francisco branch to the Bekin-Speers Motor Co., of Los Angeles, which heretofore held the Lozier agency for Southern California only. The company is composed of Milo Bekin and Frohman Speers, who will give their personal attention to the San Francisco establishment.

Southern Buggy Maker Going into Cars.

John G. Anderson, who owns the Rock Hill Buggy Co., in Rock Hill, S. C., is preparing to go into the manufacture of automobiles. His first step in that direction has been to engage H. F. Shaw, of Cincinnati, who will assume charge of the automobile branch of the business.

CYCLECARS? NOT FOR ME, DECLARES BANKER KILBORN

How Vaporish Story Linking His Name with Them Originated — Defines His Attitude Toward Automobile Promotions.

Because Horace M. Kilborn, vice-president of the big National City Bank, of New York, and some of his associates, once poured considerable money into the Orson car and some other automobile projects, and because Kilborn only recently became interested in the Dunlop Wire Wheel Co. of America, his doorstep has been badly worn by men possessed of automobile inventions, or automobile promotions, which require only those little things—capital and factories—to become million-makers.

Because of the fact, Kilborn's name during the last week or two has been associated with cyclecars, an effort being made to have it appear that he is not unlikely to throw his money and influence into a venture of that sort. On the authority of the gentleman himself, however, it can be stat-that Kilborn has not the remotest idea of doing anything of the kind.

"That cyclecar story is true to this extent," he said, when seen by a Motor World man; "a man called here with a tentative prospectus of a cyclecar company, and if I had permitted him to do so he would have unfolded figures showing the enormous profits that are possible. However, I refused to even see him or to look at his figures. The cyclecar may be a very fine article, but it is not going to separate me from any of my money. I would not go into any automobile project if they presented me with half of the capital stock."

Asked if he had knowledge of a new wire wheel enterprise which is organizing with large capitalization, Kilborn responded in the negative. "And you had better tell anyone who is thinking of anything of that sort to look up the Dunlop wire wheel patents before they go too far," he added.

General Motors Man Killed in Accident.

Howard C. Chandler, supervisor of materials of the General Motors Co., Detroit, was instantly killed in an automobile accident and his wife injured, near Pine Lake, Mich., on Monday afternoon last, 14th inst. Chandler, who was going at high speed, attempted to pass another car, but he made the turn too abruptly and, as a result, his car upset and turned completely over. One of the rods supporting the top pierced his heart and caused instant death. His wife was painfully bruised but will recover. Chandler was 45 years old.

TIRE PROBLEM SOLVED! BY WHOM? WILSON; THAT'S ALL

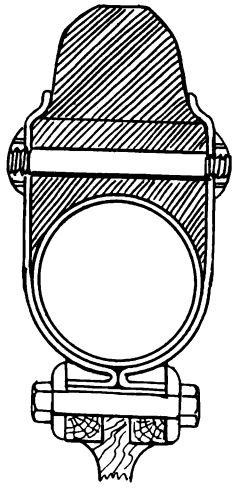
Detroiters so Anxious to Buy His Stock, They Are Turned Away—The Tire and Some High-Art Painting.

They came so fast they had to turn 'em away in Detroit—it resembled "a continuous convention in session every day from 7.30 A. M. until 12 o'clock midnight." You have the word of the Detroit Pneumatic Tire Co. on this point, and as the company was taking their money and giving them Wilson Pneumatic Tire stock in exchange for it, the company ought to know.

"Yes, yes! The women came, too, and they know just about as much about tires as the men do and they also know how to pick out an investment"—this apparently was added as an afterthought.

So far as is made plain, the Detroit Pneumatic Tire Co. has not yet acquired a factory, but it does possess a "fiscal agent," and also has "on exhibition at our store a 40-inch tire which sells for $75 and it costs us only $12 to make it." The par value of the stock is $10 per share and "a great many careful, conservative business men have told" the Wilson people that they are making "a reasonable statement" when they say they "will without doubt pay from 25 to 50 per cent. in dividends the first year" they do business; "as they can sell all the tires they can make at a profit of from 300 to 500 per cent." they apparently have no doubts on that score.

All of these statements and more like them are made in spread-eagle advertisements appearing in the Detroit papers. "Fabulous Profits in Making Automobile Tires" is the big, black, eye-catching headline of one of the advertisements, in which it is declared that "the stories of the immense profits made in the manufacture of automobile tires, especially in Akron, Ohio, where nearly all of the tire companies are located, read like fairy tales; men who were working as laborers a few years ago are more than millionaires."



It goes without saying that the Wilson tire is the "final solution of the tire problem." It is the invention of E. Warren Wilson "some call him 'Gene'; others call him 'E. W.'"—who expended "a lot of patience in search of a cure for tire troubles." Wilson "is a Scotchman and he hunted for his cure just like most of his countrymen search for real Scotch Iverness—and he never quit until he found it."

Of course, the Wilson tire will not puncture, or skid, or blow out, or kick up dust, or injure roads, and it is suitable for any motor vehicle from runabouts to 10-ton trucks, and will last at least 20,000 miles; the Detroit Pneumatic Tire Co. itself says so.

The tire itself, mounted on a demountable rim, also of Wilson design, is shown by the accompanying illustration. It appears to be a combination of the solid and pneumatic tire principle. The rubber tread is 3½ inches thick, the inner tube being confined between a pair of steel rims and this thick rubber tread, all of which makes perfectly plain why the tire cannot puncture or blow out, or cause trouble of any sort.

Only a "limited amount of stock will be offered for sale," and the opportunity is apparently one for young men, for, listen to the lay of the stock-sellers:

"Young man, you who are earning money and carelessly wasting the surplus above your living expenses, this investment will appeal strongly to you if you will come and see what we have and carefully consider what a few dollars now invested will mean to you in a few short years. $100 saved now and invested in this stock will lay the foundation of a comfortable fortune, and the time to do it is to do it now."

WILSON'S TIRE

The officers of the Detroit Pneumatic Tire Co. are: J. W. McCausey, president; E. Warren Wilson, vice-president and general manager; T. S. Sprague, secretary; W. C. Morgan, treasurer.

President McCausey is a wholesale lumber dealer in Detroit and is also president of the Union City (Mich.) National Bank; E. Warren Wilson is the inventor of the tire; T. S. Sprague is the fiscal agent; W. C. Morgan, who was once identified with the Welch Motor Car Co., of Pontiac, apparently is the only automobile man connected with the enterprise. In addition to these gentlemen, the directors are Frank H. Watson and Arthur P. Hicks, both of whom are attorneys, and J. H. Gregg, secretary and treasurer of the Gregg Hardware Co., of Detroit.

The identity of Gregg with the project has served to strengthen it in Detroit but just when or where the actual production of the tire will be undertaken is not made clear.

"Gold Clinking" Plant Again Changes.

At the receiver's sale last week, the property of the Ohio Falls Motor Co., of New Albany, Ind., was bid in by O. E. Smith, treasurer, and A. C. Brock, secretary. They paid $15,000 for it, and also assumed the lease, which latter is valued at about $25,000. There are several liens on the property, including a mortgage of $22,800.

The Ohio Falls company represents the most recent organization of what was originally the American Automobile Co., which conducted an extravagant "clink-of-gold" stock selling campaign which caused the trade to grin and a number of stock-buyers to swear. It failed in due course and was reorganized under a slightly similar name, only to fail again. The Ohio Falls Motor Co. then acquired the assets, and in due time reached the bankruptcy court. The hoodoo which has pursued the concern has not discouraged the latest purchasers, and they propose to reorganize it once more, this time with reduced capitalization.

Paige Increases Equipment but not Price.

Except that the equipment of the Paige "36" has been materially increased, although no increase has been made in the selling price, it will be, for the coming season, substantially the same car that it his been right along; there is even less change in the smaller model—the "25"—which with the "36" forms the line of the Paige-Detroit Motor Car Co., of Detroit, Mich. The equipment that has been added in the case of the "36" includes an electric horn, Jiffy side curtains, combined rain-vision and ventilating windshield and non-skid rear tires; the price, as heretofore, remains $1,275. The price of the "25" also remains stationary at $950; for the first time, however, the smaller car may be had with electric lighting and engine starting equipment—the "36" always has had the Gray & Davis system—in which case the price is $75 higher.

Right or Left Drive on Stearns.

While not discontinuing right hand drive, the F. B. Stearns Co. hereafter will offer the Stearns-Knight cars with option of either right or left drive. The new output also will be marked by a greater variety of bodies, in all of which the straight line effect will be accentuated. The new models likewise will be equipped with electric lights and starter.

The Week's Incorporations

Pontiac, Mich.—Tire Life Mfg. Co., under Michigan laws; authorized capital, $5,000.

Houston, Tex.—Green Taxicab & Automobile Co., under Texas laws; authorized capital, $15,000. Corporators—F. W. Crow, E. M. Weiss, W. W. Kyle.

Philadelphia, Pa.—Bigelow-Willey Motor Co., under Delaware laws; authorized capital, $50,000. Corporators—J. W. Bigelow, C. A. Willey, E. C. Benson.

Detroit, Mich.—Crary Co., under Michigan laws; authorized capital, $10,000; to manufacture gasolene engine supplies. Corporators—L. H. Kirby, C. R. Crary.

Detroit, Mich.—Detroit Automobile Exchange, under Michigan laws; authorized capital, $2,000; to deal in motor cars. Corporators—Farnsworth and S. W. Powell.

Indianapolis, Ind.—Merchants' Garage, under Indiana laws; authorized capital $15,000; to operate a garage, etc. Corporators—B. D. Christian, C. W. Dicks, C. B. Marshall.

Seattle, Wash.—Horton Motor Car Co., under Washington laws; authorized capital, $10,000. Corporators—George M. Horton, Seattle; John T. Braddock, Tacoma, and others.

Cleveland, Ohio—Ohio-Buick Co., under Ohio laws; authorized capital, $200,000. Corporators—Richard H. Lee, W. J. Patterson, C. R. Collar, G. M. Gallagher, E. M. Holmgren.

Buffalo, N. Y.—Buffalo Auto Accessory Mfg. Co., under New York laws; authorized capital, $20,000. Corporators—J. B. Cready, John T. Miller, E. S. McCready, all of Buffalo.

Washington, Ind.—City Automobile Co., under Indiana laws; authorized capital, $3,000; to buy and sell motor cars. Corporators—G. H. Drummond, L. G. Helphenstine, L. A. Knnedy.

Superior, Wis.—Carlson Bros. Co., under Wisconsin laws; authorized capital, $30,000; to deal in motor cars, bicycles, repair work, etc. Corporators—Arthur Carlson, George A. Carlson, Ture Carlson, T. C. Stene.

Philadelphia, Pa.—Mecca Automobile Society, under Delaware laws; authorized capital, $100,000; to conduct a general motor vehicle business. Corporators—C. E. Estler, F. Estler, A. Olson, all of Boston.

Cadiz, Ky.—Cadiz Auto Co., under Kentucky laws; to conduct a general motor vehicle and garage business. Corporators—John S. Crenshaw, W. H. Hammond, G. P. Yhomas, O. H. Malone, V. B. Alexander.

New Albany, Ind.—Falls City Motor Co., under Indiana laws; authorized capital, $50,000; to manufacture and sell motor cars. Corporators—Ferdinand Kahler, Sr., Orland E. South, Archie C. Brock, George R. Elder.

New York, N. Y.—Taxomobile Co., under New York laws; authorized capital, $1,000. Corporators — Abraham Snydecker, 611 West 127th street; Anthony G. Ibbeken and Louisa F. Ibbebken, both of 27 West 124th street.

Chicago, Ill.—C. & R. Garage, under Illinois laws; authorized capital, $1,000; to manufacture, sell and repair motor cars, conduct a general livery, etc. Corporators—Albert E. Cosey, K. R. Ballentine, S. J. Mathews.

Portland, Me.—Trackless Transportation Co., under Maine laws; authorized capital, $10,000,000; to manufacture vehicles of all kinds for transportation purposes. Corporators—E. E. Noble, E. V. Mann, both of Portland.

Moline, Ala.—Motor Machine Co., under Alabama laws; authorized capital, $25,000; to operate a machine shop for the repair of motor cars and other vehicles and machinery. Corporators—W. D. Bellingrath, Jas. A. Lewis, C. W. Morse.

New York, N. Y.—Ardsley Garage Co., under New York laws; authorized capital, $60,000; to conduct a garage. Corporators—Sigmund Meyer, 230 West 101st street; Max A. Cramer, 153 East 79th street; Jos. Fischer, 115 Broadway.

Brooklyn, N. Y.—Grand avenue Co., under New York laws; authorized capital, $500; to deal in motors, engines, etc. Corporators—Geo. F. Mason, 436 15th street; Fred G. H. Strohsall, 740 Greene avenue; Henry W. Bender, 328 Grand avenue.

Gibsonburg, O.—National Motor Truck & Mfg. Co., under Ohio laws; authorized capital, $250,000. Corporators—Edward C. Russell, C. H. Hutchinson, John H. O'Leary, T. T. Crosett, Frank E. Lamb, Jacob E. Niesel, Nicholas W. Russell.

New York, N. Y.—Packard Auto Exchange, under New York laws; authorized capital, $1,000. Corporators — Benjamin Eisenstein, 959 Jackson avenue; John J. Burgess, 255 West 43rd street; John S. Farran, 1271 New York avenue, Brooklyn.

Brooklyn, N. Y.—Trautman Corporation, under New York laws; authorized capital, $1,000; to engage in automobile tire business. Corporators—Evelyn M. Trautman, 191 Park place; Florence A. Webb, 227 Flatbush avenue; C. Colsten, 903 16th street.

Twombly Tells Why Shouldn't Be Taxed.

To enforce payment of the tax for 1911 on personal property, the City of New York has commenced action in the New York Supreme Court for the County of New York against the Twombly Motors Co. In reply to the complaint, Daniel S. Sherman, who is treasurer of the company, sets forth that the company is absolutely unable to pay the tax and that it never had been taxed previously on the ground that its financial organization was not complete and that it never had done business in the sense implied in the statute. According to Sherman, the company never had a bank account nor did any moneys ever come into his hands as treasurer, the accounts of the company having been kept alive directly by the principal stockholder.

Goodyear Sues Landlord for Deposit.

To compel the return of its deposit of $2,500 made at the time of the signing of the lease on its former branch at 1914 Broadway, New York City, the Goodyear Rubber Tire Co. of New York, has commenced action in the New York Supreme Court for New York County against the Junction Realty Co. On Oct. 3, 1905, the Broadway Reliance Realty Co. leased the property to the Autocar Co. of New York, which later assigned the lease to the Goodyear Tire & Rubber Co., of Akron, O., which in turn assigned to the New York company. At the expiration of the five-year term for which the lease was drawn, the Junction Realty Co. took it over but has failed to return the deposit.

Recent Losses by Fire.

Dormont, Pa.—Wilbur C. Beatty, garage and stable destroyed. Loss, $27,000.

Fall River, Mass.—D. & M. Coughlin, 178 Bedford street, garage destroyed. Loss $6,000.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

Charles C. Munson has been appointed manager of the Splitdorf Electrical Co.'s branch and service station in Philadelphia. Previously, and for many years past, he was assistant manager of the Witherbee Igniter Co., of New York.

A. B. Willemin has been appointed director of purchases for the Hupp Motor Car Co., of Detroit. He succeeds Charles H. Brennan, who retired to set up in business on his own account as an expert appraiser of automobile properties.

Frank H. Smith, who was assistant sales manager of the Studebaker Corporation when Paul Smith was its sales manager, has followed the latter into the Lozier Motor Co. He will act as a special traveling representative, working out of the city of Detroit.

W. P. Sparks, formerly with the Archey-Atkins Co., of Indianapolis, has been appointed sales representative of the Hudson Motor Car Co. for the State of Indiana. As previously he traveled that territory in the interests of the Cadillac car, it is not strange to him.

R. F. Ketchum, formerly manager of the Mack truck branch in Boston, has been appointed manager of the branch in that city maintained by the R. & L. Co., distributors of Garford trucks. He succeeds P. C. Chrysler, who has returned to the R. & L. headquarters in New York.

Frank W. Mailing, for the past two years general superintendent of the Mais Motor Truck Co., of Indianapolis, has resigned that position to assume a similar post with the Stewart Iron Works, of Cincinnati; he will have entire charge of the production of the Stewart one-ton truck.

H. C. Whitney has been appointed Southern district manager for the Lozier Motor Co., of Detroit. He will make his headquarters in New Orleans. For several years, Whitney represented the Alco interests in the South, but more recently was connected with the Locomobile branch in Atlanta.

Omaha Taxicab Companies Consolidate.

Following negotiations which have been pending for a considerable period, the Omaha Taxicab and Auto Livery Co. and the Gray Bonnet Taxi Co. have been consolidated under the style Omaha Taxicab Co., capitalized at $90,000. Its officers are as follows: S. A. Houser, president; G. E. Douglas, vice-president; H. H. Hawke, secretary-treasurer. The Gray Bonnet garage at 2214 Farnam street will be discontinued and the business centered in the Omaha company's establishment at 1201, on the same thoroughfare.

Rodelsberger Sues for Five per Cent.

Because, it is alleged, Herz & Co., of New York City, failed to live up to their contract to pay him five per cent. of their profits during the time of his employment, Carl Roedelsberger has commenced action in the Supreme Court for New York county to compel them to do so. Rodelsberger wants $610.40, which, he says, represents the money due him, but the court has refused his plea that Herz & Co. be required to submit their books for examination by expert accountants.

Rockwell Files Bankruptcy Schedule.

The Rockwell Motor Transportation Co., of which Schuyler C. Carlton was appointed receiver in April last, has been formally adjudicated a bankrupt. Its schedule, filed last week, discloses liabilities of $23,225, of which the largest claims are those of the Swinehart Tire & Rubber Co., $1,416, and the Texas Co., $1,004. The assets listed total $9,244.56, of which $3,000 is represented by 15 trucks and $4.70 by cash on hand.

General Motors Closes a Truck Factory

Carrying out its policy of concentration at its Pontiac plant, the General Motors Truck Co. has discontinued the manufacture of trucks in Owosso, Mich. According to Owosso beliefs, however, the factory in that place will not be wholly abandoned, but later will be used for the production of parts. Meanwhile it will be closed for an indefinite period.

Firestone and Family "Doing" Europe.

H. S. Firestone, president of the Firestone Tire & Rubber Co., has joined the increasing number of automobile tradesmen who are "doing" Europe. He is accompanied by his family and will motor through France and Italy, and possibly Switzerland and Germany. He will return to Akron about September 1st.

Tenth Failure of U. S. Motor Meeting.

They are having a hard time winding up the corporate existence of the United States Motor Co. For the tenth time, the adjourned annual meeting, which was to have taken place on Tuesday last, 15th inst., failed to occur because of lack of a quorum. It has now been postponed until September 23rd.

GARAGEMEN LOSE SECOND ROUND IN SEPARATOR FIGHT

Appellate Division of New York Supreme Court Upholds Right of City to Require Separators—Garagemen Will Appeal.

For the second time, the New York Garage Association has lost its fight against the so-called gasolene separator, but, despite the fact, it probably will fight on.

The second defeat was administered on Friday last, 11th inst., when the Appellate Division of the New York Supreme Court dismissed the appeal from the ruling of the court below, which was to the effect that decision as to appliances necessary to render garages safe rests with the municipal authorities; and as the Fire Department has decreed that gasolene separators shall be installed in New York garages, in order to prevent the escape of gasolene into the city sewers, the New York Garage Association, which is backing the fight against the separator, has no small obstacle to overcome.

The organization's decision to carry the case to the Court of Appeals will probably be reached at a directors' meeting on Tuesday next.

The suit itself was brought in the name of the Joscelyn Stable Co., which operates the Joscelyn Garage, Louis J. Joscelyn being the president of the New York Garage Association. He refused to install a separator, and when he applied for a renewal of his permit early this year, and the permit being refused, he sought a writ of mandamus to compel the issuance of the permit. It is this writ which is the technical basis of the present litigation.

The garagemen do not object to any device designed to achieve the ends aimed at, but they maintain that such separators as are specified by the Fire Department are practically worthless, despite their very considerable cost of installation.

Will Sell Six Cars to Satisfy Lien.

To satisfy a lien held by the Garden Garage Co., six cars owned by the City Taxicab Co., of New York, are to be disposed of at public sale on July 31st next. One of them is a Cadillac 1910 model, the others are all Chalmers-Detroit cars of the vintage of 1909.

Smith Truck Sales Back to Factory.

The truck sales department of the A. O. Smith Co., of Milwaukee, which previously was located in Chicago, has been re-established in the factory in Milwaukee. C. W. Babcock remains its manager.

W. G. Turner and W. Hall have leased the Antioch Garage & Machine Works in Antioch, Cal.

C. E. Mason, of Salem, Neb., has taken over the garage and implement business of Stiller & Son.

E. B. Hedley, of Philadelphia, is having plans made for a large garage at 6th street and Oak Lane.

Ira Chandler & Son, of Santa Ana, Cal., have completed a new garage. It is located on 4th street.

The McKeesport (Pa.) Auto Repair Co. is about to erect a new garage. It will stand on 5th avenue.

William Dobbert and Frank Brixious, of Manitowoc, Wis., have taken over the Split & Boettcher Garage.

Alpaugh & Lance, of Summit, N. J., will open a garage and repair-shop on South Main street, in that place.

R. A. Hendricks, of Hendricks Bros., State street, Santa Barbara, Cal., has taken the agency for King cars.

Dr. William Hake, of Grand Rapids, Mich., will build a one-story brick garage. The estimated cost is $1,025.

Albert W. Dow & Co. are about to open a garage in West Somerville, Mass. The site is at 12 Newbury street.

L. Phelps has opened a garage in Grand Rapids, Mich., on Michigan street. He will handle Cartercars and Kings.

R. L. and J. Frank Myers, of Alexandria, Va., have secured plans for a new garage. They will build on King street.

The Louisville (Ky.) Gas Co. is about to erect a brick garage at 7th street and Ornspy avenue. It will cost $7,000.

Harry Mabber, of Cando, N. D., has opened a repair-shop. He has leased the Torrey Garage for this purpose.

Robert Grider, of Bakersfield, Cal., has leased the car barns at that place and will fit them up as a modern garage.

W. C. Patch, of Cambridge, Vt., has established an automobile livery business in East Fairfield, in the same State.

J. H. Moore, of Santa Barbara, Cal., has let the contract for a garage to cost $25,000. Work will be commenced at once.

Charles E. Burnham, of Worcester, Mass., has awarded the contract for a new garage. It will be built on Murray avenue.

E. O. Weckel and William Laughery, of Springfield, Ill., have opened a garage. They are located at 403 East Jefferson street.

A new garage is being erectel in Arlington, Mass., at 348 Broadway. When completed it will be occupied by A. J. Jensen.

The Adirondack Motor Co., of Glens Falls, N. Y., has awarded the contract for a modern garage to be built at that place.

The Kleinsmith & Hemphill Automobile Co. has been formed in Joplin, Mo. It has opened for business at 6th and Wall streets.

A new building is being erected in Sioux Falls, S. D., for the Van Brunt-Bleeg Auto Co. The location is on North Phillips avenue.

The Horton Motor Car Co. has been formed in Seattle, Wash. It has located on East Pike street and will handle McFarlan cars.

The Jarvis-Bauder Auto Co. has opened headquarters in Grand Island, Neb., on 2nd street. The company will handle Oakland cars.

Charles Morton has leased the building at 207 North street, Baltimore, Md., and will remodel it for an automobile supply house.

The Magic Carbon Remover Co. has opened up in Seattle, Wash., at 1427 Broadway. W. P. Romans is a principal in the business.

The Gerlinger Motor Car Co., of Portland, Ore., has opened a branch in Seattle, Wash., on Pike street. Arthur H. Hertz is manager.

The General Motors Truck Co. is putting up a building at 19th and Arch streets, Philadelphia, to be used for offices and salesrooms.

J. B. Willoughby is about to enter the trade in Eugene, Ore. He will establish a vulcanizing and tire repairing business on 9th avenue.

John Stuben, of Omaha, Neb., has received authority to erect a brick garage at 2818 Leavenworth street. The estimated cost is $3,200.

L. H. Misner, of Petaluma, Cal., has bought his partner's interest in the Main garage and will continue the business under the old name.

C. B. Wiggins, of Champaign, Ill., has opened an automobile salesroom in a new building on Hickory street. He has the Cadillac agency.

Digitized by Google

Oscar R. Hutchinson, of Lenox, Mass., has secured plans for a two-story, fireproof garage, 160 x 40 feet. He will operate it when it is completed.

The Gardner Auto Co., of Gardner, Mass., is having a garage built at a cost of $10,000. It will be of brick, two stories high and modern in every respect.

Elmer Halley, of Poplar Bluff, Mo., is about to open a garage and repair-shop. He has purchased an old iron works plant and will remodel it for his purposes.

E. R. Robinson and J. M. Short, formerly of Courtney, N. D., have opened a garage and repair-shop in Pingree, in the same State. The style is Pingree Auto Co.

T. J. Murray, of Elwood, Ind., has purchased the Central Garage, located on 12th street, in Anderson, in the same State. He will install a modern repair equipment.

Frank Norris has withdrawn from the firm of Norris & Blakesly, of Thomaston, Conn., and the Park Garage, which the firm operated, will be run by Blakesly alone.

Permission has been granted to N. Ledgerwood to build a garage in South Pasadena, Cal., at 1416 Mission street. The application states that the building will cost $6,000.

Fred Campbell, of St. Louis, Mo., has leased a building at 1109 Locust street and will remodel it for his business. He is an accessory dealer and now is located at 1127 Olive street.

A. L. Trachte, of Dodgeville, Wis., has sold his interest in the Iowa County Automobile Co. to his partner, F. W. Woerpel. The latter has admitted John Thomas, Jr., to the business.

Pat Lockwood has purchased the Lattner garage business in Cedar Rapids, Iowa, and will operate it under the name of Lockwood & Co. Lockwood was in charge of the Lattner garage for a year before purchasing it.

P. P. Bishop and C. A. Schmidt have taken over the garage formerly conducted by the Dubuque Auto & Garage Co., of 6th street, Dubuque, Iowa, and will continue the business under the name of the Dubuque Auto Supply Co. The garage will be remodeled and enlarged.

A. J. Diefenderfer, former manager of the Lozier branch in New York, and Teddy Hayes, who previously was in charge of the Lozier used car department, has joined hands and set up for themselves in the used car business. They have opened up at 19 West 62nd street, New York.

The Western Reserve Motor Co., 6604 Euclid avenue, Cleveland, which previously handled the Garford trucks in that city, has been succeeded by the Overland-Garford Sales Co., which hereafter will handle not only Garford trucks but Overland cars. M. L. Bridgeman, who was connected with the sales department of the Willys-Overland Co. and who became manager of the Western Reserve company several months ago, will continue to serve its successor in that capacity.

Adolph C. Hoppe, who recently retired from the Smith-Hoppe Automobile Co., of Milwaukee, Wis., which handled the Chalmers, R. C. H., and Detroit electric, has organized the Hoppe-Hatter Motor Co., which will act as State agent for the Chalmers product. C. P. Hatter, secretary and treasurer of the new concern, was previously connected with the Chalmers factory. Temporarily the Hoppe-Hatter Co. will be located in the New Mulkern Garage, at 1604 Downer avenue.

On the Trail of Munsing's Tractor.

Three judgments, totaling $4,368.04 in all, have been entered against the Munsing Tractor Co., of New York City, which about a year ago announced its intention of marketing a tractor of a character calculated to at least partially revolutionize the industry, but never got very far toward that end. Two of them—$622.45, in favor of J. H. Westcott, and $1,725.62, in favor of G. D. Munsing, who was the vice-president of the company—are for services rendered, and the third, which amounts to $2,019.96, and is in favor of C. E. Ingersoll, represents money loaned.

California Tire Project to be Enlarged.

Although the tire plant being erected in Torrance, Cal., for the Hendrie Rubber Co., of Denver, is not yet fully completed, it is stated that the Hendrie interests are about to place contracts for additions that will triple its size and capacity. For the first time, it has been made known that N. S. Ballentine, a Denver cattle and mining millionaire, is interested with W. C. Hendrie in the tire project.

Stevens Branch Opened in San Francisco.

As the outgrowth of a visit paid to the Pacific Coast by President Whiteside, a Stevens-Duryea branch has been established in San Francisco. It is in charge of J. W. Barber, former manager of the Stevens branch in Chicago. W. F. C. Zimmerman, who represented the company on the Coast during the past year, will be Barber's assistant.

Three Judgments Against Brooklyn Dealer.

Judgments totaling $614.86 last week were entered against A. W. Blanchard, Inc., the Brooklyn (N. Y.) Fiat dealer, the Standard Oil Co. of New York, whose claim amounts to $576.90, being the largest creditor. The remainder represents $17.05 awarded the Fisk Rubber Co., and $20.91 awarded the Yellow Taxicab Co.

Making Ready for Federal Parts.

The Federal Pressed Steel Co., of Milwaukee, which has completed a large plant at Keith avenue and North Pierce street, in that city, has increased its capital from $50,000 to $150,000, preparatory to beginning actual operations. It is the company's intention to conduct an aggressive campaign in the automobile parts industry.

May Make "Sixes" in Bellefonte.

If plans which are now incubating come to a head, the Bellefonte Automobile Mfg. Co. will locate in the Pennsylvania town of that name and produce what is known as the Bellefonte "six." E. R. Bloaker, of Franklin, Pa., is president of the budding concern.

Ten Years' Receipts from Importations.

During the past ten years, according to figures compiled by the New York Custom House, the United States treasury has been enriched to the extent of $10,123,427 by the importation of automobiles, which represents 45 per cent. duty on 8,774 cars; their value aggregated $22,507,615.

McKone's Kerosene Karburetter Koming.

L. J. McKone, a former automobile dealer in Oshkosh, Wis., who now is located in Santa Ana, Cal., has formed the Duplex Carburetter Co. in the latter city. The device is designed to burn kerosene and the heavier fuels.

"Sun-Lite" on Tap in Milwaukee.

The Gas Tank Recharging Co., of Milwaukee, which will employ the trade mark "Sun-Lite," has opened up at 256 Fifth street. John J. McJesley is president and Fred J. Pagels is secretary and treasurer of the company.

Reddest Month in History of Fords.

Of many red-letter months in the history of the Ford Motor Co., June was the reddest. During that period, the Detroit plant produced 22,049 cars. This surpasses the previous record, made in April last, by nine cars.

Bramwell Over the Bounding Billows.

R. B. Bramwell, advertising manager of the Michelin Tire Co., sailed last week for a vacation in Europe. He was accompanied by Mrs. Bramwell and their son.

Lee Tire Opens Branch in New Jersey.

The Lee Tire & Rubber Co., of Conshohocken, Pa., has established a branch in Newark, N. J., at 282 Halsey street. It is in charge of B. W. McCabe.

NEW YORK, JULY 17, 1913

BRAKES AND ACCIDENT PREVENTION.

It often has been said that the brakes constitute the most important part of the equipment of a car, and most observant persons will readily admit that there is much truth in the assertion. That they withstand the terrific abuse to which they are daily subjected is not short of remarkable. The remarkably low percentage of accidents sustained by automobiles in the ordinary course of street driving is a tribute to the perfection of this part of the machine's mechanism, as well as to the skill of drivers and their faith in the brakes.

Of the accidents that do occur, however, a considerable percentage might be avoided if drivers would school themselves to refrain from the too common practice of taking things for granted. The habit of making snapshot calculations where many factors are involved has undone many a driver and wrecked many a car.

Two sets of conditions are involved in such calculations, viz.: those within the car and those which are external to the car. The average driver approaching a street crossing that seems to offer a clear passage will approach at a considerable speed with his clutch in and the motor driving the car, placing all his faith in the brakes and his own quickness in applying them should anything appear to block the way.

Ninety-nine times out of a hundred, perhaps, he will be quick enough in kicking out the clutch and applying the brakes should this become necessary; but probably not one driver out of fifty ever gives a serious thought to the actual possibility that either the clutch or brake mechanism might fail at the critical instant, or that he himself might fail to accurately carry out his own intentions. Did he make proper use of his reasoning powers he would not begrudge the ridiculously small expenditure of time and energy required to bring the car under complete control before running into possible danger. In other words, he does not begin slowing up soon enough. Seeing, he too often thinks he has been or will be seen in time.

The way in which a driver may be misled by conditions external to his car is illustrated by an accident which recently occurred and which is only one of a number of the same sort. The driver of a light truck, approaching from a cross street an avenue traversed by trolley cars, saw that there was a car standing on the near side of the crossing and that half a dozen persons were waiting to board it. The driver's subconscious calculation that before the people could get aboard he could be across the track with a wide margin of safety would have been correct in an overwhelming majority of cases, as would his assumption that, anyway, the motorman, even if he did start up sooner than anticipated, would see the truck and act accordingly.

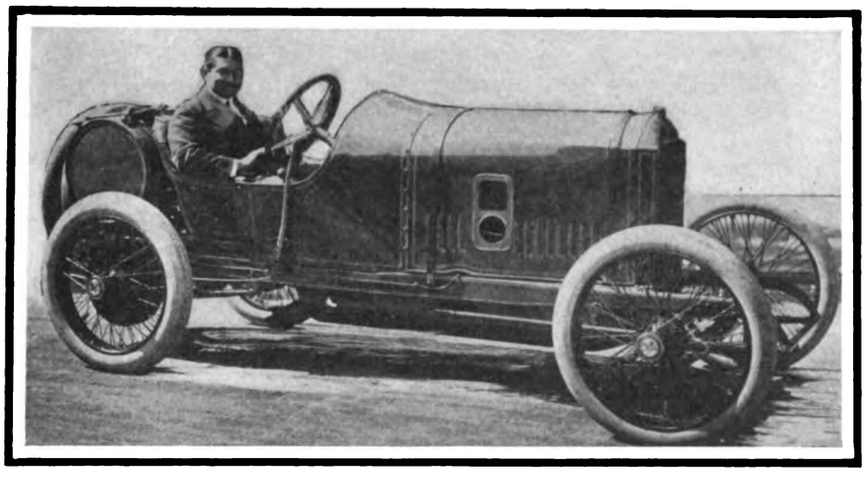
But it happened that just as the truck driver withdrew his head behind the side panel, the people for some reason decided not to board the car, and the motorman threw his controller around while looking backward. When he turned his head he was within ten feet of the truck, and the driver never suspected that two of the premises on which his calculation was based were erroneous until he was almost thrown from his seat by the impact.

While the automobile is a wonderful piece of mechanism and is amazingly dependable, there never was and never will be anything made by human hands that is infallible, and anyone who throws caution to the winds and depends wholly on his brakes is bound to lose in the long run.

WHAT NEXT IN REFINEMENT OF DETAILS?

"Refinement of details" has come to mean many things in many places but that it has real meaning in some places there is ample evidence. When the effort is made, there seems no limit to what the refining hand can do in adding comfort and conveniences to a car.

Electric illumination of the instrument board and of the runningboards is not new, and is rightly considered a detail improvement; but now comes a manufacturer who carries the refinement further by putting several little lamps on the instrument board so that not only all the dials are illuminated, but also the levers and the floorboards. And going still further, lenses are placed in the side lamps so that at all times a bright beam of light is thrown on each of the runningboards, while a similar lens in the tail lamp throws light on the gasolene gauge.



Truly this is refinement and constitutes a good illustration of the searching thought and painstaking effort that now marks the industry and which inevitably leads to the question, What next?

BOILLOT "COMES BACK" IN FRENCH GRAND PRIX RACE

Covers 568-Mile Course with Peugeot at 72-Mile Pace Under Unusual Fuel Restriction — One Spectator Killed.

Over an extremely narrow course, half winding and half straight, that had proven the despair of all those who turned out for practice, and under fuel restrictions that caused even more despair, Georges Boillot, at the wheel of a Peugeot, for the second time won the French Grand Prix road race, which was held on the Amiens course in France on Saturday, 12th inst. His time for the 29 laps of the course, which measures 31.621 kilometers—19.6 miles—was 7:53:56, and his average speed for the 568 miles figures out at 72 miles an hour. Jules Goux, who won the 500-mile International Sweepstakes race on the Indianapolis Speedway on Decoration Day with a Peugeot, was second in another car of the same make, a little less than 2½ minutes behind the winner; his exact time was 7:56:22. Chassagne, who drove a British Sunbeam, was third.

GEORGES BOILLOT IN THE PEUGEOT WITH WHICH HE WON THE GRAND PRIX

Almost from the start of the race Boillot had things pretty much his own way, and in repeating his victory of a year ago, though it was a victory of an entirely different sort, he beat the best there is among foreign racing talent and foreign cars. The complete list of starters and the order of starting was as follows: Chassagne (Sunbeam), Bablot (Delage), Joerns (Opel), Esser (Mathis), Christeans (Excelsior), Croquet (Th. Schneider), Nazzaro (Itala), Goux (Peugeot), Resta (Sunbeam), Guyot (Delage), Hornsted (Excelsior), Gabriel (Th. Schneider), Pope (Itala), Boillot (Peugeot), Callois (Sunbeam), Champoiseau (Th. Schneider), Moriondo (Itala), W. Lee Guiness (Sunbeam), Thomas (Th. Schneider).

The race this year was almost as different from the race last year as it was possible for it to be. Last year, the contest was held over the Dieppe circuit and the distance was 956 miles, two days being required to complete the distance; the cars were placed under lock and key at the end of the first day and sent off the following day in the same order in which they finished the first half. The race was divided into two sections, and it was in the "unlimited" class that Boillot finished first, his time for the 956 miles being 13:58:02⅘, which is at the rate of 68.45 miles an hour. Previous Grand Prix races in 1906, 1907 and 1908 went to Sisz (Renault), Nazzaro (Fiat) and Lautenschlager (Mercedes), respectively.

The race this year was over the narrowest course that ever has been used for a similar purpose; in only a few places was it possible for two cars to pass, and for the most part the roads are lined on both sides by giant trees that presented an ever-present hazard. The first eight miles, from Amiens to Rheims, and starting from a point just beyond Longueau, is perfectly level and straight and it was here that the greatest speed was made; the remainder of the course is a succession of turns and twists with several right-angle corners and a genuine "hairpin" at the grandstand end. Due to the fact that the roads were not opened for practice until the last few days before the race, few of the drivers were as familiar with them as should have been the case.

But even if they had been perfectly familiar with every inch of the roads, it is extremely doubtful if any better speed would have been made, because of the unusual fuel restriction that was included in the conditions. Figuring the length of the course, only enough fuel, at the rate of a fraction over 11 miles to the American gallon; each car was doled out just 183.3 liters of gasolene at 15° Cent., which is equal to about 48.5 American gallons. Hence it was necessary for the competitors to juggle not only their speed but their fuel consumption as well. The race could not have been won without sparks, of course, and these were furnished both the Peugeots by high-tension Mea magnetos; the wheels of the cars spun 'round in S. R. O. ball bearings.

One fatality marked the running of the race. When driving at high speed, Lee Guiness and his British Sunbeam skidded to the side of the road following the bursting of a tire and struck a spectator who subsequently died as a result of his injuries; neither of the occupants of the car was hurt.

15 KEEP CLEAN SLATES ON ROUTE TO GLACIER PARK

Started in Downpour, Reliability Tour Early Becomes Mud Fight that Soils Nine Scores — One Car Withdrawn.

Haberdashers and clothing merchants in the immediate vicinity of the Hotel Radisson in Minneapolis, Minn., did a rushing business in raincoats on Friday morning last, the specific reason for the "rush" being the start of the American Automobile Association's National Reliability tour to the accompaniment of a terrific rainstorm; the 24 cars that make up the procession that is wending its way to Glacier Park were started on their 1,300-mile journey at 9 o'clock in a deluge which continued during the whole of the day.

Despite the rain and the slippery, sloppy, muddy roads, however, all of the cars pulled into Alexandria, Minn., the first night stop, on time, though not all of them were so lucky in reaching subsequent halting places according to the schedule that had been laid down. In attempting to do so, nine of them came to grief and of the nine one will run no more; L. C. Nelson withdrew his Chalmers shortly after leaving Devil's Lake, N. D.

With just about half the journey completed, the scores of the 23 survivors as they were posted at Minot, N. D., the night stop after the fifth day's running, were as follows, each point less than 1,000 representing one minute lateness at control:

No.	Entrant and car.	Score.
3	H. F. Legg, Stutz	1,000
5	G. H. Voter, Metz	1,000
6	Chas. Metz, Metz	1,000
7	G. W. Metz, Metz	1,000
10	Northwest Auto. Co., Krit	1,000
14	R. W. Munzer, Hupmobile	1,000
15	R. W. Munzer, Hupmobile	1,000
17	E. B. Stimson, Chalmers	1,000
20	E. A. Everitt, Locomobile	1,000
26	——, Premier	1,000
4	L. H. Fawkes, Premier	995
8	Northwest Auto. Co., Krit	992
11	Dr. C. A. Smith, Kissel	980
12	L. C. Erbes, Velie	980
21	F. J. Lyman, Maxwell	930
16	J. A. O'Brien, Little	894
18	Dr. E.W. Humphreys, Locomobile	640
9	Northwest Auto. Co., Krit	430
19	L. C. Newlon, Chalmers	Withdrawn

Long before the tourists reached Alexandria, hopes of a real "joy ride" were shattered, and though Dr. S. E. Dutton, who has the tour under his wing, so to speak, facetiously remarked that "the roads are a cinch because they have bottoms to them," there were those who were not inclined to agree with him and among them were those who rode in the Mitchell pathfinder. Twice in two days the car skidded off the road into the ditch, and each time it had to be hauled out by a team of horses; no one was hurt, though as a result of the last deviation from the beaten — or, rather, whipped—trail, repairs made necessary the transfer of the official party to one of the Stutz entries.

Penalties allotted the first day were as follows: L. H. Fawkes (Premier), 5; Northwest Auto. Co. (Krit), 8; Northwest Auto. Co. (Krit), 70; Dr. C. A. Smith (Kissel), 5; J. A. O'Brien (Little), 87; Dr. E. W. Humphreys (Locomobile), 306; L. C. Newlon (Chalmers), 57; F. J. Lyman (Maxwell), 55; L. C. Erbes (Velie), 4.

During the second day the rain let up a little in the morning, though it came on again with renewed strength in the afternoon and the roads that were merely boggy before soon became veritable quagmires. Slipping and sliding, the cars were pushed through the mud until at the noon control the ladies in the cars deserted en masse and took up more comfortable quarters in the hotel train, which meets the tourists at noon and night stops and provides them with three square meals a day and dry beds at night. The hotel train, by the way, is proving its worth, for already work has been found for the oxy-acetylene welding plant and the automobile repair shop carried on the "garage" car. Also, the "Glacier Park Blazer," as the printed-on-board paper is styled, is appearing regularly and drawing laughs and near-laughs from those who read it.

On the second day's run of 123 miles to Fargo, N. D., the tourists struck the first fair roads encountered, and though it was still raining and the surface was slippery in spots, the "going" was better, on the whole, than it had been the previous day. In the afternoon, sticky roads again were encountered and, fearing to tackle the "gumbo," the route was changed, adding - miles to the distance; despite the addition, however, all of the cars got in on time, for there was ample opportunity to make up the loss on the broad boulevard that leads from Hawley to Fargo. At night the tourists were the guests of the Fargo Commercial Club at a smoker, and all the following day they loafed in Fargo recuperating for the plug of 195 miles—the longest day's run of the tour—to Devil's Lake, N. D.

Penalties allotted the second day were as follows: J. A. O'Brien (Little), 19; Dr. E. W. Humphreys (Locomobile), 19; F. J. Lyman (Maxwell), 24; L. C. Erbes (Velie), 16.

During the run from Fargo to Devil's Lake the roads were considerably better than had been encountered up to that time, and for the first time the tourists caught up with the pacemaker and all 23 proceeded in an unbroken string. The rain had stopped and the speed increased, and with it the dust arose in clouds and marked the passage of the fleeting cars in no uncertain manner. Chairman A. G. Batchelder of the executive committee of the A. A. A. had a painful experience during the run that he is not likely to forget for some time; as the car in which he was riding passed over an unusually abrupt obstruction in the road he was propelled upward and his head struck the top, rendering him unconscious; he was soon revived and exhibited little sign of the bump.

"The best running yet," was the general verdict when the night stop was made at Minot, N. D., after a run of 132 miles over fairly good roads and with the sun shining brightly again during most of the trtip. For the first 10 miles out from Devil's Lake the weather looked threatening, and occasional showers raised the hopes of the mudlarks; but apparently the weatherman has taken the tour into his good graces again, for a time at least. Nothing more exciting than the killing of a few gophers, which are numerous, and a little shoveling bee in a swamp hole enlivened the run from Rugby, the noon stop, to Minot, where the tourists climbed aboard the hotel train for the night.

On Saturday, 19th inst., the tour will come to an end at Glacier Park, and little of a really exciting nature is expected on the 600-mile run, which for the most part will take the motorists over fairly good roads. So far, the lights cars, the Hupmobiles, the Metz trio and the Krits have had the best of it, because of the heavy roads, and only one of them—a Krit—has been debited.

Lincoln Highway Assn. Takes Charge.

Carl G. Fisher, of Indianapolis, who originated the ocean-to-ocean highway movement, has formally turned over to the Lincoln Highway Association all of the pledges which have been received to date; they are in excess of $4,200,000.

The Lincoln Highway Association itself has completed organization by securing a charter under Michigan laws and electing the following officers: Henry B. Joy, president; A. R. Pardington, New York, vice-president and secretary; Emory W. Clark, Detroit, treasurer. The board of directors comprises these officers and Paul H. Deming and A. Y. Gowen, of Cleveland. Russell A. Alger and Roy D. Chapin of Detroit and F. A. Seiberling of Akron.

The association will maintain offices in the Dime Bank Building in Detroit, which will be in charge of A. R. Pardington. President Joy is so enthusiastic that he believes that many long stretches of the highway will be completed before the opening of the San Francisco exhibition in 1915.

CAMPAIGNING WITH A PLAN

Methods of One Man Who Combines Banking with Selling Cars and Never "Goes Back"—Unusual Method of Recruiting Sub-Dealers.

Charles Bopp, of Hawkeye, Iowa, is a banker by profession. He also sells Ford cars. He is full of energy and believes in the theory that progress means selling two Ford cars—or even three—where one was sold before. According to this theory, he has made good. From a banker's standpoint, he has made good, too. He is a man of quick action, but he uses his brains and his pencil before he acts. In other words, he figures things in advance and thus usually knows what he is going to do before he does it.

He believes in small territory and concentration. He has a number of sub-dealers—and where he has no sub-dealer and wants one he usually gets one.

"How do you get sub-dealers in those small towns?" he was asked.

Inspiration of an Increasing Income.

"Well, often I just go to the bank and call on the banker. Like as not he has a young man working around town for $40 or $50 a month. I suggest that he start the boy in a business where he can make some real money. If he is any good at all, he can do it. One fellow I started this way took three cars as his first order. He had them sold in two weeks. In three months he had taken 15 cars. That meant a pretty good income for him. And an increasing income is a mighty fine inspiration. Where there is no bank and I cannot interest the banker or his son, or some merchant, I look for some live young man who wants a chance to make good. One of my best workers is a fellow who was formerly a butcher. I have no system; I just use common sense backed by a determination to sell just as many cars as the territory ought to have."

Stays on the Job Till it's Finished.

When Mr. Bopp makes a trip through his territory he closes business. He does not wait till next time he comes around. To-day, not to-morrow, is Bopp's motto. If a man tells him he will do so-and-so next week, Bopp tells him he won't be there next week and, if necessary, he stays on the job three or four days, in one place. He has always held that a tremendous amount of time is wasted by "going back"—and this determination of his to do business **to-day** has been an important factor in his success. It is hard to resist a man who is really determined and shows it by staying on the job. Sixteen cars sold at retail in four days is a good record for any man—and especially good for a man who has the cares of a banking business resting on his shoulders and the responsibility for a fair-sized territory besides. Work and plan — plan and work; that's how Bopp does it.

KEEPING GOODS IN STOCK AND DISPLAYING THEM FOR SALE

Keeping the goods in stock is a way of getting and keeping the business that is as old as the hills and invariably works—especially if you let the people know that you have the things they need and want.

To many dealers "keeping the goods" means having them in the stockroom under lock and key, where they are never seen except by the person who is definitely seeking a particular article.

As a result, there is never any suggestion to car owners that they buy something—there is none of that subtle influence that works on you as you pass a haberdasher's shop and makes the sale of a necktie or a new shirt or new hat to you when you had no idea of purchasing it.

And yet there is no reason in the world why the automobile owner cannot have his desire for various articles of equipment awakened in the same way. All that is necessary is to have the goods in stock and then display them by means of properly dressed windows or up-to-date show cases placed where they will be seen. Every day or so your customers come to you for the necessities, but what are you going to sell them more than they came for? That is a question every wideawake dealer and garageman should put to himself. Are you a wideawake?

WHO IS ABLE TO DEFINE "SERVICE" WHEN QUESTIONED?

The word service is much used in business nowadays and, indeed, it has become so much abused that whenever a man can think of nothing else to say about his business he begins to talk about service. Sometimes it is real service and often purely imaginary. In the main, however, is the idea and intention of giving some kind of service.

Certainly, no word ever has achieved a greater variety of shadings and meanings. The public is growing used to the indefiniteness and vagueness of this much-worked term, and it not infrequently happens that a prospective purchaser will ask the salesman to define exactly what he means by "service." Have you got it figured out so far as you are concerned? What answer would you give or do you give when asked this question? Do you know just how deep you can afford to go?

Stated briefly, "service" is taken to mean that you will give the buyer a square deal all the way through. Just where this begins and ends is a question worth much study and getting down to "rock bottom."

Who in your shop knows when a repair job is done—finished? Who checks up to see that it is right? Do you do it or do you wait for the customer to kick?

"SIDE LINES" THAT PAY BILLS

Sale of Accessories that Helped Fore-Handed Man and How it Will Help Others, too—Turn no Trade Opportunities Away.

"I really do not know what we would do if it were not for the 'side lines.' We would make a living, of course. There is enough business for that; but the business would hardly be worth while. I was figuring the matter out the other night—and it surprised me to learn how much we were doing," said a dealer in a town of 16,000 inhabitants. "Yes, it is the side lines that keep us in business and enable us to admit that we are actually making money."

Foresightedness Worthy Imitation.

This is the idea that animates the grocer who sells seeds, paints and oils and other things in the semi-rural community. It is the idea that animates the druggist who sells cigars, ice cream soda, cameras and the thousand-and-one things like stationery, etc., which actually have no place in the drug business. It is the idea that makes the hardware man reach out and stock liberally with tire chains, spark plugs, oil cans, wrenches and the hundreds of small things that the automobilist needs and must have.

There are automobile dealers all over the country who have come to a realization of the profitableness of stocking lines that actually belong to their business, but there are still thousands who are blindly passing up the big opportunity that is open to them and is actually an important and fundamental part of their business.

"Have you got a 34 x 4 inner tube?" asked a motorist of a garage dealer a few nights ago. "No, I think you can get it at the garage on the left-hand side of the street two blocks down," was the reply.

Every day hundreds of possible sales are being missed and turned away by some similar reply. How do they fare when they come to your establishment?

HOTEL-SEEKING THAT TAUGHT DEALER A USEFUL LESSON

Neatness and cleanliness never fail to attract trade. The right kind of buyers always appreciate it. It is an outward and visible sign of correct business ideals that goes straight to the heart of the buyer whether it be of automobiles, accessories or any other merchandise.

A Chicago dealer who took a run over to Mackinac Island to escape the noise and heat of the "Fourth" had this fact brought home to him in a way that gave him a new appreciation of the advertising, business-getting value of such apparently simple things as clean windows and fresh paint.

"As we walked up the dock," said he, "we were besieged by the usual army of hotel 'runners,' each urging the claims of his particular house. As we had never been to Mackinac before, we concluded to stroll around and size up the various hotels from the outside before taking any chances.

Cleanliness Alaways Draws Trade.

"Turning to the left, we walked up the main thoroughfare as far as the Grand Hotel, which had not yet opened its doors for the season. Nothing appealed to us. Sauntering in the opposite direction, my eye caught sight of a solid-looking place, newly painted, every window clean and glistening, chairs on the verandah freshly varnished, etc. It looked good to me, but before I had a chance to speak, my wife said, 'Let's go there; it looks so clean and nice.'

"Needless to say, we went there. Every promise made by the clean, bright exterior was fulfilled on the inside. Meals were good, service excellent, rooms clean—away above par. If some of our sub-dealers had been there it would have made them appreciate, just as I did, what a force for drawing trade lies in clean windows and fresh paint.

HERE'S ANOTHER DEALER WHO MAINTAINS DECENT WASHROOM

Another dealer who provides adequate toilet facilities for customers, including mirror, clean towels, soap, nail brush, whisk broom, etc., has been discovered. It is the Foster Motor Sales Co., of Detroit. This is something a garage really owes to its customers, because dirt and grease around an automobile are, notwithstanding all the improvements, as "sure as death and taxes." It does not cost much to place toilet conveniences at the disposal of one's customers and experience shows that it makes a great hit. But an unpleasantly large number of garage keepers fail utterly to realize the fact, or if they realize it, fail to act.

WINDOW DISPLAYS HAVING THE "BETWEEN-SEASON" APPEARANCE

Many automobile stores are already beginning to wear a "between-seasons" look. That is to say, the aggressive effort to put life and spirit into window displays is noticeable by its absence. This is just the time when the buyer who has been "putting off" is liable to come to a sudden decision. Whether or not it will be your way may depend much on how your store looks as he goes by. Supposing other dealers are indifferent, won't your cars make all the stronger impression if properly and carefully and attractively displayed? Think it over and devise some plan to ginger up and put new life in your displays.

Don't be afraid to copy a good idea just because somebody else thought of it first. There is nothing really new. It always existed somewhere sometime. Like the gold that is discovered, it was always there. Make the idea yours by using it.

ROAD CONDITIONS ENCOUNTERED BY THE "MADE-IN-INDIANA" TOURISTS ON THEIR HIKE TO THE PACIFIC COAST

1 AND 2—PHOTOGRAPHIC EVIDENCE THAT IN SOME PARTS OF MISSOURI THEY HAVE NOT YET BEEN SHOWN HOW TO BUILD IMPROVED HIGHWAYS., 3--WAITING FOR ONE OF THE MANY FERRIES EN ROUTE. 4—EVEN MUD COULD NOT SUPPRESS THE INDIANA SMILE

Digitized by Google

"BOOST INDIANA" TOURISTS HALF WAY TO THE COAST

Brave Heights and Rains and Have Snow-Ball Battle en Route—Near-Accidents Cause Many Thrills.

The A. A. A. National Reliability tourists are not the only ones who have reached the halfway mark in their long journey, for the Hoosier tourists, representing the Indiana Automobile Manufacturers' Association, also have covered considerably more than half the distance between Indianapolis, the starting point, and Los Angeles, Cal., where they are due to arrive on August 2nd. To-night (Thursday) they rest in Salt Lake City, which is just 2,023 miles from Indianapolis, and they will remain there all of Friday, 18th inst., taking a fresh start Saturday morning for Ogden, Utah, which leg, by the way, will be the shortest one on the tour.

Although no serious mishaps have marked the trail of the "boosters," there have been many near-accidents that have caused more than one heart to beat faster. From Colorado Springs, where the tourists rested last Thursday night, to Denver, which was the next step, probably will go down as the hardest part of the trip, for what with the high altitude, which interfered with proper carburation, the narrow, precipitous roads and a small amount of rain that made the surface slippery in places, those who handled the cars had their hands pretty full. The total mileage on the run was only 69 and a fraction, according to the original schedule, but because of the great amount of improvement work that is being carried on, this had to be stretched out to more than 73—still a rather short day's run but a strenuous one withal.

All the way from Colorado Springs to Denver the tourists were escorted by a procession of some 20 cars that had traveled from Denver for the purpose; and if the tourists had had any trouble in following the confetti trail laid down by the pathfinder they would have had no trouble at all in picking the proper route because of the cars that waited by the roadside for the tourists and then trailed along behind them. In Denver, the tourists were royally welcomed by the Board of Trade, though it is likely that the best thing they saw in the mountain city was the public bath, which was reserved for their exclusive use and to which they were escorted after dinner at the Brown hotel. It was in the Berthoud pass that the greatest difficulty with carburation was experienced—the elevation is 11,305 feet—though none of the cars failed to make the climb. The ascent is laborious and, though grandly picturesque, is impracticable for ordinary tourists. Frequently grades of upward of 15 per cent. were encountered, which, coupled with the altitude, made the "going" very hard. The turns, too, were very short and abrupt and often masked by trees and rocks.

Between Denver, where the tourists remained over Sunday to make a fresh start on Monday morning, and Hot Sulphur Springs, even more trouble with carburation because of the high altitude was experienced; the total distance covered was 90 miles. Despite the name of the city, it is not as hot there as might be supposed; in fact, it is very cold. On the Continental Divide an immense snowbank was encountered, and every one stopped long enough to take part in a pitched battle with snowballs.

On the following day, the trail led for the most part over narrow ledges of rock where an error of a few feet in judging distance meant instant destruction on the rocks below. Slight rain in the afternoon run to Glenwood Springs — 104 miles from Hot Sulphur Springs—made the roads, such as they are, slippery and added to the danger, though nothing occurred to mar the day's run.

The run from Glenwood Springs through Grand Junction and Green River to Salt Lake City, where the tourists rest all day to-day, was practically a repetition of what had gone before—a succession of ascents and descents over roads and near-roads with frequent stops to permit the spellbinders to sing the praises of Indiana-made products and the proposed Lincoln transcontinental highway. Next Thursday, 24th inst., the tourists will invade California and 10 days later they will reach their desination.

To Partly Open Yellowstone Park.

After several years of resistance, the government is about to rescind its order forbidding automobiles to enter Yellowstone National Park. The new order of things, however, will not render available to automobiles the "loop" or main road traveled by the horse-drawn stages which so long have made the circuit of the reservation, which means that the latitude is extremely circumscribed and will permit motorists to traverse only the little-used roads. When they reach the "loop" they must transfer to horse-drawn carriages, or stage, or retrace their way. Most of the roads which will be opened to motor cars are rough and narrow, but army authorities who are in charge of the national reservation are widening them with a view to their use by automobilists.

ROTATING-CYLINDER AND ROTARY MOTOR CONTRASTED

Presence or Absence of Reciprocating Parts that Marks Dividing Line—Meaning of Revolving and Rotating Defined.

Due, perhaps, to a too ready disposition on the part of some persons to accept as a true definition of something a mere hazy idea in which no parts of the real definition can be found there exists no little misconception as to what constitutes a rotary engine and what constitutes a rotating-cylinder engine; there is a great tendency, particularly among laymen, to style rotary engines, as scarce as they are, as rotating—or revolving—cylinder engines, or vice versa, whereas, as a matter of fact, these two types of engine are no more alike in either appearance or construction than an automobile is like an aeroplane—in which, almost exclusively, is the rotating-cylinder engine used.

As its name implies, the rotating-cylinder engine is one in which the cylinders rotate around the crankshaft, which is stationary; the pistons and connecting rods therefore reciprocate, and this establishes the vital difference between the rotary engine and the rotating-cylinder engine, or, as it sometimes is not altogether correctly styled, the revolving-cylinder engine. Rotary used as an adjective in this sense is more correct than is revolve, for according to engineering text books, anything is said to rotate which turns about its own axis; things which turn about an axis other than their own are said to revolve, from which it follows that the actions of rotation and revolution may go on at the same time. Thus, for instance, the earth rotates about its own axis and revolves about the axis of the sun.

As far as automobiles are concerned, there is no commercially practical rotary internal combustion engine as yet, though brave hopes are held out for its perfection some time in the future. There are gas turbines aplenty—these are true rotary internal combustion engines—but they are great, heavy machines suitable only for stationary work, and though they have been brought to an astonishing state of perfection during the past few years, the limit of development has not yet been reached; there still remain several stumbling blocks in the path of inventors. The steam turbine is a true rotary engine, for there are absolutely no reciprocating parts in its make-up, and this cannot be said of any of the so-called rotary internal combustion engines that at various times have made

Digitized by Google

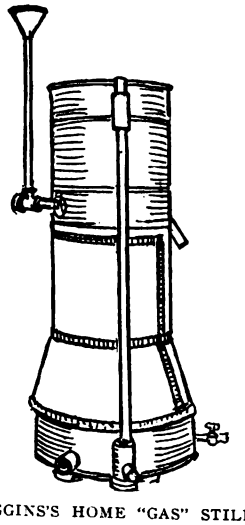
their appearance and then quietly disappeared.

None of them, of a size suitable for use in an automobile engine, has been entirely free from reciprocating parts, as is the case with the steam turbine. Hence they are not as desirable as the ordinary reciprocating engine for automobile use or the rotating cylinder engine for aeroplane use, for both of these engines have been developed very nearly, if not quite, to the limit, and it is doubtful if their efficiency, mechanical or thermal, ever will be increased very much beyond its present comparatively high level.

Both rotary and rotating-cylinder engines have been used to propel automobiles—it would be difficult to discover any one kind of an engine that has not at one time or another been actually tried or suggested for trial in an automobile—though neither has amounted to anything. Probably the rotating-cylinder engine never will be used, to any extent at least, for automobile work, for the vertical reciprocating engine has been found quite satisfactory. But, if a true rotary internal combustion engine minus all reciprocating parts should be developed, which is not unlikely, it is highly probable that a new era in automobile construction would commence from that day, for not only would size and weights of parts be considerably decreased, but vibration, the bete noir of the average designer, would be positively eliminated.

Hardened Oil Which Affects Valves.

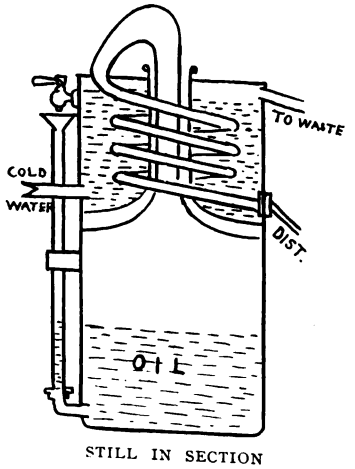
The action of valves sometimes is interfered with by a ring of hardened oil which collects just above and below the actual valve seating, and occasionally holds the valve off its seat for an instant if the stem is a trifle loose in the guide. The remedy by scraping off the deposit is obvious. It is not safe to assume that because there is nothing on the contact face of the valve and seat that all is well; there should be no deposit anywhere near the valve. It not infrequently happens that the gummy stuff looks a good deal like the rough iron, but a touch with a scraper or screwdriver will show the difference.



Bad Effect of Oil on Insulation.

Because oil has a disintegrating effect not only on rubber but on cotton and fabric as well, care should be taken to see that the wiring for electric lighting and engine starting systems is well protected. If oil is permitted to remain on the wiring, the insulation will in time be so softened that the slightest chafing will cause the bare copper to be exposed and a short circuit or a leakage of curren will follow and it may be an extraordinarily difficult leak for even an expert to discover.

PERFECTS STILL TO MAKE HOME MADE MOTOR FUEL



British Device Makes 3½ Gallons of Gasolene from Four Gallons of "Crude"—How It Operates.

The high cost of gasolene, or "petrol," as it is styled in England and on the Continent, has been directly productive of several proposed substitutes; it has stimulated

HIGGINS'S HOME "GAS" STILL

the efforts of inventors to perfect some sort of a device or mechanism that will make possible the use of kerosene; it has resulted in the offer of a prize of no less than

STILL IN SECTION

$100,000 for a successful alternative fuel, and now it has been responsible for the development of a pocket-size still with which the motorist can make his own "petrol" and thus bid defiance to the oil barons. With it, it is said, any one can readily convert four gallons of crude oil into 3½ gallons of perfectly good motor fuel in two hours. Two views of the apparatus in its entirety are shown herewith, the part sectional drawing showing the construction of the device. The crude oil is placed in the lower receptacle and the burner beneath it, which may be operated with either crude oil, gasolene, kerosene or gas, then is lighted.

Thereafter the operation of the still is automatic, no further attention being required. Already, it is pointed out by the manufacturers — Wm. Higgins, Ltd., 38a Quill Lane, Putney, London, S. W.—quite a demand for the home still has sprung up and 100 a day are being disposed of. In England the price of the apparatus is £3, which is equivalent to about $15, and the American price, which includes carriage, is $20.

Where Graphite Will Help Starters.

Greater perfection of operation of those types of electric engine starters in which the gears on the electric motor shaft are slid into engagement with gearing on the periphery of the flywheel generally can be brought about by placing a small amount of graphite paste upon the motor pinion. The engagement of the gears thus will be facilitated, and their operation will be less noisy. Only a very small amount should be used, however, or it is likely to work along the shaft and get into the motor, where it might cause a short circuit; graphite is an excellent conductor of electricity and will play havoc with insulation.

Deceptive Indications of Leaky Plugs.

Leaky plugs, though scarce, can cause a lot of trouble that is very difficult to trace; they will make a motor miss at high speed, or on heavy pulls, but will permit it to run quite properly, to all intents and purposes, under ordinary conditions. The principal trouble is cracked or porous porcelains which permit the high tension current to ground without jumping the spark gaps. The only remedy is to fit new plugs that are known to be in good condition and to be careful not to crack the porcelains in tightening them in the cylinders.

Overheating that is not Chronic.

It is a mistaken idea to assume that a motor that has once overheated sufficiently to boil the water in the radiator is ever afterward particularly susceptible to the same trouble, for this is not so, provided, of course, there is nothing functionally wrong with the cooling system. One thing that would make it "steam" again would be a shortage of water in the jackets and radiator due to the previous overheating.

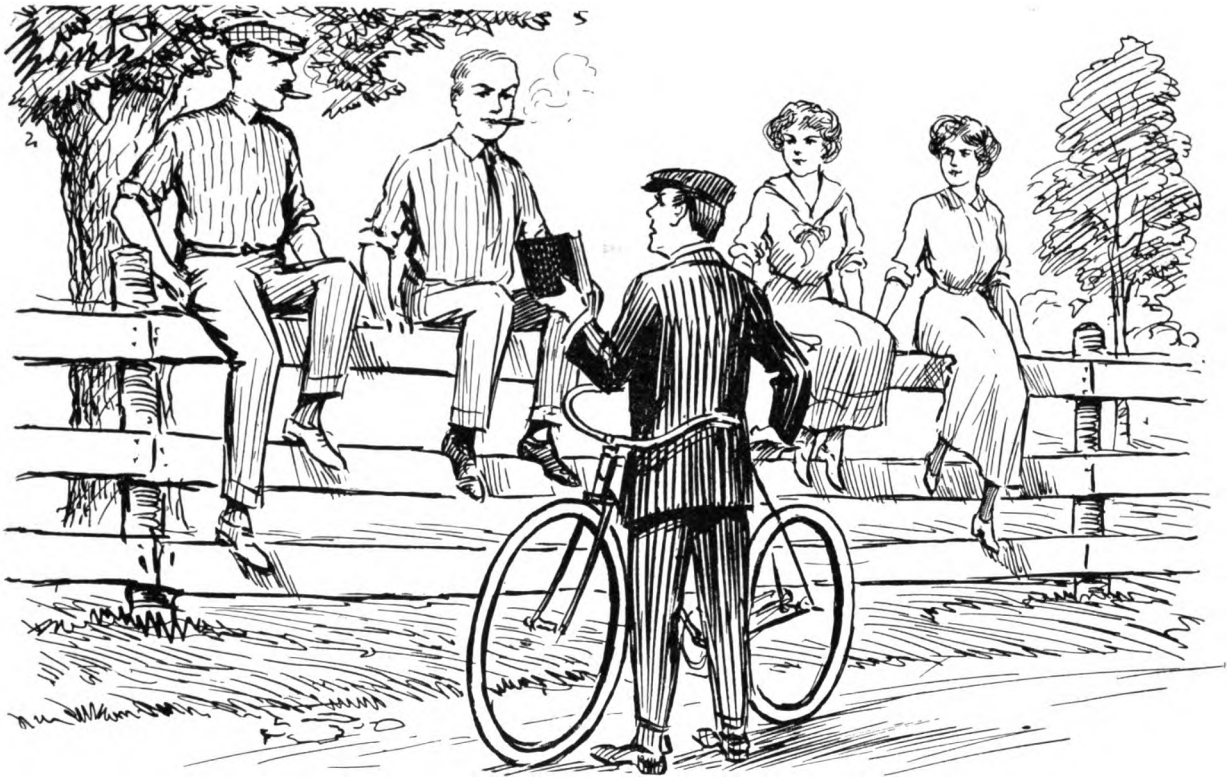
AVOIDING "GOLD BRICK" AIR IN SELLING CARS

Salesman Must Act as if He Believed in His Car and Must Carry Himself as if He Were Not Apologizing, Says Reilly—"Be Just as Good a Business Man as Your Prospect and Make Him Think So."

How Reilly did it no one was ever able to find out, but one day during their vacation at the lakeside farmhouse he succeeded in rousing the Sales Manager from his berth under the apple tree and in inducing that factory functionary to row the two men and their wives across the lake to what Reilly said was a "pretty little gorge where natural gas bubbled up in the creek and would burn if it was lighted."

The Sales Manager remembered the row he had had not long before "around the next point" and he flatly refused to row at all unless Reilly could stand on the lakeshore and point out so everyone could see it the gorge in question. Luckily, Reilly could do this and the salesman played motor again.

"You can afford to row," said Reilly. "You haven't been doing anything but sleep under that apple tree for more than a week."



The gorge proved just as Reilly said; the only disadvantage was that it was cool and abounded in flat rocks and several times it took the combined efforts of the trio to pull the Sales Manager off a cool, flat rock and make him climb the gorge. But he did climb it after a while, and when the quartet emerged at the top and looked down upon the lake and valley the Sales Manager grudgingly admitted that the tramp was partially worth while—especially since he had found a flat-topped board fence in the shade of another apple tree and was roosting there, to the discouragement of the others, who wanted to go back.

"Oh, there you go again! Can't sit still or rest a minute, can you?" he expostulated. "Why can't you sit down a few minutes? Here!" This was addressed to Reilly, at whom the Sales Manager thrust an inviting-looking cigar. Reilly yielded to temption and the four, like county fair railbirds, ranged side by side on the fence.

"Bet he's a book agent."

"Magazine solicitor."

These guesses were hazarded in order with rapidity by Reilly, the Sales Manager's wife, Mrs. Reilly and the Sales Manager as a youth appeared a quarter of a mile away upon a bicycle, just leaving a farmhouse.

"A BOOK ENTITLED——" BEGAN THE YOUTH AS HE PROCEEDED TO UNFOLD A LEARNED-BY-ROTE TALE

He had that certain appearance of being out to sell somebody something, and the guessers waited with expectancy till he pedalled up.

"Warm day," said the youth, as he dismounted and approached the quartet of railbirds.

"Hadn't noticed it," replied Reilly.

"What are you selling?" This from the Sales Manager's wife.

"A book, entitled——" began the youth, and he proceeded to unfold apologetically a learned-by-rote tale of the virtues of his piece of literature. When he was all through he asked if anybody wanted to buy one. They all said no, for they hadn't intended buying in the first place; but if they had, the I-aven't-much-confidence-in-it-myself air

Digitized by Google

of the agent would have caused whatever intention they may have had to go fluttering away. The agent apologized for having taken their time and cranked up his bicycle.

Apologetic Bearing that Kills Sales.

"Anybody'd think he was trying to gold-brick us, the way he acts," remarked Reilly, who gazed down the road to where the youth had stacked his bicycle against the front gatepost of another farmhouse.

"He acts like the last salesman who came in and said he knew you and wanted a job," jibed the Sales Manager.

"Who was that?" asked Reilly.

"Oh, I don't know; there isn't a week goes by any more that some salesman or fellow who wants a job doesn't come in and say he knows you. They all seem to think that's a recommendation."

"It is." And Reilly puffed his chest and gave his cigar an upward tilt.

"Oh, I know who you mean; he does know me, for he used to work for me," exclaimed Reilly.

"Did he? I might have hired him—how long did he work for you?"

"Let's see," said Reilly, counting on his fingers; "Six, seven, eight——"

"Eight years!" exclaimed the factory man.

"No!" almost yelled Reilly. Eight days—and that was eight too many."

"Eight years!" he continued. "I should say not! If he stayed with me eight years I wouldn't have any business."

"What ails him? He acted afraid when he called on me."

"I don't know what you call it," replied Reilly, "but he lacked something or other. He seemed to think he wasn't as good as the next man and that he ought to apologize every time he tried to sell a man a car. He had this gold-brick feeling in the back of his nut and he couldn't get over it. I tried my darndest to brace him up, but there was nothing doing."

"How'd you get him?"

Lack of Self-Confidence a Failure.

"He walked in and wanted a job and I gave it to him," said Reilly. "Then, a week later, I took it away from him. He has the same trouble that many other salesmen, or would-be salesmen, have. He didn't seem to be able to act as if he had any confidence in the thing he was selling. He couldn't brace up and act as if he was just as good a man as the man he was talking to, and he had a slouching, slinking little way with him that made it easy for a man to turn him down right at the start.

"I suspected his make-up before he had been with me two days. To start with, I wasn't favorably impressed with him when he came in to ask for the job. Instead of throwing back his shoulders and walking in as if he was somebody he—I can't say he cringed or came slinking in, but he lacked that aggressiveness which might lead a man to think he had some punch and ginger in his system. But I was able to use an extra man right then on some used cars I had in stock and was anxious to move, and I thought I'd give him a chance; he acted, anyway, as if he needed the job and he seemed glad to get it."

"Did he sell any cars?"

"Not a one. I gave him a couple of prospects that I thought would be easily landed with used cars and turned him loose, but he didn't make any more headway than you would have made coming up the gorge if we had let you have your own way. He reported back on each of them that the prospects were certain they would not buy cars this season.

Positiveness and Conviction Needed.

"I thought I'd get a line on him and find out just what he was, so I tipped off an old friend of mine, who is a sort of Mogul in a sales office in our town, and told him I was going to send this fellow down to sell him a car, just to try him out. My friend said, 'All right, send him along.' I sent him along, and after he reported no results I got in touch with my friend and asked him what ailed my salesman. 'What were you trying to do—unload a lot of junk on me?' he asked. 'Certainly not,' I said, 'that was a good car.'

"'Well, you'd never know it to look at your salesman,' he answered. The salesman—so my friend told me—half apologized for bothering the prospect, and then told him the proposition he had to offer; but all the time he was talking he didn't look the man in the eye once for more than a second at a time and he shifted around in his chair as if he felt he would be committing a crime if he succeeded in getting the prospect's money in exchange for a car. He didn't put positiveness into his sales talk, either. For instance, if he wanted to say 'Then I will give you a demonstration to-morrow?' he would say, 'Then you won't want a demonstration?'

"There are two ways of saying a thing: one smacks of postiveness and the other of negativeness; one assumes that the prospect has practically agreed to the question and the other intimates that you are giving him a chance to say 'no.' And if you haven't got the prospect far enough along to want to say 'yes' he's going to say 'no' every time. This lad killed his sale before he got it started."

"Didn't he believe in the car?"

"The son of a gun, I asked him that one day," declared Reilly. "I asked him if he believed we had a good car—a car that was worth all we asked for it. He said 'yes,' of course; what else could he say? But his 'yes' had a very funny sound to it. It lacked conviction. It wasn't convincing.

Killing the "Gold Brick" Attitude.

"I asked him, too, if he thought he was as good a man as I was—not as good a salesman, but as good a man. He said 'no.' I told him that until he got it into his head that he was just as good a man as I or any other man he never would sell cars or get anywhere else worth mentioning.

"'What do you mean?' he demanded.

"'I mean just this,' I said, 'that you can't talk to your superiors with any degree of effectiveness. Now, you are wandering around the country with the idea that you are the inferior of everyone you come in contact with, and that if they give you any time or attention they are doing you a favor. Maybe you're right and maybe you're wrong, but you have got to act under the assumption, when you go in to call on a business man, that you are a business man, too, and as good a business man as he is.

"'You haven't got to slink in as if you were going to sell him a gold brick. We don't sell that kind of thing here. We sell a car that's worth every dollar we ask for it, and every man who buys one of our cars is a customer of ours and we keep him just as long as we can. No man who buys a car of us do we have to avoid afterward; he's our friend, and if we can't sell him on that basis we don't want him to have a car. If you sold a car I'll bet you'd be afraid to meet the man on the street the day after. Your attitude's wrong. Brace up and ask yourself why you aren't just as good as the next man.'"

"Did he?"

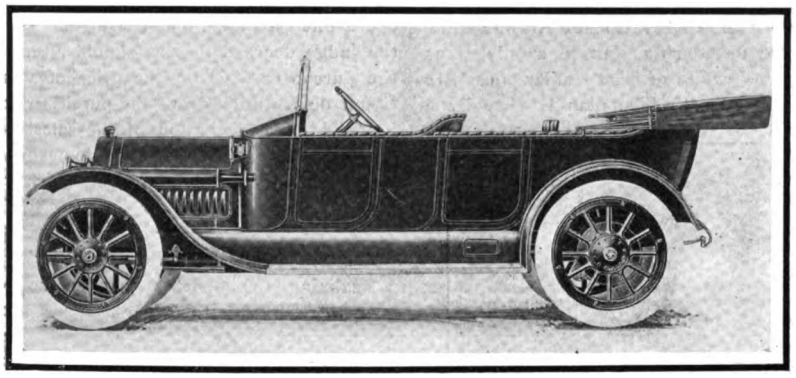
Aggressive Sales Manner Attainable.

"Oh, he said a man once told him to get up in front of a looking glass and look himself in the eye and talk to himself. He said he had tried, but that it didn't do any good, and I had to let him go."

"Do you think a man like that can be improved — educated to sell aggressively?" asked the Sales Manager.

"Certainly," replied Reilly. "I have known quite a few women who were troubled that way when they first tried to sell goods, but who——"

"Mister Reilly," said the Sales Manager's wife, with the emphasis on the "Mister," "will you please stop talking and pull my husband off that fence."



"Home, James!" And Reilly, looking threateningly at the Sales Manager, pointed to the mouth of the gorge. Whereupon the Sales Manager, groaning like a horse wallowing through a snowbank, ambled into the rocky defile—only to sit down on the first cool, flat rock.

FIRST LYONS-KNIGHT CAR HAS MANY IMPROVEMENTS

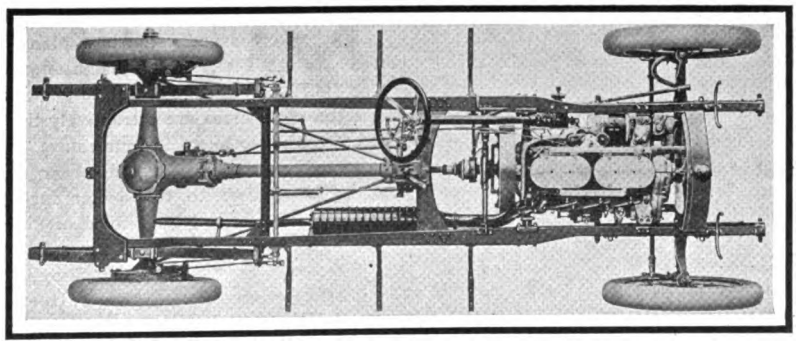
Factor of Safety Increased Throughout and New Engine Oiling System Adopted—One Chassis and Five Bodies.

Following its acquisition of the Atlas Engine Works of Indianapolis, Ind., and in March last the announcement of its intention to take up the production of complete cars as well as Knight sleeve-valve engines—the latter under one of the four American Knight licenses acquired with the Atlas business—the Lyons-Atlas Co. of Indianapolis, Ind., has made good its promise and its first car, produced under the active supervision of Harry A. Knox, who left the Atlas Motor Co. of Springfield, Mass., when it was thrown into bankruptcy to take up the management of the Lyons-Atlas Co., has made its formal appearance. As was stated would be the case at the time of Knox's withdrawal from his Springfield company, the new Lyons-Atlas car is quite like the Atlas-Knight was during its brief existence.

SIDE VIEW OF FIRST LYONS-KNIGHT TOURING CAR

COMPACT LYONS-KNIGHT MOTOR

In adopting the Knight type of sliding sleeve-valve engine, however, the Lyons-Atlas Co. has not been content to let well enough alone, so to speak. Which is to say that, while the familiar Knight principle is employed without the slightest disguise, the design of the engine has been revised to include the latest developments in both American and foreign practice. Consequently, in several minor details the Lyons-Knight engine differs from other Knight engines.



The bore and stroke of the engine are 4½ inches and 5½ inches, respectively; the piston displacement therefore is 349.9 cubic inches, and though the A. L. A. M. rating for that bore is but 32.4 horsepower, it is a pretty well established fact that Knight engines, or any other kind of engines, for that matter, have little difficulty in considerably exceeding such conservative ratings; 50 horsepower is given off at 1,200 revolutions.

The specific differences between the Lyons-Knight engine and any others are that the relative travel of the reciprocating sleeves has been increased, thus affording better sealing of the ports, and their fillets and lugs have been made larger than is usual, in order to increase the factor of safety; the walls of the sleeves, too, are slightly thicker, and thus the possibility of distortion under extreme temperature changes is practically obviated. Another point of difference is in the oiling system; splash has been eliminated, and in its place there is a positive pressure oiling system interconnected with the throttle lever in such a way that the amount of oil fed is proportionate to the power developed by the engine. Oil is fed under pressure to all the moving parts, including the pistons and sleeve parts. The oil reservoir is contained in a sub-base beneath the crankcase with an intermediate air space to prevent undue heating of the oil.

Cooling is by centrifugal pump-circulated water in conjunction with a large cellular radiator, and gas is supplied by an improved form of double jet carburetter set close to the intake ports on an exceptionally short induction pipe. Ignition is by high-tension magneto operating a dual system. Needless to add, the engine is electrically started and the car is lighted by electricity; the system used is the Northeast.

In appearance, the Lyons-Knight engine is quite like other Knight engines, of course, its exterior being free from the various parts that characterize the poppet valve motor and everything being neatly finished in black enamel and nickel. One interesting feature of design is the enclosing of the tops of the cylinders, together with the spark plugs, by means of polished aluminum caps which effectually keep out dust and dirt and protect the plugs from accidental injury.

In the transmission elements of the car, power is transmitted by means of a three-plate clutch contained within the flywheel; the central member is very thin and light and is of large diameter to afford the maximum of friction surface; it is faced with Raybestos. The change gear mechanism is of the sliding selective type providing three speeds forward and reverse, and is operated by the orthodox hand lever placed in the centre of the footboard; it is located very close to the seats and, as its travel is quite small, it offers no hindrance to either side entrance.

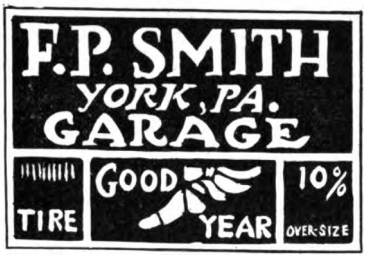
PLAN VIEW OF LYONS-KNIGHT CHASSIS SHOWING TRANSMISSION ELEMENTS

The gearset is located on the rear axle and angularity between the engine and the rear axle is compensated for by two large

Digitized by Google

Spicer universal joints. The rear axle is of the full-floating type with a special bronze housing of unusual strength to obviate the possibility of damage through collision witih rocks in the roadway. Drive is through a worm gear underhung, the road clearance being nine inches. The propeller shaft is enclosed in a substantial torque tube connected forward to a cross frame member through a large hollow ball and socket joint.

Two sets of brakes, both compensated, as a matter of course, are provided, and both are mounted on 16-inch rear wheel drums. The service brake is pedal operated and the emergency brake is operated by lever and either may be adjusted easily and quickly from the outside. The frame is a pressed steel channel section 5 x 4 with a six-inch drop at the rear and is carried on semi-elliptic and three-quarter elliptic front and rear springs, respectively. Wheels measure 37 inches in diameter and are shod with 5-inch tires carried on demountable rims; the standard tread is 56 inches and the wheelbase is 130 inches for all body types. Between the top of the worm gear casing and the frame there is a hydraulic shock absorber which reduces sidesway to the minimum and operates as an efficient rebound snubber.



Conforming to the growing tendency, the gasolene tank is placed beneath the deep skuttle, thus providing a short, direct gravity feed to the carburetter; the capacity is 22 gallons, of which two gallons are held in reserve. The steering gear, which is of the irreversible type, is mounted at the left side and is topped by an 18-inch rubber wheel; the column is braced to the dash to ensure rigidity. Shafts in the steering gear column are hardened and ground steel and all bearings are bronze bushed. Steering connections are made with bearings having hardened and ground bushings and studs.

The bodies of the Lyons-Knight cars—four- and five-passenger touring, Sedan and Berlin—have been designed for utility and with a careful eye on beauty of outline. They are constructed of sheet aluminum, which provides for lightness and strength, and are more than ordinarily roomy; the rear seat of the touring models, for instance, measures 52 inches across and the cushions are very deep and soft; standard colors are dark blue and Brewster green, with black upholstery.

Equipment includes a Golde "one-man" top made of black Pantasote, with side curtains and dust cover; built-in windshield of a special type, in which the top glass portion is wider than the lower portion and both are adjustable; Warner speedometer and clock; combination tire holds and trunk rack at the rear; robe and foot rails; cocoa mat; electric lighting and engine starting system; two-tone electric horn, and the usual complement of tools, spare parts and so forth.

Sign Scheme That Saves Expense.

Of the value of road signs to the garage proprietor there is no doubt, for it is fair to say that the garage which introduces itself to the traveler is the garage that will attract the bulk of the tourists' trade; it is a matter of simple logic. Really enduring signs, however, cost more money than many garagemen are willing to invest for even such enduring advertising, but as a means of inducing more of them to do so, the Dealers' Service Bureau of the Goodyear Tire & Rubber Co., of Akron, Ohio, just has perfected a plan to supply signs at a mere fraction of what similar ones have cost in the past. The plan is virtually a

GOODYEAR DEALER'S SIGN

co-operative buying propostion whereby all the orders for signs received by the Goodyear company are lumped and passed on to the sign maker at the same time.

Thus he is enabled to make the signs up in quantity at considerably less expense than for only a few signs. Under the old method, each dealer's order for signs was filled separately at the rate of $68.21 per 100 signs, whereas under the new plan the net cost to the dealer per 100 signs figures out at $14.79—a clear saving of 82 per cent. The signs themselves are attractively lithographed on heavy metal in four colors. The upper portion, and by far the larger portion, is given over to the dealer for his name and address and his choice of either of the two announcements, "Garage & Service Station," or "Automobile Supplies"; the lower portion, as is shown by the accompanying illustration, serves for the Goodyear company's "ad."

First Aid Stations and Signs Combined.

By way of killing two birds with one stone, municipal authorities of the township of Port Sunlight, in England, have adopted the unusual plan of combining sign posts erected for the direction of motorists and "first aid" stations in one. On each sign post at a dangerous place there is a cabinet containing a stretcher, bandages, surgical instruments, splints, medicine and other various appliances and drugs that generally are to be found in ordinary "first aid" cases.

Feminine Influence in Body Building.

It long has been known that women exert a mysterious influence that has been known to change the destinies of nations. That same influence, coupled with the vagaries of feminine fashions, is likely to alter the shapes of motor car bodies, for in the French courts a judge has ruled that it is the duty of the builder in supplying a car to take into account the fact that long plumes now are being worn on ladies' headgear and to make provision for them. Because one particular builder did not do so the judge decreed that he should return to the purchaser $200 on the price of a car. Count de Kergorlay was the purchaser and he sued for cancellation of the sales contract because the countess's plumes were injured when she rode in the car, which was a closed one.

Bronze Check for Carburetter Service.

Realizing the benefits that accrue not only to users, but to dealers, from a good service system, the Motsinger Devices Co., of Lafayette, Ind., has developed a plan whereby an agent who installs a Motsinger carburetter gives the owner a card which is exchanged at the factory for a bronze check bearing the carburetter number and date of installation. This check entitles the owner to free carburetter service at any Motsinger station for one year. As the carburetter is of simple construction, having only one adjustment and that manipulated from the dash, it is not anticipated that the service plan will cause the agents to be overrun with work.

Making It Easy for the Truck Drivers.

The State of Illinois is laying itself out to become a mecca for motor truck drivers, if there is any significance in House Bill No. 287, which recently has been passed by the legislature. The bill provides that "drivers of commercial motor trucks shall be protected by windshield and hood from dust, wind and inclement weather." Drivers of motor trucks who have had any experience with Illinois winter weather — Chicago's brand in particular—no doubt will give the bill heartfelt endorsement.

Rubber Tubing Injured by Display.

Rubber tubing and the like that has been exposed for some time in the sunlight and heat of a show window is apt to be rather the worse for the lack of protection, and is not likely to be nearly as good as rubber that has been properly protected by being kept in cool, dark places.

FANNING LIFE INTO THE APPARENTLY DEAD SALE

The Salesman Who Went—or Started—to Europe to Sell a Car—Difference Between Getting Healthy Man to Breathe and Saving Man Who Sinks for Third Time—Doing What "Couldn't Be Done."

"The only hard sales are the ones you don't get," said a dealer who likes to have as few "hard ones" as possible on his record sheet.

Some salesmen can make sales that "come easy"; others are especially adept in cutting down the margin of "the ones I didn't make." Many a salesman or dealer has gone as far as he could with a sale and when he failed to complete it has wondered if some other man could have "pushed it over." Rescuing sales which have been given up as lost may be said to require able effort, and in this connection it may be said that Cass, a sales manager, and Gray, a salesman, one of whose sales was described in Motor World last week, probably have as enviable a record as any other dealership house with "sales that were pulled from the fire."

Assigning the Difficult Case.

Cass at one time had under his direction a youthful salesman who had not attained high efficiency, and since the names Cass and Gray are not the true ones his name may be said to be Baer. One of the prospects who found his way to the list maintained by this dealership establishment was an eminent physician of the city, ranking within but one or two notches of the top in surgical circles. Baer had been assigned to sell this doctor a car and had made many trips; each time he reported little progress, but Cass sent him back again and again and again, believing that with proper salesmanship the surgeon could be placed on the owners' list.

One day Baer returned to the office to report on this prospect and said to Cass, "There's no use trying to sell Dr. Gregg a car; he's going to Europe to-morrow." Gray, the star salesman, was writing at his desk nearby and he overheard what was said; maybe he was anxious to be given this difficult task, but if so he said nothing and kept on writing, the while he could feel the cold, gray eyes of Cass burning into his back.

"Gray, did you hear what Baer said?" asked Cass.

"I heard him say something about the doctor going to Europe."

"What would you in a case like that?" asked Cass.

"If I wanted the sale bad enough and couldn't do anything else I'd go to Europe with him."

Baer greeted this with a loud guffaw.

"What are you laughing at?" demanded Cass.

"At Gray going to Europe; no doubt he'd like the trip."

"Would you like to handle this sale?" asked Cass.

"Certainly."

"All right, go ahead," directed Cass.

Gray walked to the cashier's window and asked for $100, received the amount and started out the door.

"When will I hear from you?" asked Cass.

"To-morrow morning before I start," replied Gray.

Camping on Trail of Prospect.

When Gray reached home he stopped to think what he should do: he was certain he would do something, but hadn't yet decided what. The first thing to be learned was when the surgeon was to leave town and on what train, wherefore he telephoned the physician's office.

"This is Mr. Gray, of the ——— Motor Co."

"I'm entirely too busy; I ahven't time to talk with you now," replied the physician.

"But, one minute, please," replied Gray, who was under the disadvantage that the prospect could terminate the conversation any time he wanted to by hanging up the receiver. "On your trip you will have quite a lot of time to yourself, and I would like to have you take a catalog with you. I would like to have some one give one to you when you take the train in the morning."

"I don't object to that," replied the physician.

"When do you leave?"

"At 8.10, from the Central Station, for Brandburg," naming a city a couple of hours distant.

"I thought you were going to Europe?" said Gray.

"I am," was the answer. "I perform three operations in Brandburg to-morrow; my wife joins me there, and we go on from Boston and sail from there."

Gray was at the railway station in the morning and he watched carefully to see if the physician took the train. When he made sure the prospect was aboard Gray, too, climbed on and proceeded to locate his man. As the train was pulling out of the city Gray saw the doctor leave his chair and go to the smoker, where he sat down and unfolded a newspaper. Gray had succeeded in getting the prospect in a position where he had more time to talk than had yet been the case throughout the conduct of the sale.

Sales Wedge Effectively Entered.

As the physician settled down to read Gray stepped up in front of him and was recognized.

"Where are you going?" asked the doctor.

"Brandburg."

"Is that so? I'm going there, too."

"Yes, I knew it," replied Gray. "You're going to perform three operations there to-day and then you're going on to Boston."

"Do you mean to say that you took this trip just to see me?" asked the physician.

"Yes, sir."

"You needn't have done it," replied the prospect. "But it's good business—good business," he added.

Gray succeeded in engaging the doctor in conversation and talked car under very advantageous conditions until they reached Brandburg, where they left the train, and by this time were on such terms that the physician, though he had not been brought to the buying point, was becoming favorably disposed. After lunch the surgeon asked Gray if he was interested in surgery, and the salesman truthfully answered that he was and told the doctor of several operations he had seen.

What Diplomatic Strategy Accomplished.

"Maybe you'd like to come over to the hospital and see some of my mechanical work?" he said.

Gray hastened to accept the invitation and, aside from being with his prospect, saw three of the best pieces of surgical work it is the good fortune of laymen to witness; also, the price of the afternoon's work would buy several cars. After the operation, the doctor invited Gray to take

Digitized by Google

lunch with him, and over the cigars and coffee the professional man asked Gray how far he would go before he would go back without an order.

"Well," slowly replied the salesman, "it isn't so far to Boston and, of course, if all the passage on the ship was engaged I could follow on the next one."

On the train Gray had informed the physician that his object in making the trip was to secure a little of the doctor's time when he was not overwhelmed with work, since he realized that so eminent a surgeon was an extremely busy man.

Argument that Closed the Sale.

"You are going to Europe," argued Gray, in substance. "You will want to enjoy your trip. If you do not buy a car before you go you will have it on your mind all the time you are gone, as one of the trivial things which must be attended to when you get back. There is no question but that you need a car, and if you come back without having placed your order you are immediately going to find a vast accumulation of important work into which you must plunge, and all the time you will have on your mind this detail and will have no time to attend to it.

"The chances are you will be so busy you will continue to use your old car; you will continue to drive around the city in it and it is now nothing much more than junk and is depreciating in value rapidly. Jolting around that way is injurious to your spine, as you are well aware, and the arrangement will be very unsatisfactory to you. Now—if you place an order before you go and will wire me when you land in New York or Boston, I will have your new car meet you at the railway station and the only worry you will have will be your gasolene bills. Also, during your absence I can dispose of your old car for you and, I believe, get at least $200 more for it by this method and at the present time than I can after your return."

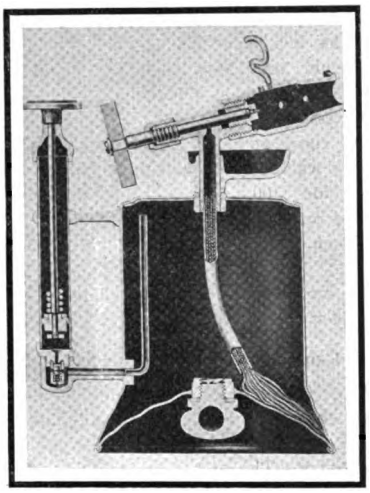
"That sounds logical," was the physician's comment.

"I suppose your happiness will be complete if I give you an order, won't it?" asked the doctor in a good-natured way.

"No, only 50 per cent. complete," answered Gray.

"How so?"

"Because," and Gray smiled, "the other 50 per cent. will be in assuring your happiness and content of mind when you return."



The doctor laughed. "All right; what do you want me to do?"

"Sign the order," said Gray, "and give me $1,000 deposit. And one thing more," he added; "instruct your secretary that when the wire comes that you have reached New York I am to get the balance on the car, for I can't roll it off the floor without the money; that's a company regulation which I must observe. In that way you will have your new car waiting for you when you leave the train."

The physician did as requested and Gray went back to town. In the morning when Cass arrived at his office the order and deposit lay on his desk.

Westinghouse Develops Improved Torch.

By way of increasing the field of usefulness of the gasolene blow torch, which is put to so many uses in the average garage, the Westinghouse Electric & Mfg. Co., of

WESTINGHOUSE GASOLENE TORCH

market a new torch in which a number of Pittsburgh, Pa., just has placed on the improvements and refinements have been made; it is styled the Universal torch. To facilitate lighting in windy weather, the drip cup is made rather larger than usual and the burner is more than ordinarily substantial, so that it will retain its heat and prove effective in cold weather or in a brisk breeze. Another excellent feature is that the burner is self-cleaning; the hole is cleaned automatically by the movement of the needle, thus obviating the necessity for picking at it and endangering the valve seat; this seat, by the way, is a separate replaceable plug. The valve handle is made of fiber which is a non-conducter of heat, and the material is calculated to withstand almost any amount of abuse without cracking. The tank of the torch, as is made plain by the sectional picture, is of unusually heavy metal and therefore will not dent easily; it is practically impossible to puncture it. To ensure the perfect seating of the pump valve, the plunger operates in a guide and the whole mechanism can be taken apart quickly and easily for repairs. The torch is supplied in both pint and quart sizes, the illustrations showing the larger size.

Valve Lifts as Sources of Trouble.

Anything that tends to push a valve to one side, or lift it by applying force in any way except centrally, is liable to cause unequal and abnormal wear of both stem and seating. For this reason the end of the stem and the top of the lifter or tappet should be true and square and make perfectly even contact, which cannot be done if either is unevenly worn. This is a little matter that often has made trouble that has been ascribed to other causes. In one instance, a motor manufacturer went to the trouble of enlarging the stems of his valves and using larger guides, because there was excessive wear of the stems, whereas all that really was needed was better lifter construction—a fact that was discovered later on, after the trouble had been taken and the unnecessary expenditure made.

To Keep the Finger Nails Clean.

When working about a car on jobs that necessitate a good deal of dabbling in dirty oil, the stuff gets under the finger nails and is extremely difficult to dislodge. Prevention is better than cure, however, and if a little soap is scratched off a cake and worked under the nails before beginning work the oil will not get far and its removal will be an easy matter. A very effective method of getting oil under the nails so that it is almost impossible to get it out is to wash the hands in kerosene while they are oily. The kerosene carries the oil further under the nails.

Common Cause of Fan Breakage.

A cause of fan breakage that is rather common is the running of the fan when it is considerably out of balance, which results in setting up stresses that the sheet metal often will not withstand. If a fan does not trun true it should be made to do so by bending back into position the blade that has been bent, or bringing the circumferential wire or band into shape if it has been distorted. Often a fast-running fan, if much out of balance, will set up a noticeable vibration of its own, which is hard on the fan bearings as well as the fan itself.

Wrongful Use of Steering Wheel.

The not uncommon habit that some drivers have of turning the steering wheel by short, quick jerks is not conducive either to good driving or to the welfare of the steering gear. A steady, continuous wheel movement is not difficult to acquire, with a little practice, and, besides, it looks a good deal better than the spasmodic twitching that so often is seen.

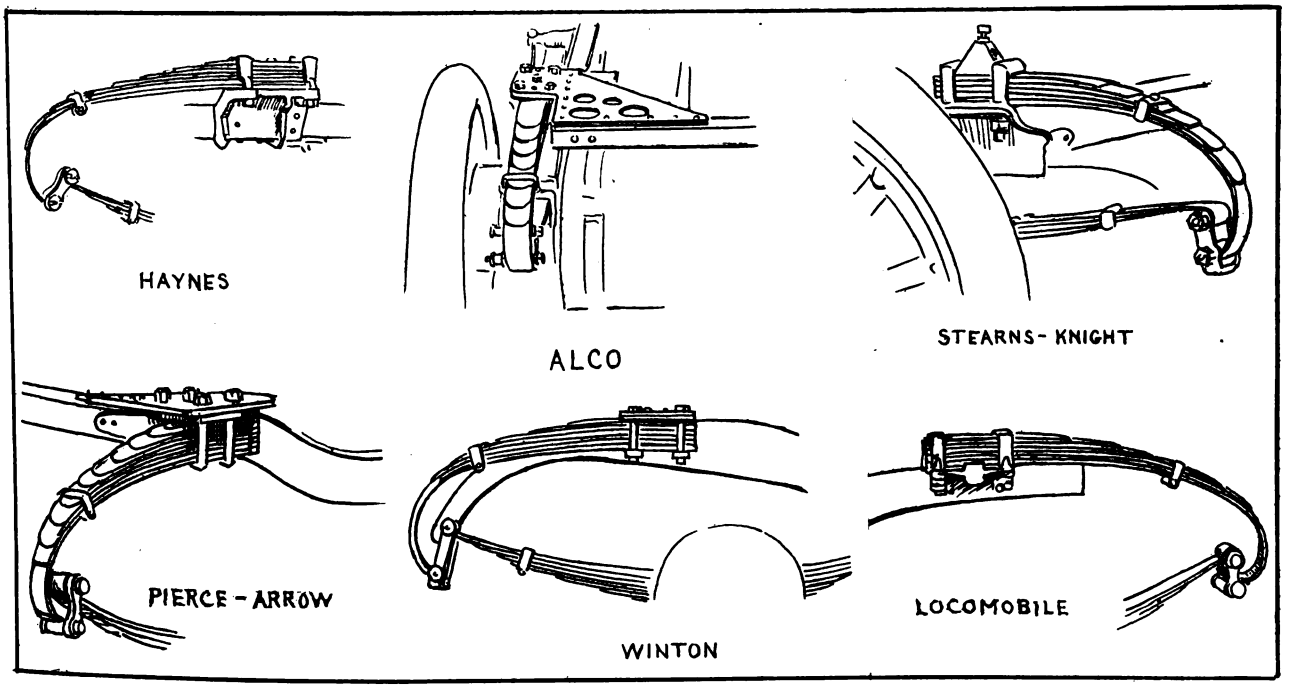
FASTENINGS AND FIXTURES FOR REAR SPRINGS



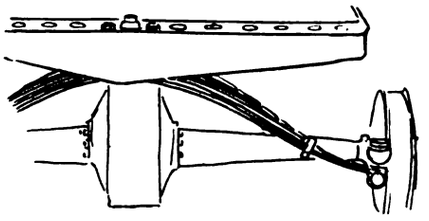
Various Methods of Attachment Necessitated by Various Methods of Springing —Detail Differences Due to Individual Ideas—Hangers That Serve Double and Triple Purposes; Others That Serve But One.

There are not a few parts of the automobile that no one ever seems to talk about. Not that they are unimportant, or that they do not bear a fair share of the work of keeping the car intact, whether that work be of the active order or is merely passive, but because for one thing they are more or less out of sight and consequently out of mind, and for another they are among the parts that never seem to give any one any trouble and so are not open to much comment or criticism. No one seems to have any difficulty in making them quite good enough to stand up, no matter what may befall the rest of the car, so no one ever has any particular reason to examine them; nine car owners out of ten don't know what they look like on their own cars, and when the machine finally becomes so decrepit that it no longer is of any use as an automobile, these unassuming components probably go to the scrap heap in just about as good condition as when they were built into the brand new car.

Hidden under the fenders and behind the rear wheels and coming well within the class of parts that work unseen—they have no reason to blush, even if they could—are the varied devices that serve to secure the rear springs to the frame of the car—that is to say, whatever part of the rear spring is permanently and rigidly anchored. There is such a wide variety of forms of springs, of combinations and arrangements of different forms of springs, of frame shapes that influence spring form and spring support, and so on, that it is obvious that there must be no little variety in the spring anchorages. Starting with the springs themselves, there are half-elliptic, three-quarter elliptic, seven-eighths elliptic and full elliptic, besides single cross or transverse springs, three-platform springs and cantilevers. Each involves some special form of anchorage because of its particular form and the way in which it distributes its stresses, and besides this there are the individual variations due to frame construction, to the personal ideas of designers and to the method of transmitting driving stresses—that is, whether the drive from the chassis to the body is through the springs and, consequently, through the spring fastenings, or through torque or radius tubes or rods.

There are not a few types of rear spring suspensions in which there is no rigid frame anchorage for the spring, strictly speaking, every point of attachment being either pivoted or shackled. Usually, however, there is at least one rigid fastening, which may be either on the frame or on the axle, according to the design and construction of the suspension, and in some cases there are rigid fastenings at both points. By a rigid fastening is meant one which permits no relative movement between the spring and the member to which it is attached. Pivots, shackles and the like permit relative movement, while ordinary clips do not.

A form of rear-end support for the rear spring that at one time was quite commonly used is that in which the rear end of the side frame is extended rearwardly to form a horn carrying an eye for the rear shackle bolt; a variation of this is the curved horn or gooseneck answering the same purpose. With the increasing employment of three-quarter elliptic springs, however, this ar-

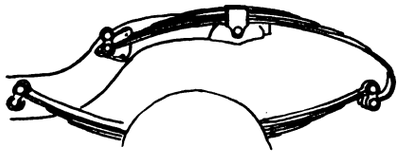


VARIETY IN THREE-QUARTER ELLIPTIC SUSPENSIONS AND IN METHODS OF HANGING SPRINGS

Digitized by Google

rangement is becoming far less common that it was. The upper quarter of a three-quarter elliptic spring is very often clipped or bolted to the frame through the intermediary of a bracket or its equivalent, the general effect, when seen from the side, being that of an extended frame.

Bracketing Three-quarter Elliptics.

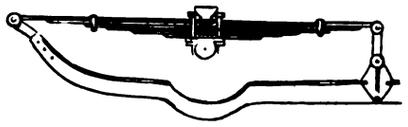


In the case of the Winton car, in which the rear springs are three-quarter elliptic the rear ends of the main frames are extended backward, but not to carry the springs;

HUPMOBILE CONSTRUCTION

they carry between them the big rectangular gasolene tank. The stub ends of the upper spring members are clipped under the extending ends of a transverse plate riveted to the top of the frame at the rear end, the plate not only serving to hold the springs but also to stiffen and brace the rear of the frame. Two clips are employed, spaced well apart to withstand the leverage of the always prying springs. Incidentally, there is no bolt, and consequently no weakening bolt-hole, through the center of the spring, the leaves being held in their proper relative positions by "nibs" stamped in the leaves.

The principle of the Alco arrangement is similar to that of the Winton. Instead of extending clear across the frame, however, the top plates each extend a trifle less than half-way across; forming, virtually, big, strong corner gusset plates with spring seats in the under sides of the projecting lugs. Holes of considerable size serve to remove quite a little metal where it is of

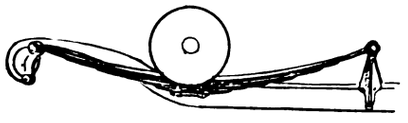


PANHARD SEVEN-EIGHTHS

no service, materially lightening the construction at this point.

The extended gusset-plate also is embraced in the rear construction of the Pierce-Arrow, and the springs are clipped under the lugs, too; but the plates which form the brackets are comparatively short, being merely gusset plates of ordinary size. As they are not depended upon very largely as strengthening members of the frame, the frame itself at the rear end is made strong and heavy enough to require no great auxiliary bracing.

Rear Frames That Do Double Duty.

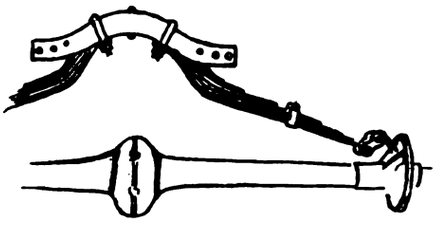


The Locomobile is typical of another class of three-quarter elliptic rear spring attachment. While the springs are clipped to brackets on the frames, the brackets are just plain spring brackets and nothing else; they are heavy, forged right-angle brackets riveted to the frames so as to form little shelves that are about flush with the frame tops. The springs are clipped to the tops of the brackets, and not to the under sides as in the style of construction already referred to. Except for the fact that the brackets are carried a little higher with relation to the frames to which they are at-

NORWALK UNDERSLUNG

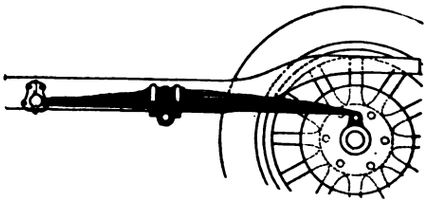
tached, the same construction is employed in the Haynes car; the brackets are exceptionally heavy forgings, ribbed to afford ample stiffness.

A different method of carrying out the same general scheme is embodied in the Stearns-Knight; the illustration shows the arrangement much more clearly than it could be explained by words alone. The rear member of the frame is heavy, deep and of box section. Its laterally extended ends form the seats for the springs, which are bolted on top. The reason for the un-



AMERICAN CONSTRUCTION

usual dimensions of this cross frame will be apparent when it is seen that in addition to acting as an important part of the car frame and supporting the springs, it carries the weight of the gasolene tank which, as the tank is of large capacity, is no small matter.



Lowering Bodies by Raising Springs.

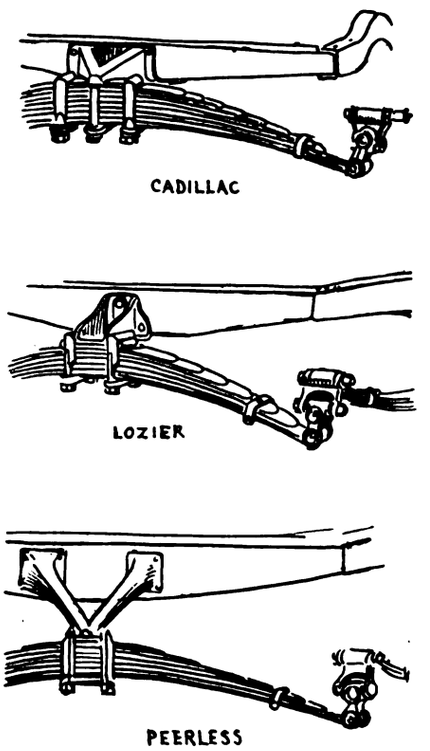
There are very good reasons for the spring positions permitted by the arrangements typified in the six cars referred to. Granting the desirability of having the body of the car placed as low as possible without involving offsetting disadvantages, it is clear that the use of three-quarter elliptic springs placed under the frame would bring about an increase of body height that would be most unwelcome. Hence the positioning of the upper spring fastenings above the lower faces of the frames. In order to illustrate the importance of this factor, it may be said that it is possible to get the body lower by from two to five inches by placing the springs above or alongside the frames than below them. Furthermore, the wide spacing of the springs permitted by the offset position brings the weight close to the wheels, in which position it is best carried by the axle, and not only distributes the weight to the best advantage from a stress-resisting point of view, but affords maximum lateral stability of the body.

FORD REAR AXLE

A type of rear spring which is neither three-quarter elliptic nor full elliptic, but is just half-way between the two—that is to say, seven-eighths elliptic—is employed in the Panhard light cars, the heavier Panhards, incidentally, being fitted with three-quarter elliptics in the rear, because the makers consider them better adapted to heavy machines. Clearly this type of spring calls for special suspension and anchorage, which is provided by making the point of attachment to the axle the only rigid fastening; the front ends of both upper and lower spring members are shackled to the frame, the "kick-up" of which lends itself particularly well to the arrangement, while the upper member is pivoted to the frame at a point somewhat less than half its length from the front end. The rear ends of the spring members are shackled together in the usual way, the upper member being scrolled to bring it under the

KING CANTILEVER SPRING

lower member. It will be observed, in this connection, that it is the almost invariable practice where three-quarter elliptic springs are employed to scroll the rear end of the upper member so as to permit its being hung below the lower member and connected by a shackle, this arrangement apparently permitting greater freedom of action and a little lower hanging, as well as a greater effective length of active steel within a given over-all length.



Digitized by Google

In the platform type of rear spring suspension, which provides a three-point support for the rear of the frame, it is usual to pivot the front ends of the side springs, shackle their rear ends to the ends of the cross spring and rigidly attach the middle of the cross spring to a bracket projecting from the rear cross member of the frame; all the springs are semi-elliptics. There is but little opportunity for variation in platform spring suspensions and apart from minor details they are much alike. It may be noted that with the side springs in the usual position outside the main frames and the rear spring back of the rear frame—that is, with the entire spring system outside of the car framing—there is no difficulty in getting the body as low as the axle height will permit. The Peerless, Lozier and Cadillac cars are prominent among the machines employing this form of rear suspension, and the easy riding qualities of these machines leaves no question as to the efficiency of a well-designed platform system.

Rear Suspensions That Are "Different."

A form of spring suspension that is different from all others and is a law unto itself is that in which a single rear spring on each side is employed, with the rear end shackled to the rear axle, the front end pivoted to the car frame and the middle also pivoted to the frame, so that no part of the spring is fixed and every inch of it is free to yield all the elasticity it possesses. This system is best known as the Lanchester system, and is used in England by the car of that name as well as by the King in this country, and by the Edwards-Knight. Owing to the peculiar method of hanging the spring the forces acting upon it are applied in the reverse of the usual direction, and so the spring is reversed—that is to say, the short leaves are on top and the long main leaf on the bottom. These springs possess a peculiar action of their own that does much to mitigate the discomfort that so often is the result riding in the rear seat of a car, especially if the car is lightly loaded.

For small cars of light weight there has been evolved a spring suspension system that is as admirable for its simplicity and strength as for its really easy riding qualities—the single long cross spring with its ends shackled to the axle close to the wheels, where the weight best can be supported, and the middle rigidly bolted to the frame. The Ford and the Hupmobile present excellent examples of the single cross-spring system and are in agreement as to the general application of the principle, though they differ in their details. In the Ford the rear cross member of the frame has a deep upward curve in the middle, corresponding with an arch formed in the middle of the spring; the arch in the spring fits into the channel of the curved frame, where it is securely held by a pair of clips, while the ends are shackled to brackets formed in the axle casing very close indeed to the wheels. This wide spacing of the spring shackles and the consequent light loading of the middle of the axle is in no small degree responsible for the fact that a very light axle can be used without undue strain. In the case of the Hupmobile the spring is carried well back of the axle, a pair of rearwardly extending brackets serving as connecting points for the end shackles, the middle of the rear cross frame coming directly over the spring, to which

THREE TYPES OF PLATFORM SPRINGS

it is bolted. The frame of the car, of course, projects further to the rear than that of the Ford.

Hanging Springs in Underhung Cars.

In the underslung car, in which the frame hangs under the axles, while in some cases the springs also are below the axles and in other cases above, the springs are semi-elliptic or practically flat. In the American and the Regal cars the springs are slightly curved and, together with the frames, are below the axles. In the Norwalk the springs are normally flat and are above the axle. A further difference is that in the American and Regal the springs are shackled at both ends, while in the Norwalk only the front end is shackled, the rear end being pivoted to the upturned rear end of the frame. In all three there is a deep drop in the frame just under the rear axle, giving ample clearance for relative movement between frame and axle without bumping.

It goes without saying that the foregoing does not by any means cover all the variations in rear spring attaching methods, for their number is legion and the opportunities for detail differences are almost unlimitted. They are prominent and typical examples, however, and serve to convey an idea of current practice in this little thought-of but extremely important constructional detail.

Method of Aligning Piston-Pin Bushings.

Accuracy of alignment of the working parts of a gasolene motor is of such vital importance that manufacturers are at great pains to avoid errors, and not a few ingenious methods of testing have been devised. Among them is a simple and effective one that is employed in a foreign factory for determining the alignment of the piston-pin bushings in the upper ends of connecting rods. After the big ends have been finished and scraped to their crankpins, they ase bolted up in place on the crankshaft with the upper bushings in a straight line.

An accurately finished steel shaft, fitting the bushings without play, is run through the holes, passing through all four—that is, if the rods are in perfect alignment. Obviously, if there is any error the shaft will stick at the rod that is off, and the error can be searched out and corrected. This test will reveal a twist or other deformation of the rod, as well as lack of parallelism of the big and little end bores, and will also show up a rod that is too long or too short, by refusing to pass smoothly through.

Graphite to Assist Valve Grinding.

A practice that is said by some repairmen to be beneficial is that of putting a sort of final polish on valves, after grinding, with graphite. After the grinding has been completed and all the oil and grinding compound thoroughly washed off, the valve seat is sprinkled well with dry graphite and the valve is worked on its seat just as in grinding. The result is said to be that the surfaces resist wear longer and retain their tightness better than without the graphite finish.

Short Circuit from Graphite Brushes.

In electric motors or generators in which graphite brushes are employed particular care should be taken to keep the accumulation of brush-dust wiped away, for as graphite is a good conductor of electricity it is possible for a ground or a short-circuit to form with the aid of the dust and, perhaps, a little moist oil.

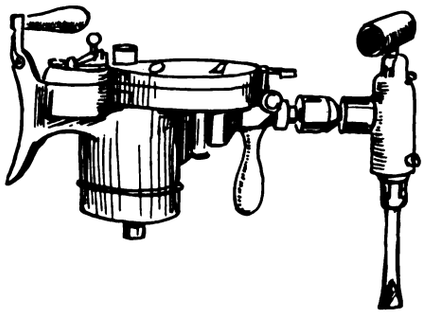
RECENT DEVELOPMENTS in ACCESSORIES

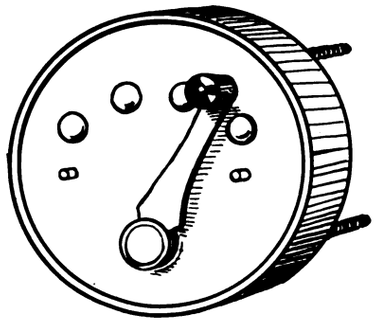
Light-Dimming Device from Toledo.

Now that the law has stepped in and had its say with regard to the quantity and quality of the light projected by the lamps of automobiles, there has been no little activity among those who make lamps, as well as those who make specialties, with a view to providing ways and means for keeping the light within bounds when within the jurisdiction of the law. One concern that has given this matter serious thought is the Suburban Lighting & Gas Engine Co., of Toledo, Ohio, which just has brought out a dimmer, the general appearance of which is shown in the accompanying illustration. The relation of the dimmer to the lamps is precisely the same as the relation of the throttle to the motor, which is as much as to say that it controls the power of the lights. By turning the little lever of the "Dimit," as the device is called, the supply of current to the lamps is increased or decreased at will and the amount of light varied in proportion.



A feature of the "Dimit," which is not common to most rheostats, is that it does not waste the current that does not go to the lamps, but acts as a true throttle in preventing its discharge from the source of current. In the case of a storage battery system this is a matter of no small importance. The makers state that in a test the "Dimit," in cutting down the power of a set of lamps, cut the consumption from 8 amperes to 2 amperes, and still the lamps were sufficiently bright to comply with legal requirements.

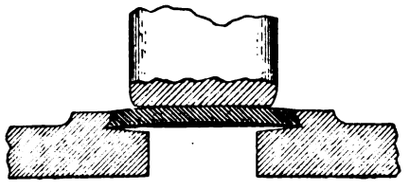
The device acts as a check to currents of excessive voltage, and while applicable to all cars, is especially adapted for use on Ford cards, where the flywheel generator produces a current of high potential when the motor races and is liable to burn out lamps taking dynamo current. The device, which retails for $2.50, is installed by merely wiring it in series with the lamp or lamps to be controlled and will handle from three to five lamps at once.



Plugs that Prevent Cylinder Cracking.

When water left in the jacket of a gasolene motor cylinder freezes, it expands with tremendous force, but the amount of expansion is very small. Therefore, any method that will provide a little extra room for expansion often will save the jacket from cracking or bursting.

The salvation of the jackets under these conditions is the purpose of the plugging system evolved by Welch Bros., of Pontiac, Mich., whose idea is to put into the jacket a plug that is more than strong enough to hold all ordinary pressures, but will give sufficiently to prevent disaster in case of freezing. The accompanying illustration tells the story. A hole drilled in the wall of the jacket is countersunk and a specially made, saucer-shaped disk of soft steel is expanded into the opening by driving with a hand punch until the edges of the disk are pressed hard against the edges of the countersink. The plug holds perfectly until abnormal pressure is brought to bear, when it is pushed out of place sufficiently to afford relief.



TEMCO ELECTRIC DRILL

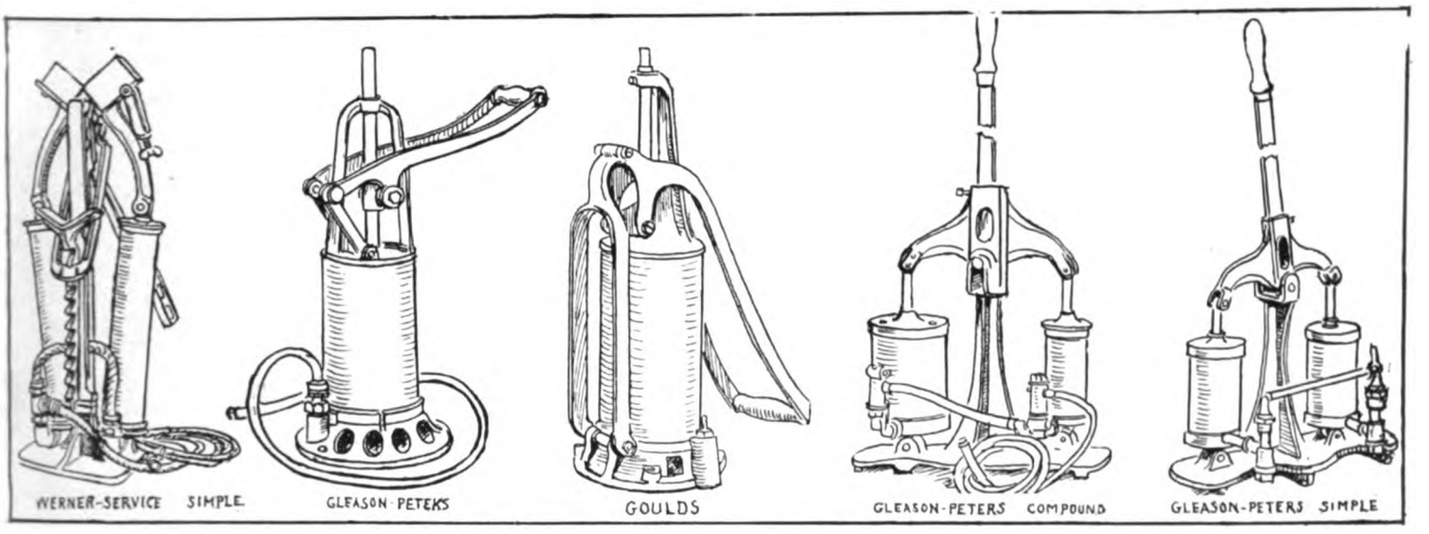
"DIMIT" LIGHT REGULATOR

WELCH EXPANSION PLUG

In making regular use of these plugs the drilling process can be eliminated by coring the holes in the foundry and casting sheet metal grommets into them, thus forming seats for the plugs and obviating further work. The plugs and grommets are made in three sizes, ⅞ inch, 1 inch and 1⅛ inch, and are so cheap that the expense of using them can be practically ignored. Smaller sizes are also made for stopping sand holes, etc., and also brass and aluminum plugs for special work.

Tool that Renders Drilling Easier.

Electricity has come to the aid of the automobile repairman in many ways, and has been instrumental in relieving him of many of the jobs that are generally designated as "mean." Not the least among the despised tasks is the drilling of holes in out-of-the-way places, where holes must be drilled with a hand-operated tool, often at the cost of considerable time, temper and knuckle-bark. Among the more recently developed tools designed to simplify such work is the electric motor hand drill manufactured by the Temco Electric Motor Co., of Sugar street, Leipsic, Ohio, which, though of small size, as the accompanying illustration shows, and weighing but 11 pounds, has a powerful little motor and reduction gearing, all enclosed in a tight casing.



The little machine will drill holes in steel up to ⅜ inch diameter, will run a 3/16 tap into cast iron and, by means of a quick-attachable emery wheel, will grind tools anywhere in the shop or do any work that a small emery wheel can do, and do it in places that would be inaccessible to the ordinary grinder. Further, by using the valve-grinding attachment, which is inserted in the chuck, valves can be ground with practically no physical labor; the method of using the valve attachment is shown in the illustration. The valve is not rotated, but is oscillated ⅜ of a turn at a time, just as if the work was being done by hand, and so the danger of cutting grooves in the seat and valve is avoided. The weight of the tool is sufficient to maintain the requisite pressure to do the work properly. Current is taken from any lamp socket that may be handy, the usual flexible cable being employed as a conductor. The tool is made for either alternating or direct current.

REDUCING THE BURDEN OF TIRE INFLATION

Hand-Operated Garage Inflators That Substitute Leverage for Muscle—Some Simple, Compound and Double-Acting Compressors and How They Operate—Requisites of the Ideal Pump for Hard and Continuous Service.

Yachting—or motor boating—and automobiling are akin in at least one respect. Both sports require periodic use of a pump, one of them being a bilge pump, of course, to clear the hull of the drink that seeps in through the seams, and the other being the time-honored tire pump. Ever since Dunlop gained elusive fame by the perfection of his pneumatic tire, an air pump has formed a very prominent part of every motorist's kit for, as was made plain in Motor World last week, air has a disconcerting proclivity to "ooze" through the minute interstices in rubber tubes, and it must be replaced. To replace it, as every one knows, requires either muscular effort or that mental effort which precedes the operation of a motor-driven pump with which a great many modern cars now are equipped.

FIVE DIFFERENT TYPES OF POWERFUL HAND-OPERATED TIRE INFLATORS

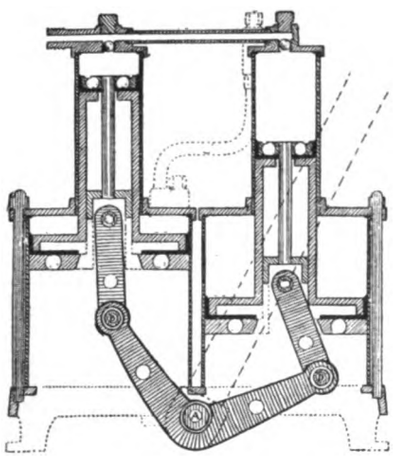
Bringing Work to the Garage Door.

The almost universal use of demountable rims and detachable wire wheels has obviated the necessity for much of the road work that is disguised by the term tire inflation, for punctures or blow-outs now mean merely the substitution of a rim or a wheel carrying a fully inflated tire. But the necessity for a pump still remains; its application has merely been transferred from some roadside to the garage at home, where most of the tire inflation is done anyway. And where no power driven pump is available, nothing remains but an application of good old "elbow grease."

All of which was appreciated by Billy Rea, who, as was told three weeks ago in Motor World, equipped his garage with a small compressor and thereby gained prestige and custom. He knew that every motorist must at some time or another inflate his tires; and by putting two and two together he figured that to attract motorists to his garage with the aid of "free air," was pretty good business; and it was, too. He had power, of course, and therefore he had no particular difficulty in "hooking up" a small compressor. If he had had no power—as indicated by a humming electric motor or a chugging gas engines—it is altogether likely that he would have put in one of the various portable outfits illustrated and described in Motor World last week, for his shop is electrically lighted. Having no electric light, it is probable that he would have purchased a really first-class hand-operated pump, and in seeking to select one he would have found very nearly as much variety as he found in power driven outfits.

It is altogether likely that a great many garage proprietors have overlooked the opportunities that demountable rims and detachable wire wheels have thrown in their path. They have made it possible for him to attract trade in a way that was not possible a year or so ago. They have brought work to his shop that heretofore was done on the road, and his opportunity for bettering himself consists in facilitating that work. Where it cannot be done with the aid of a power air compressor of some sort, there remains the large capacity hand-operated pump as a solution of the problem; without casting any reflection on those who really are industrious and who are not prone to shirk their work, chauffeurs as a rule are just a little bit lazy; they do not like to pump up big tires any more than do owners, and they will take to the garage that furnishes them "free air" as easily as a duck takes to water; which, briefly, constitutes the wide-awake garage owner's opportunity.

Shortcomings of Ordinary Pumps.

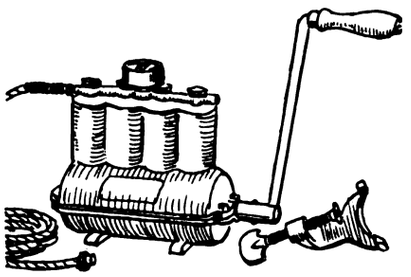


It is a lamentable fact, to which more than one person can bear witness, that the average garage pump furnished for the use of patrons is a sad failure; either it is no better than the small pump furnished as part of the car's equipment, or it is out of order, or both. Hence, reading by the lesson, substantial construction and large capacity are two of the prime requisites for a garage pump that is to be used by every one indiscriminately. The third requisite is easy action; the pump must perform its work quickly and with the minimum exer-

Digitized by Google

tion on the part of the operator; as minor requisites, it should be operable by one person—another should not be needed to hold the pump or the air connection or anything else—and it should be so mounted that its operation is not painful. Pumps that are too near the floor cause backaches and are not calculated to induce good nature, regardless of their other excellent features.

Several Varieties of Pumps Made Plain.

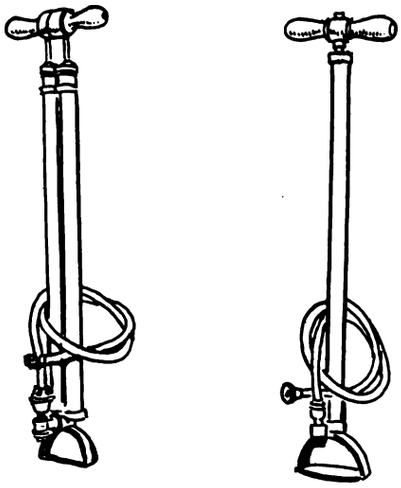


Broadly, garage pumps can be divided into two classes—namely, simple and compound; a further classification divides each of these types into single-acting and double-acting. In the simple pump, which, as its name implies, is the simplest of them all, air is forced into the tire only on the downward stroke of the piston, the whole pump consisting of nothing more than the piston

GLOBE COMPOUND DOUBLE-ACTING

and the cylinder. In the compound pump there are two cylinders—low and high pressure—and the air is transferred from the low pressure cylinder to the high pressure cylinder, and then to the tire. Single-acting pumps force air into the tire only on one stroke—either up or down, though it is usually down — whereas double-acting pumps operate on both strokes. These are the classifications that apply broadly to all air compressors, whether hand or power operated; incidentally, simple pumps are styled single-stage pumps and compound pumps are styled double- and sometimes triple- or quadruple-stage pumps, according to the number of cylinders the air passes through before it finally reaches the tire. For ordinary garage use, however, it is very seldom that either triple- or quadruple-stage pumps are used; there is no necessity for them, because they are used only for very high pressures.

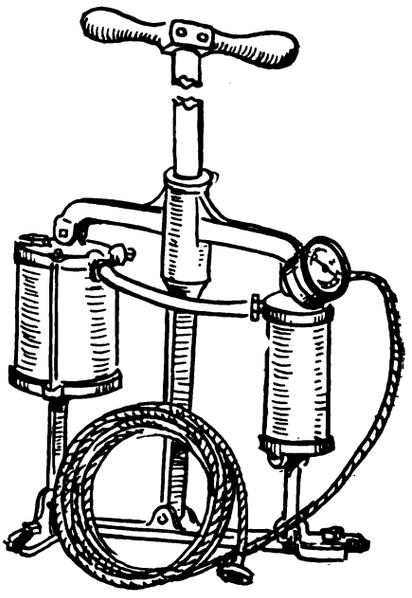
The cheapest kind of pump to manufacture and to sell is the simple pump, of course, which accounts in a measure for its widespread use. It consists of nothing more complicated than a brass cylinder and a plunger; there are no valves and there is absolutely nothing to get out of order, barring only the cup leather washer on the piston, which will remain in perfect condition indefinitely if it is treated with a little oil once in a while. Among a whole lot of other manufacturers, the Cox Brass Mfg.



DIMINUTIVE PEERLESS PUMP

Co., of Albany, N. Y., makes pumps of this style, one of them being illustrated in the accompanying sketch.

Obtaining Leverage by Decreasing Bore.



The leverage in the Cox pump, or in any other pump of the same kind, is long; which is to say, the work required to obtain pressure is spread out over a comparatively long period; in order to obtain ease of action, the pump barrel is made comparatively small—1¼ inches in the case of the Cox pump—and the travel of the piston is long. In this simple way the leverage is increased. If the capacity of the pump were

COX COMPOUND AND SIMPLE

increased by increasing the size of the barrel it would be well-nigh impossible by human exertion to force the piston to the bottom of the cylinder against pressure. The shape of pumps of the kind has one advantage: It makes them fairly easy to reach. It is not necessary to break one's back to operate them with the base resting on the floor.

To increase the capacity of a pump implies either increasing the diameter of the cylinder of the length of the stroke, or both, and as increasing the stroke is out of the question, nothing remains but to increase the diameter of the cylinder. Increasing capacity, of course, increases the power required to operate the pump and to obtain the power the simplest method is to increase the leverage. This is what has been done in both the Goulds pump, which is made by the Goulds Mfg. Co., of Seneca Falls, N. Y., and in the pump made by the Gleason-Peters Air Pump Co., of Brooklyn, N. Y. In material aspects the two pumps are not unlike each other, though the method of obtaining the necessary leverage is quite different, as is made plain by the

BINKS COMPOUND INFLATOR

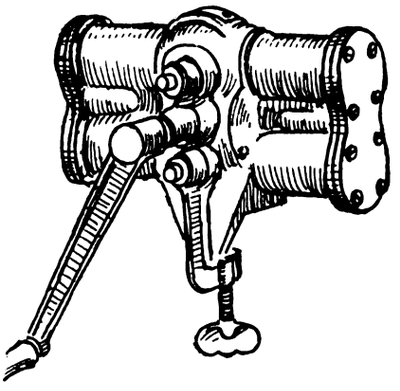
pictures. In the Goulds pump, the cylinder and base are cast integral, whereas in the Gleason-Peters, the cylinder is formed of heavy seamless brass tubing and the base is a separatae casting of bronze; the cylinder of the latter measures 3¼ x 6¼, giving a displacement of 36 cubic inches of air per stroke, and the measurements of the Goulds are 3¼ x 5½, bore and stroke. The approximate weight of the Goulds is 16 pounds and of the Gleason-Peters 11 pounds; with either, pressures up to 150 pounds can be obtained quite easily.

Permitting Operators to Stand Upright.

For the man who prefers to stand upright when he inflates his tires, there are several styles of simple and compound pumps available, not the least interesting of which is the Werner-Service "Jackpump," as it is styled by its manufacturers, the Werner-Service Mfg. Co., of Jersey City, N. J.; in its simplest aspect, it is a clever combination of a twin-cylinder simple pump and a jack; hence, it is equally serviceable on the road and in the garage. Its two cylin-

Digitized by Google

ders are both connected to the same outlet, thus making plain that the pump is not of the compound variety. The bore and stroke are 2 inches and 11 inches, respectively, and the capacity is 60 cubic inches or air per stroke, the obtainable pressure being 150 pounds to the square inch. In operation, the jack portion of the pump is placed beneath the hub cap of a wheel, and the weight of the vehicle serves to hold the pump securely during the inflation operation. The weight of the complete outfit is 14 pounds and its extreme height, exclusive of the lever, of course, is 20 inches.



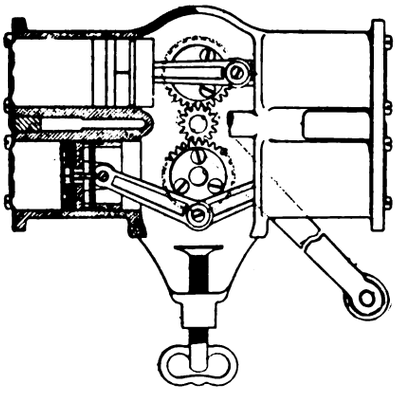
Simple and Compound Action Explained.

Among a number of other styles of pumps, the Gleason-Peters company also produces a two-cylinder simple compressor of rugged construction suitable for use in a public garage, where it is likely to be subjected to hard and continuous service; it is illustrated herewith and scarcely requires description. The cylinders measure 3½ x 5 inches and the obtainable pressure is 60 pounds. Substantially the same pump also is constructed to operate on the two-stage principle, in which case one of the cylinders—the low pressure one—measures 3½ inches in diameter and the other measures 2 inches. In this pump, which is illustrated herewith, the low pressure cylinder exhausts into the high pressure one and on the subsequent stroke the air in the smaller cylinder, already under considerable pressure, is forced into the tire. With this arrangement the obtainable pressure is 150 pounds. Compound pumps of the straight up-and-down type like the Cox pump shown by the accompanying picture, invariably have the smaller or high-pressure cylinder adjacent to the high pressure cylinder with the latter exhausting into the former on the up stroke of the plunger; the down stroke of the plunger then serves to force the air into the tire.

High Pressure Obtained on Both Strokes.

In the Binks compound pump, which is made by the Star Brass Works, of Chicago, Ill., and is illustrated herewith, the cylinders instead of their pistons are connected to the oscillating handle, though the principle of operation is exactly the same as that of the Gleason-Peters. The cylinders are made of seamless brass tubing and measure 4 x 5, for the low pressure and, and 2¼ x 5 for the high pressure. The plunger rods are made of steel and are equipped with chrome leather packings; as a means to prevent tires being over-inflated, a gauge is mounted integral with the low pressure cylinder. The weight of the pump complete is 20 pounds and the obtainable pressure is 200 pounds.

The Carver pump, which is produced by the Osborne & Stephenson Mfg. Co., of Plainville, Conn., and which is illustrated herewith in section, differs from any of the others in that it is of the compound double-acting type. Which is to say, air under high pressure is delivered to the tire on both strokes and not on only one, as is the case with the other pumps. Air is delivered from both sides of the low pressure cylinder to either side of the high pressure piston, and from both sides of the high pressure piston to the tire, giving the same



HAWTHORN FOUR-CYLINDER PUMP

result as if two regular compound pumps were clamped together. The pump is made of heavy, solid brass throughout and has been designed for continuous and hard service.

Two Types of Four-Cylinder Pumps.

Hand-operated pumps having more than two cylinders are few and far between probably the only two that are constructed being shown herewith. The first of them

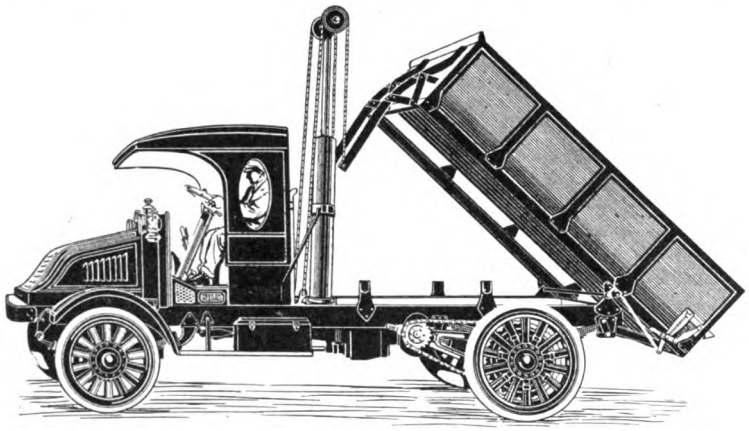
HAWTHORN PUMP IN SECTION

is the Peerless, which is made by the Peerless Accessories Manufacturers of Chicago, Ill., and the other is the Hawthorne, which is produced by the Hawthorne Mfg. Co., of Bridgeport, Conn. Though both of these pumps are of the simple variety and both have four cylinders, they are widely different, as may be seen by the pictures.

In the Hawthorne pump, for instance, the cylinders are horizontal and are opposed, whereas in the Peerless they are vertical and the pistons are operated by a miniature crankshaft in much the same way that the pistons of a gas engine are connected. The operation of the Hawthorne is perhaps best made plain with the aid of the accompanying part sectional drawing, which shows the pistons and their method of connection to the hand crank. To the crank handle there is keyed a spur pinion which meshes with a pair of gear wheels to which the four pistons are connected; the gear ratio is 1 to 2. Air is admitted to the cylinder through automatic valves in the cylinder heads, the valves being mechanically actuated with piston rings. The two crank pins are arranged at right angles to each other, so that when one pair of pistons is at the end of the stroke the other pair is approximately at mid-stroke, thus giving a continuous stream of air. The obtainable pressure is 100 pounds, and as the pump may be clamped to any available shelf or bench it can be moved about a garage and operated in proximity to the work in hand. The weight of the complete pump is 15 pounds.

In the Peerless pump the cylinders are made of close-grain cast iron and for lightness—the whole pump weighs only nine pounds—the pistons are made of steel and are fitted with leather washers; the bore of the cylinders is 1⅜ inches and the stroke 1⅝ inches. The overall dimensions of the pump are 7½ x 9½ x 3, and as the handle is removable and the pump is attached with a clamp, it may be carried in the tool box of a car on occasion.

Double-Acting and Compound Combined.



The Globe "Dead Easy" pump, which is manufactured by the Globe Mfg. Co., of Battle Creek, Mich., and which is shown herewith in section, is still different from any of the others; although it has four cylinders, two of them are high pressure and two of them are low pressure. The high pressure cylinders are placed above the low pressure ones, as is shown in the picture, and the pistons for each pair of cylinders are made integral. In operation, as the lever is moved one way, air is compressed in one of the low pressure cylinders and then transferred into the tire; the same operations take place as the lever is moved the other way, the result being that air under high pressure is forced into the tire on both strokes of the lever. Incidentally, it is pointed out, as the pistons are operated by a link and rocker mechanism their travel at the ends of their strokes, when they are performing little or no work, is rapid; as the air is placed under pressure the leverage increases, thus decreasing the amount of effort needed to obtain the desired pressure.

HYDRAULIC DUMPING GEAR ON THREE TON KELLY TRUCK

Ingenious and Powerful Tilting Device Driven by Engine and Controlled by One Man—Its Construction and Operation.

While it no doubt will be a good many years before the last hand-dumping mechanism, with its rough, power consuming gears, its slow operation and its back-breaking propensities, has been cast into outer darkness and the scrap heap, it will not be the fault of the motor truck people, who are striving manfully to perfect power dumping mechanism and, be it said, are meeting with no small measure of success. A notable example is the Kelly-Springfield Motor Truck Co., of Springfield, Ohio, which concern has placed on the market one of the latest power dumping devices, a hydraulic apparatus that is shown in the accompanying illustration.

WOODS' HYDRAULIC DUMPING GEAR ON KELLY TRUCK

The hoist itself is manufactured by the Wood Hydraulic Hoist Co., of St. Paul. Minn., and is of the hydraulic type. The method of attaching the hoist to the truck, the operating and controlling apparatus and the power transmission gearing all were designed and produced in the truck factory. The central feature of the hoist is the power cylinder in which the pressure transmitting medium is oil, as usual in hydraulic machinery. The cylinder is 6 inches in diameter and its piston is fitted with two rings; from the piston rises the piston rod, 2 inches in diameter, carrying a yoke, on opposite ends of which are two large steel pullies over which run two steel cables. The cables are secured to steel brackets at the front end of the body, while forward of the cylinder they are connected to an equalizing device which eliminates the possibility of one cable bearing more than its fair share of the weight of the load.

The oil pressure pump is of the gear type and is driven at three times engine speed, so that it is unnecessary to speed up the motor when hoisting a load. In fact, a motor speed of 300 revolutions per minute is said to be sufficient to lift a three-ton load and return the body to rest on the frame in about one minute. The pump is driven by chain and sprocket gearing from an extension of the countershaft of the change-speed gear.

The oil pump is engaged by first throwing out the clutch, which brings the countershaft to a standstill, engaging the special pump driving gears by means of a lever on the right of the seat, and then letting the clutch in. The hoist does not begin to work, however, until the driver starts it by means of a special lever on the right side of the truck; this lever controls the hydraulic apparatus directly, independent of the motor driving system. There is no danger in leaving the seat while the hoist drive is in gear, for the drive is locked in the same way, and by spring plungers of the same type as those used in locking the gear-shifting bars—in fact, the locks are identical and interchangeable. The hoist-operating lever is pushed forward to lift, pulled backward to reverse and allow the body to drop, and when vertical is in neutral position, despite the fact that the motor may be running steadily all the time. When the driver again mounts his seat, throws out his clutch and unmeshes the pump driving gears, the truck is ready to be driven and not a single part of the hoisting mechanism will be in motion until it again is required for its designed work.

The new hoist has the advantage that it is easily and conveniently operated by one man, so that an extra hand does not have to be carried for the purpose. Should there be another man on the ground, however, he can operate the hoist control, if so desired, allowing the driver to remain in his seat.

The truck itself is of the standard Kelly-Springfield model, of three tons' capacity, with the motor under a hood of the Renault type and the radiator against the front of the dashboard. Incidentally, it will be noticed that the driver is better protected than in the average truck, there being a neat little cab with an extension roof to keep off the worst of the weather. The enclosure is readily completed by curtains and windshield at the sides and front.

Two Ways of Making Adjustments.

One of the most soul-harrowing things that has to be done on a car is to turn a small nut or cap-screw in an awkward place with a wrench that does not suit the job. It is true that on most modern cars there are far fewer of these abominations than there were a few years back, but they still exist. One experience should be quite sufficient to inculcate the idea that a special wrench exactly suiting the work should be obtained at once and kept handy. There are so many sorts, shapes and sizes of wrenches now stocked by dealers that it always is possible to find one that will do. A good many valve-lifter adjusters are of the double-nut variety, and while such a device really calls for two small, solid wrenches, many a man has worn the skin off his knuckles and ruined his disposition by trying to adjust it with a big monkey wrench and a pair of pliers.

Special Tools for Special Work.

While there doubtless are some cars in which the tool equipment regularly supplied is ample to care for every phase of the routine adjusting work, there are a great many more where there are parts that either are very difficult to get at with ordinary tools, or else are simply out of reach without some special appliance, which may be, and usually is, something of a simple and inexpensive character. There would seem to be a chance for some wide-awake dealer to add somewhat to his reputation and to his collection of modern coinage by making it a point to seek out these spots in his own and other makes of cars and supplying the tools needed. There should be a ready sale for such things, especially if the dealer should take the trouble to make known what he was about—that is, advertise.

Spring Clips that Should be Tight.

Inasmuch as it is a pretty well established fact that most of the spring breakage that occurs is due to loose spring clips, it is a pretty good idea to examine these parts especially after touring and to tighten them if necessary.

SALESMAN'S MOOD THE MEASURE OF HIS SUCCESS

Accidents Are Not Accidents and Neither Are Sales; Both the Result of the Working of Immutable Laws—Advice for Salesmen, Straight from the Shoulder—Instances That Illustrate Principles.

Salesmanship is just as scientific as any other profession and, accordingly, should be given the same careful study that one naturally would give to the study of medicine, or law, or civil engineering, or the hundreds of other professions that require systematic training.

Success in any line of effort comes through the operation of law. It doesn't very often come by chance or accident; at least, nobody gets very far by waiting for that chance to come of its own accord.

In the working out of Nature's laws, there is no such thing as an accident. A piece of rock tumbles from the side of a mountain and lands in the way of a limited train. We are inclined to call this an accident, but it simply is the result of Nature's forces having acted on that rock for a few hundred years or so, says the Studebaker News.

Adage That Fits the Salesman's Case.

Just as it is true of Nature, so is it true of business, or salesmanship, of the professions, of your personal success and mine.

Considering the fact that the success of most of us is measured by our ability to sell things, wouldn't it be a mighty good plan to make a study of the fundamental laws that govern our chosen work?

Across the facade of a New England court house is carved this phrase: "Obedience to Law is Liberty." That's a mighty good adage to carve on the front of a court house, and I don't think it would work much harm to the salesman who pasted it in the front of his hat.

Let us consider for a moment the first and really great law of successful salesmanship—in fact, one of the great laws of success in anything. It is this: Your degree of success is dependent upon your prevailing mood or frame of mind.

The pushing of any kind of business always commences in one's mind. The vision foreshadows the achievement. Every successful man to-day is living ahead of his business and what he is accomplishing now was planned, thought over, and lived in for months and possibly years in advance.

When you stop planning improvements in your work, your business will begin to decline, you will continue to use your shop-worn line of selling talk while the live salesman next door is racking his brains or a new and better argument.

Many a salesman is climbing to success over the backs of his competitors, and they, taking his dust as he passes, are blinded to opportunity and generally blame the house, or the product, or any old thing but themselves.

The live man to-day refuses to use second-hand ideas. The man of initiative is the one who forgets the drag of the past and starts something.

Just What the "Big Man" Can Do.

Another state of mind that has wrecked more salesmen than the armies of the world have killed men is fear of the customer; fear of their ability to sell; fear that their cars are not equal to a competitor's; fear that the Big Man will kick them out of his office.

Then you are a mere order taker.

If you have a feeling of self-deprecation when you are calling upon a prospect, it's a mighty safe bet that the prospect won't regard you or your car very highly unless the firm's advertising has been there first and made the sale before you arrived.

But why should you fear your prospective customer?

In all probability he will not hurt you—very much!

Yours is a plain business proposition: You are trying to sell him a car that will supply his needs. By making the sale you will help him while helping yourself. He can only buy—or refuse to buy. It's very doubtful if he ever did any serious bodily injury to a salesman who presented a business proposition to him in a business-like way.

Putting Confidence to the Proof.

If you have confidence in your house and in the car that you are selling, and believe that it is justly worth the price you are asking for it, your prospect is bound to feel the same sort of confidence.

Once upon a time a prospective buyer entered the office of one of our branches and asked to be shown a Studebaker "20" touring car. He was welcomed by the manager, who quietly explained the merits of that model.

The man listened to the sales talk and asked many questions. Finally he said: "I came in to see this car out of curiosity. I'll have to confess that I had about made up my mind to buy a Blank car. Your talk has not changed my decision entirely, and I'd like to see the other car before I buy."

Of course, this manager, following the old methods, should have camped right on the job of telling this prospect how the Studebaker was superior to the Blank.

He didn't do anything of the kind.

His prospect had expressed a desire to see the rival car before making a final decision—a right and privilege that should not be denied him.

"If you will step into my car," said the manager, "I'll have you taken to the Blank offices. The Blank car is a good one and deserves your study. If, after comparing it point for point with our car, you decide that ours is the better, we shall be very happy to serve you."

This manager not only had the prospect carried to the rival showrooms, but instructed one of his salesmen to accompany him and introduce him to the manager.

What Brought the Prospect Back.

The salesman introduced the man to the manager and told the latter that his visitor was in the market for a car and wished to have the Blank demonstrated. Then he withdrew. Later, the prospect bought a Studebaker.

"Your willingness to have me see the Blank car; your own admission that it was a good car to buy; your offer to take me to the rival showrooms and introduce me to the manager, astonished me," said the buyer. "But I knew that you could not do as you did unless you had absolute confidence in your own car. You evidently had no fear of competition. Your own belief made me believe."

Right here, brother salesman, you have the bed-rock upon which the whole science of salesmanship is built—Conviction based on Confidence!

This is a true story and it is a mighty sure proof that if you are confident, determined, pushing, hopeful and, above all, your business is based on the right state of mind, your customers will feel that spirit and your success will grow accordingly.

National

Announcement of

another series of National Cars—

SERIES V-3

ONLY one car is better than a *National* and that is a *better National.* The best thing we can say of this New Series V-3 is that these cars are the best the National company has ever built. Improved Series V succeeded the Series V., and now comes the perfected Series V-3.

Every new series of *National* cars inherits the "championship quality", and the accumulated result of years and years of development and success has produced the greatest "breed" of cars on earth.

They represent the ideal in motor cars, for comfort, power, efficiency, ease of operation, capability in every emergency, noiselessness and convenience.

They are the natural result of more than thirteen years of constant, all-the-year-round manufacturing experience. We do not make changes for the mere sake of changing; we do not "upset" everything by forcing yearly models.

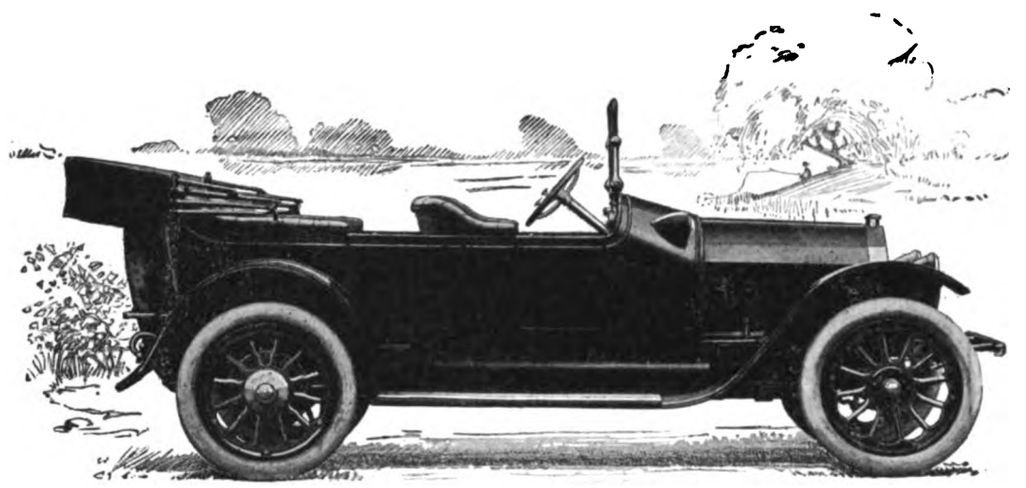
The only standard we try to surpass—*the only standard for us to surpass*—is the *National's* former standard.

The *National* leads the world in demonstration of actual value. The *National* made and still holds the world's record for the fastest 500 miles in the International Sweepstakes races. There are so many such demonstrations of *National* superiority that the *National's* leadership has long been taken as a matter of course.

This New Series V-3 is guaranteed by the National company. No better reputation could possibly be given any car.

Beautiful cars in appearance, embodying the most artistic lines and the most luxurious finish—and mechanically so perfect that riding in one gives you that unconscious confidence and worryless ease which is the acme of touring or travel. They have everything the most exacting owner could desire.

Let us send you complete information on this New Series V-3.



Once a National Owner Always a National Owner

Five Models—$2750 to $3400. Immediate Delivery

PATHFINDER TOURING CAR

40 horse power *120 inch wheelbase*

1914 New Pathfinder Models ready for delivery NOW 1914

¶ The phenominal sales record made by the Pathfinder "40" during the first five months in 1913 makes it possible for us to offer you 1914 models RIGHT NOW.

¶ This is not an announcement of new models for early delivery but means that we can actually *deliver* your cars *upon receipt of your order.*

¶ Pathfinder sales show an increase of 117% this season over a corresponding period of last year, because Pathfinder cars have gained a reputation for reliability that has been spread broadcast by present Pathfinder owners.

DEALERS:—Realize This Advantage

¶ You know how hard it is to sell old models against the new.

¶ You know how much competition will be eliminated by actual ability to deliver 1914 models at once.

¶ This is the exact position we are in today, due to the sales momentum created by Pathfinder cars already in use.

¶ This opportunity may come but once in a lifetime. Tell us what territory you can cover. We want you with us--act quickly as every minute counts.

Motor, Gears, Axles It Is the Best

IN all three "Big Units" the R-C-H is the best popular priced car built. It is the most wisely priced, the most sturdily built and the most thoroughly satisfactory car any dealer anywhere can handle.

The motor is long stroke, big, strong and powerful. It operates at less than one cent a mile for gasoline.

The transmission gears are chrome nickel. They are made extra large and rugged—then heat treated.

The rear axle is of the most practical design. It gives the maximum power with the minimum waste. There is no rumbling; no balking in its co-operation with the other "Big Units."

R-C-H *sturdiness* and *economy* combine to make it a big seller. It is the ideal service car for the greatest number of people. If the car you are handling is above the average man's price wire us for agency details.

R-C-H Reasons:

Left Hand Drive--Center Control--Long Stroke Motor--Big Roomy English Bodies--Stewart Speedometer--Color Option, Russian Green or R-C-H Red--Full Set Big Electric Lamps or Prest-O-Lite System--Bosch Magneto--Jiffy Curtains--110-Inch Wheelbase.

Detroiter

1914 Will Be a Crucial Period

No use talking—next year is going to test the mettle of the men who sell automobiles. The day has passed when "anything on four wheels" could be passed off on the public. People KNOW. Glittering phrases no longer suffice to move cars.

You've Got to Be There With the Goods

Will you be? Are you handling a car that is sound all the way through? That has the features of construction the public has learned are best—the full floating axle, the platform spring, and all the other seven that will make more sales in 1914 than ever before? A car, above all, like the Detroiter, with a low price that just sets everybody on edge to own the beauty?

The Detroiter's Nine Big Features:

1. Long stroke motor.
2. Platform rear spring.
3. Multiple disc clutch.
4. Full floating rear axle.
5. Extra capacity radiator.
6. Enclosed valves, all on one side.
7. Left side drive, Center control.
8. Extraordinary braking surface.
9. Ball bearings throughout.

If you are not there with such a car—get in touch with us before some other lucky man closes the territory.

BRIGGS-DETROITER COMPANY

NoRisko
TRADE MARK
Steering Gear & Ignition Lock

Actually LOCKS the Car!

One Push of the Thumb Makes Your Car Thief-Proof!

NORISKO is the one lock that affords absolute protection to motor car owners. Instantaneously operated from the driver's seat. Has no complicated mechanism to get out of order—is the **only auto lock made** that **cannot** be tampered with without the continuous use of a steel-cutting drill.

Push the plunger **half way** in and **ignition is broken,** rendering the motor helpless; push it **all the way in,** with wheels turned at an angle to the curb, and the **steering gear is locked** in a position that makes removal of the car an absolute impossibility by any means short of hauling away on a truck.

This double protection provides for every emergency. On the road the

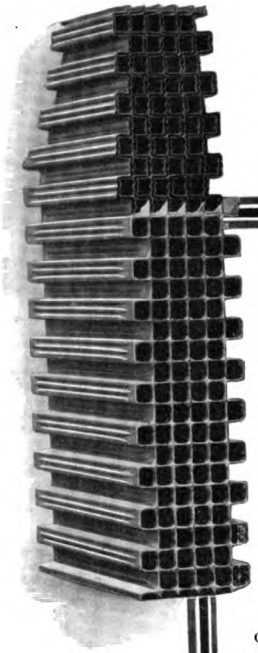
NoRisko
TRADE MARK
Steering Gear and Ignition Lock

both stalls the motor and locks the steering gear, preventing the car from being driven, pushed or towed away. In the garage ignition is broken only (preventing "joy rides"), while the steering gear is left unlocked to permit moving about as necessitated by washing, repair work, etc., or removal in case of fire. To free the NORISKO simply insert key in Corbin lock within the plunger and turn. Price complete (double type), $7.75; single type (steering gear lock only), $6.00.

Readily and Permanently Attached

Two safe screws secure the lock to steering-post without removal of wheel; when drawn up tight the heads twist off leaving each screw riveted and countersunk, flush with shackle. After attachment the lock becomes an integral part of the car and is non-removable.

Write for Our Special Dealer's Proposition



Aggressive accessory men everywhere will realize the opportunity that this novel, effective device presents for handsome profits. Every cautious motor car owner (pleasure or commercial) finds the NORISKO Lock a positive necessity. Send your address today for Special Dealer's Proposition and complete information.

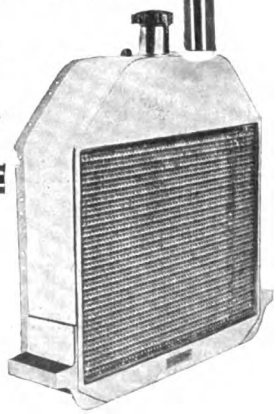
Livingston Radiator

Your customers who are cursing their boiling radiators right now will probably condemn them for freezing and cracking this winter—unless you change them to Livingston.

Livingston Radiators might well be called weather-proof radiators, for regardless of weather conditions their sole function and performance is doing their work without interruption.

Livingston Radiators cool your motor without boiling in summer, and if by chance you should freeze one in the winter it would not be injured in the thawing process.

It is to your interest to eliminate cooling troubles from your customers' cars and to lengthen the life and service of those cars by properly cooling the motor. The one way to furnish this service to your customers is by insisting upon Livingston Radiators upon the cars they buy.



FORD DEALERS. We positively guarantee Livingston Radiators to cool Ford cars or money refunded after 30 days trial. We will allow you a good discount and furnish your customer with guaranteed cooling efficiency that will eliminate all troubles of an overheated motor.

GOLDEN GLOW
ELECTRIC LAMPS

The First and Only Lamps To Pierce Rain, Fog and Dust

Ever consider what lamps mean to the car?

They are the first, the greatest mark of the owner's judgment.

"Golden Glow" Lamps are the mark of the high-class car.

Not only the most beautiful lamps made—the first and only lamps that really pierce fog and mist—but——

The mirrored glass reflectors cannot tarnish—they need no polishing—are mounted so as to be unbreakable.

"Golden Glow" Lamps cost you no more than any high grade lamps with metal reflectors.

We feel we are not overstating a fact when we say——

"Golden Glow" Lamps possess more value—more individual and distinctive features than any other lamps on the market.

The proof awaits you in our "Try-out" offer.

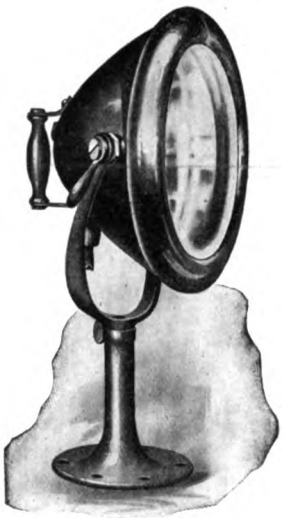
"Golden Glow" Headlights

No projecting parts but the brackets. Special glass reflectors given wonderful penetrating power by secret process. Non-dazzling. Bulbs easily and quickly focused by screw in rear. Furnished in all black, black and brass or black and nickel finish, in 9¼, 11¼ or 12⅛ inch diameter sizes.

"All-Round Ruby Tail Lamp

The neatest and most attractive tail lamp ever offered comes to complete the "Golden Glow" line.

It is a casting of ruby glass, without a metal part but the socket and yet heavy enough to be practically unbreakable.



Being perfectly round it shows red from every direction with the exception of a white circle on one side to illuminate the license number.

"Golden Glow" Side Lights

Identical with the "Golden Glow" Headlights in practically every particular but size, these side lamps are offered with the view to adding materially to the appearance of the car.

Though small in diameter a pair of these side lights will give ample light for city driving.

"Golden Glow" Searchlights

Reflectors are of best quality materials—molded by the world's greatest makers of fine glass. Focusing is done by thumb screw adjustment conveniently placed.

This is the most powerful lamp ever made—the larger size being the equivalent of our special railway and steamboat Searchlight.

The "Golden Glow" Try-Out Plan

The Japanese have a proverb—"One look is worth a thousand words." One look at "Golden Glow" Lamps can tell you more of their merits than a hundred advertisements.

If your dealer cannot show you—send us your name and his on the coupon and we will arrange for you to actually try out Golden Glow Lamps on your car.

We will prove their value BEFORE YOU INVEST MONEY IN THEM.

Try out Golden Glows!

The "Golden Glow" Folder giving sizes, prices, and illustrated descriptions of these lamps for every purpose is yours by return mail on request.

Our special "Dealers' Proposition" is ready for live representatives in every city.

McCUE

WIRE WHEELS AGAIN WIN

Repeating their triumph in last year's Grand Prix, and maintaining the supremacy they won this year in the great American Sweepstakes Race at Indianapolis, WIRE WHEELS CARRIED THE TWO WINNING PEUGEOT CARS TO VICTORY IN THE 1913 GRAND PRIX (France) RACE, JULY 12TH.

GRAND

1st	Peugeot	Boillot	Wire Wheels
2nd	Peugeot	Goux	Wire Wheels

INDIANAPOLIS SWEEPSTAKES,

1st	Peugeot	Goux	Wire Wheels
2nd	Mercer	Wishart	Wire Wheels

It is the handwriting on the wall—a meaning everybody should heed.

For minor reasons such as strength, lightness and resiliency, racing drivers prefer wire wheels—but their greatest reason—the reason why wire wheels are far superior to wooden wheels, for general use as well as in racing contests, is their wonderful economy on tires.

McCue Wire Wheels use Standard (S) Spokes, made from

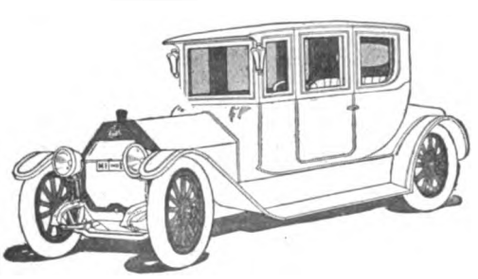
Honest Now, Mr. Automobile Dealer
Are You Making Enough Money?

Here's what a lot of dealers are up against. Maybe you're in this class. They are doing a good business—selling quite a bunch of cars and making a good profit, *if* they could *hang on to it*. But here's where the trouble comes in. Every time something goes wrong, (fancied or real) with the car of the customer, ting-a-ling goes the phone, or in comes Mr. Customer to have his car fixed up, and, of course, there can be no charge, because he bought it from Mr. Dealer and *he* is responsible.

Now there's just one way to dodge all this kind of trouble—get a car that doesn't need much of this kind of attention. Through all these 20 years of auto building, our one goal has been—make the Haynes perfect—make it so trustworthy and simple that it will stay in running order and give satisfaction through hard use and even abuse in the hands of unskilled drivers.

Connect up with the HAYNES



—the Car *Without* the "Come-Backs"

We'll be glad to tell you how simple the Haynes is in every part—glad to tell you how carefully each car is manufactured in our own shops or under our direct supervision—glad to tell you the tests which every separate part, and the car complete are required to meet. We'll also be glad to tell you what Haynes dealers say as to the satisfaction given by the Haynes and how little bother they have with "comebacks."

Specifications of The New Haynes

Motor—Bore 4 1-4 in., Stroke 5 1-2 in. L-head Haynes. Cylinders cast in pairs.
Cooling—Centrifugal pump and pressed steel fan.
Wheel Base—Model 26, 130. Model 27, 136. Model 28, 118.
Ignition—American Simms Magneto.
Lubrication—Splash and gravity feed.
Control—Left hand. Vulcan Electric Gear Shift.
Transmission—Selective Type, three speeds forward, one reverse.
Steering Column—Worm and worm gear type.
Clutch—Haynes contracting steel band.
Rear Axle—Full Floating Timken on Models 26 and 27; McCue, Model 28, Gourney Bearings.
Front Axle—I-Beam. O. H. steel heat treated.
Wheels—Artillery type. Funk demountable rims.
Tires—Models 26 and 27, 36 x 4 1-2 Model 28, 34 x 4.
Springs—Front Semi-elliptic 39 1-8 x 2, rear 48 x 2.
Brakes—15 1-4 external and 15 internal Models 26 and 27. 12 and 16 internal on Model 28.
Finish—Indiana dark blue body.
Gasoline Feed—Pressure. Automatic feed.
Upholstery—Buffed leather—deep cushions.
Starting and Lighting—Leece-Neville electrical system.
Dash Equipment—Electric lights, sight oil feed, automatic cut-out for generator, dash light, auxiliary air pressure pump, air gauge and speedometer, Models 26 and 27 have rim wind clock.
Other Standard Equipment—Top, top cover of silk mohair, mechanical tire pump, rain vision ventilating wind-shield, Vulcan electric gear shift, two large electric headlights, electric side lights, electric tail light, full dash equipment, electric starter, generator, 80 ampere hour storage battery, speedometer, horn, coat and foot rails, tire irons, full tool equipment, and one extra demountable rim.

Digitized by Google

The New Haynes Models Have the Season's Biggest Feature—the Vulcan Electric Gear Shift

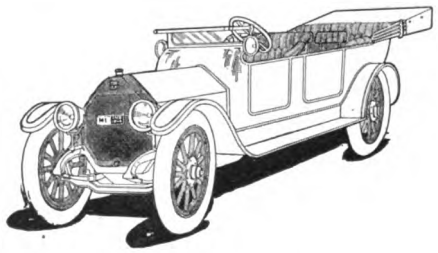
Here's another thing a lot of dealers are up against—and maybe this also applies to you. They're handling a good car, gives good satisfaction, customers pretty well pleased, but the drawback is—there is nothing different, nothing distinctive about the car to make people go out of their way to come in and see it.

The new Haynes has a selling wallop that brings the prospects in and helps you put over the sales. In addition to everything that can be desired in the way of comfort, convenience, equipment and prestige of twenty years building—it has the wonderful Vulcan Electric Gear Shift.

Connect up with the

HAYNES

—the Car That Is Always *First*



True to its reputation as pioneer and pacemaker, the Haynes was first to adopt this, the greatest improvement in automobile equipment. Added to the electric self-starter and electric lighting, is everything else in the way of modern equipment—it makes the Haynes the strongest kind of a selling proposition. Read the specifications and see for yourself.

Get After the Haynes Agency Today

If you are in business for money, not merely for your health—if you would like to get hold of the agency for a car that's a live seller, that's famous for its quality and dependability—that stays sold and stops the "profit-killing come-backs"—if you would like to do business with a *stand-by* and a *fixture* in the auto business, insure your business for the future—and if you would like to make the coming year *your biggest year*, write us today about the Haynes, America's First Car and the car with the wonderful Vulcan Elecric Gear Shift.

The Haynes Automobile Co., 1 Main St., Kokomo, Ind.

Next Week Begins the National Advertising of Continental Motors

Twelve of the leading weekly and monthly magazines are going to tell the general public what you—what every car owner—everybody connected either directly or indirectly with the automobile industry already knows—that Continental Motors are America's Standard.

Continental advertising is going to make the Continental Motor and its superiority a household word—on the tongue of everybody who reads and rides.

It is going to make still quicker and easier the selling of cars and trucks equipped with Continental Motors.

Continental Motors are going to be a bigger selling asset than ever.

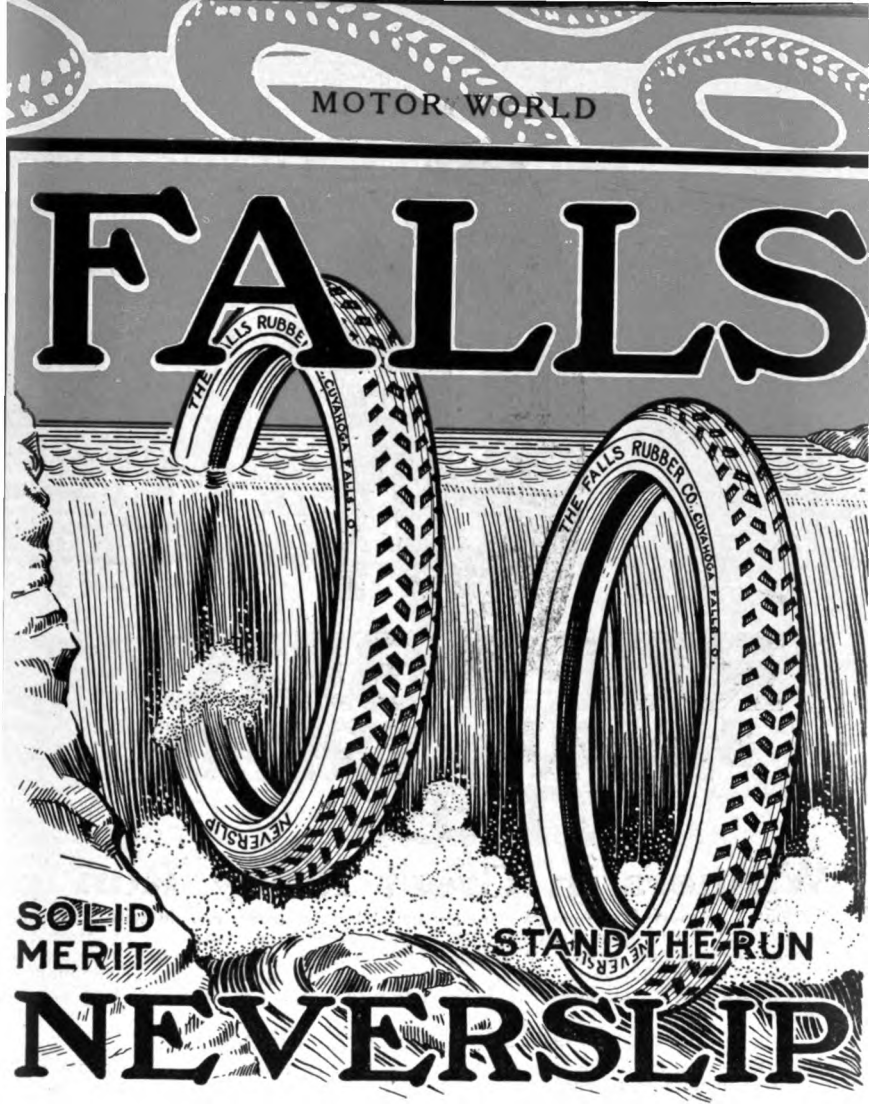
Continental advertising is going to tell the public the history of ten successful years in which 75,000 Continental Motors have carried 75,000 car owners over many millions of easy miles.

It is going to tell the public how Continental Motors, with all their silence, won the slogan, "Powerful as the Nation."

If you are representing a car or a truck built around the Continental Motor, **cash in on Continental advertising.** Advertise it locally. It is going to help sell cars.

For the motor is the vital, the most important single factor in a motor car. It will be the basis by which a car is judged and sold, because it represents more than 20 per cent. of the maker's cost and 50 per cent. of whether the car is a good or bad investment.

If you do not represent a Continental-powered car, get one. You won't regret it. Over half a hundred makers of both pleasure cars and trucks have specified more than 40,000 Continental motors for 1914.



Now is the time. Next season is almost here.

You Make a Wise Choice When You Tour With Falls Neverslip Tires

The tread which has numerous sharp edges gripping the road surface from every angle, preventing a skid by not even allowing it to start.

An excellent reason why Falls Neverslip give extra service.

Buttons and knobs start separation of tread. Falls depressions prevent loose treads and remain a solid mass until the tread is entirely worn out. THIS MEANS MORE SERVICE.

It is worth your while to get our literature and find out more about Falls service.

We still have some good territory open for live agents.

REPUBLIC
STAGGARD TREAD TIRES

Winners in Great Relay Run

The Boy Scouts of America on June 24 were entrusted by President Wilson with a message to Mayor Carter Harrison at Chicago. Four days later the message was delivered on time for the formal opening of the Olympic games. Accompanying the Scouts was the Staver—Chicago News car, the only automobile to make the entire trip. When the Press car was equipped, Republic Staggard Tread Tires were selected because of their reputation for staying qualities and they lived up to their reputation as

THE WORLD'S QUALITY TIRES

The trip was especially trying because of the minimum speed which had to be maintained from start to finish. Over mountains, through mud and under terrific road conditions the Staggard Treads made the trip without a single mishap, finishing with the original air—convincing evidence that they are the best mileage tires in the world today.

THE STURDY

STUTZ

MADE GOOD IN A DAY

Announcement of the Stutz Series E Cars—four and six cylinder

No radical mechanical changes—they were not necessary

The Stutz has been given every test anyone could ask or demand.

It has been sent up against all comers in the hottest races of the world. Racing is subjecting a car to every possible disadvantage in the shortest possible space of time. Out of such tests comes either a car or a memory.

Harry C. Stutz, designer of the Stutz, built his first car in five short weeks, and it finished the first 500-mile race at Indianapolis without even a mechanical adjustment, and jumped into fame over night.

Since that time the Stutz has been entered in thirty-five races, and has to its credit twenty-five victories. It holds the track record for 200 miles. The 500-mile race at the Speedway, Indianapolis, is conceded the most difficult of all races. Any car that even finishes such a race possesses unusual merit.

In 1912, the second 500-mile race, the Stutz landed fourth and sixth places against cars some of which had nearly twice its piston displacement.

The 1913 500-mile event credits the Stutz with third place. Its consistent racing record is equalled only by the service it has rendered to individual owners. Out of all the racing tests has come a better and a truer Stutz. It has proved to everyone that it possesses speed, power, stamina, staunchness, security, safety and strength.

The Stutz is a car of fundamentals which embodies known, tested and proved principles of motor car building and motor car service.

Stutz Features

A Digest of the Peers

1 Dependable Electric Starter.
2 Lighting System—Remy electric generator with storage battery
3 Cone clutch
4 4¾ x 5½ T-head motor in 4-cylinder models; 4x5 T-head motor in 6-cylinder models
5 Stutz special rear system
6 Timken front axle
7 Gemmer steering gear
8 Force feed oiling system through hollow crank shaft.
9 Tires 34 x 4 1-2.
10 Black and nickel trimmings throughout.

Stutz Cars are made in both four and six-cylinder models.

New models now ready

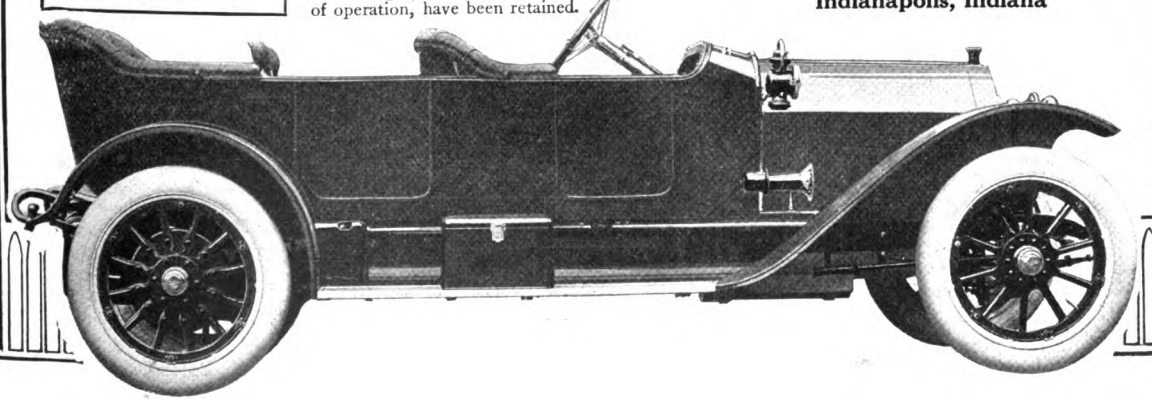
While we have not made any radical changes—they were not necessary—still we found it possible to add a few more refinements and conveniences—making these new models even more desirable than the previous Stutz cars.

For instance, the bodies of the touring cars are larger, roomier, and even more comfortable than heretofore. The upholstering will be generally more luxurious, and the springs a little longer.

The electric starting, lighting and ignition systems employed in the Stutz are separate units, thus eliminating any chance of complication. The self-starter is so simple that a child can understand it. It works quietly and certainly. Electrical experts regard our installation as the simplest, and therefore the best, on the market.

All the special Stutz features that insure strength, speed, sturdiness, ease of operation, have been retained.

Financial responsibility back of the Stutz

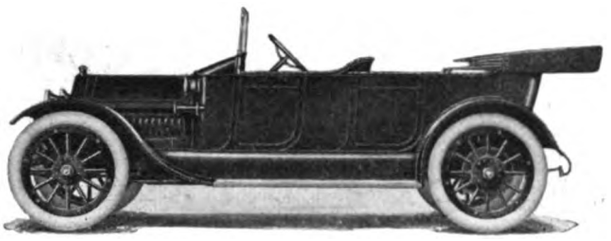


Back of the Stutz car is an institution that is substantial, solid and financially responsible.

Our method of manufacture, as well as the sales distribution, has ever been safe, sane and economical—always with the idea of giving each Stutz owner full measure for his money.

If you are in the market for a car let us know and we will put you in touch with the nearest Stutz dealer—and also send you our new Series E catalog, No. A-15.

There are a few points where we are not now represented. We invite correspondence with responsible dealers.



Stutz Motor Car Company

Lyons-Knight

"THE CAR OF SILENCE"

$2,900

Outline Specifications

ENGINE—Lyons-Knight, four cylinder, four cycle, 4½ inch bore, 5½ inch stroke, water cooled.

HORSEPOWER—50.

OILING—Lyons-Knight pressure feed to all bearings, pistons and sleeves, regulated in accordance to engine power.

CARBURETOR — Improved double jet, especially designed with adjustment on steering column.

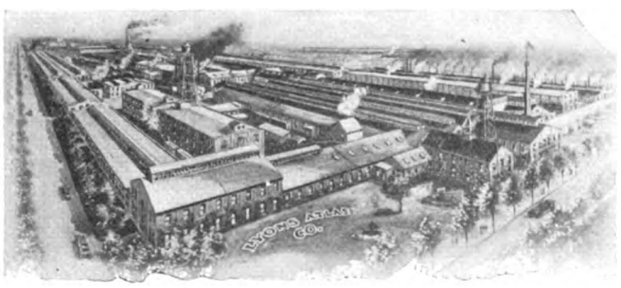
IGNITION — Dual, water-proof, high-tension magneto.

CLUTCH—Three plate, Raybestos faced.

TRANSMISSION — Silent, selective, three-speed, sliding gear type embodied in rear axle housing.

DRIVING GEAR—Worm drive, silent, smooth and always efficient in operation.

REAR AXLE—Full floating, Timken bearings.



BRAKES—Two sets, double acting, internal and external on 16-inch rear wheel drums.

FRONT AXLE—Timken drop forged "I" beam with roller bearings in steering heads and hubs.

WHEEL BASE—130 inches, tread 56 inches.

WHEELS—Wood with quick detachable, demountable rims and 37 x 5 inch tires front and rear. Wire wheels special.

GASOLINE TANK—22 gallon capacity, on upper part of dash over toe board, giving gravity feed direct to carburetor.

The Lyons-Atlas Factory

Including 65 acres, six hundred and twenty-seven thousand square feet of floor space, six miles of railroad with locomotives and cars, giving a capacity for fifty thousand Lyons-Knight cars a year and backed by ample capital to produce this number or more.

The Proposition

Here in brief are a few of the many individual and distinctive features of this car—announced here for the first time. Every element of the Lyons-Knight car is the culmination of years of effort and test—the best that engineering brains, backed by the facilities and materials of ample capital, can afford. Judge these few points:

Famous Knight Engine

During five years of successful use the Knight engine has proved its wonderful stability and endurance. Its famous test by the Royal Automobile Club, of four years ago, has never been equaled, either in the severity of the test or power delivered. In the International Sweepstakes 500 mile race at Indianapolis, May 30th, a Knight car finished fifth. It had the smallest engine in the race, having 250 cubic inches piston displacement against 448 cubic inches of the winner. It was acknowledged by far the quietest, smoothest running car on the track. Its record for economy in tires was remarkable. The water in the radiator registered 130 degrees at the start—130 degrees at the finish. It did not replenish either water, oil or gasoline during the whole race.

The Knight engine has proved in actual service by the testimony of owners, that it becomes better, more powerful, more efficient, after 100,000 miles of operation.

Worm Drive

"Like continuous coasting," is the term used by one passenger to express the smooth, silent operation of the Lyons-Knight car. Added to the silent, smooth-running Lyons-Knight engine is another great feature—WORM DRIVE. The worm gear insures absolute freedom from noise, roughness, vibration and grinding. Reports of the Society of Automobile Engineers show that while more expensive to manufacture than other gears, it is the nearest approach to 100% efficiency in the delivery of power to the axle. It also becomes better with use—gives more power and efficiency year after year.

"The Car of Silence"

Because of:

Silent improved Knight engine,
Silent worm gear drive axle,
Silent improved electric starter,
Silent transmission,
Silent chain for engine parts.

The really startling thing about the Lyons-Knight is its remarkable silence and absolute freedom from vibration. The most delicate woman or child can ride in it for hours at high speed without the slightest fatigue. Noise means excessive friction and wear, and is directly responsible for the fatigue experienced in motoring. All mechanical noises have been entirely eliminated in the Lyons-Knight—the quietest car built. We want you to compare this exceptional car in every detail of construction and equipment with the costliest imported and American cars. We believe you will find it equally as good—and in the multitude of individual and distinctive features and details, superior. We think you will readily agree no such value has ever been offered among cars of the first grade.

Get the Details

Any description of the details that could be crowded into an advertisement would fail to do justice to the car, since so much would have to be left out. But in justice to yourself you ought to know them before investing $2,000 or $3,000 more than is necessary in purchasing a car that will meet your highest ideals in service, capacity and class. Nor is there any reason why you should be content with a medium grade car when the best is within the reach of every man of moderate means. It is worth your while to study the details of this very remarkable car.

Lyons-Knight

"THE CAR OF SILENCE"

To Dealers

$2,980

You—who have had experience—know the greatest argument for any good car are the facts.

We are not making empty promises about the Lyons-Knight car. We want to give you facts!

Here Is What the Lyons-Knight Actually Gives:

(1) A big, high-powered car, combining six cylinder smoothness, flexibility and efficiency with four cylinder economy.

(2) A car with more distinctive and individual features—of better design and quality than has ever been offered at $5000.

(3) Silent Knight motor, silent worm drive, giving absolute freedom from vibration, growing better with 100,000 miles of service.

(4) The most complete facilities for manufacture backed by ample capital, insuring prompt deliveries on all orders.

(5) A most aggressive sales policy, including a great national advertising campaign to make the Lyons-Knight first among high-class cars.

(6) A most liberal dealer's proposition backed by extensive local advertising and sales effort from the factory to help every dealer make greater profits from Lyons-Knight cars.

(7) A complete line including large and small four cylinder Knight cars, six cylinder Knight cars, and light and heavy commercial cars with Knight motors.

What more can you ask for in any car? If you have other requirements—ask about them. The Lyons-Knight proposition may include them also.

You can write us.

We can describe the many distinctive and exclusive features of this car.

The catalog will give you some idea of it.

Our dealer's proposition is most liberal from your standpoint.

But the best way to know the whole matter is to get the facts for yourself.

The Lyons-Atlas factory is a reality. The Lyons-Knight car is not an idea—but an accomplished fact—the cars themselves are ready for delivery.

Come—see for yourself.

Sell the car to yourself first.

View every part in the course of manufacture.

Compare facilities, design, materials and workmanship with what any other automobile factory actually offers.

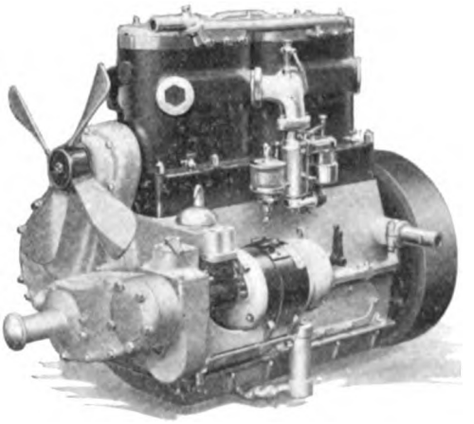
Ride in the Lyons-Knight. Judge if any car—at any price—offers so much downright motor car satisfaction.

Every experienced dealer that has come to the factory has been fired with enthusiasm by what he saw.

Already we have closed much important territory with the best established, most experienced dealers. They have been quick to realize the big, profitable factors in this Lyons-Knight proposition. This opportunity may still be open in your territory. Write and we will let you know promptly.

Write for Complete Information

Outline Specifications



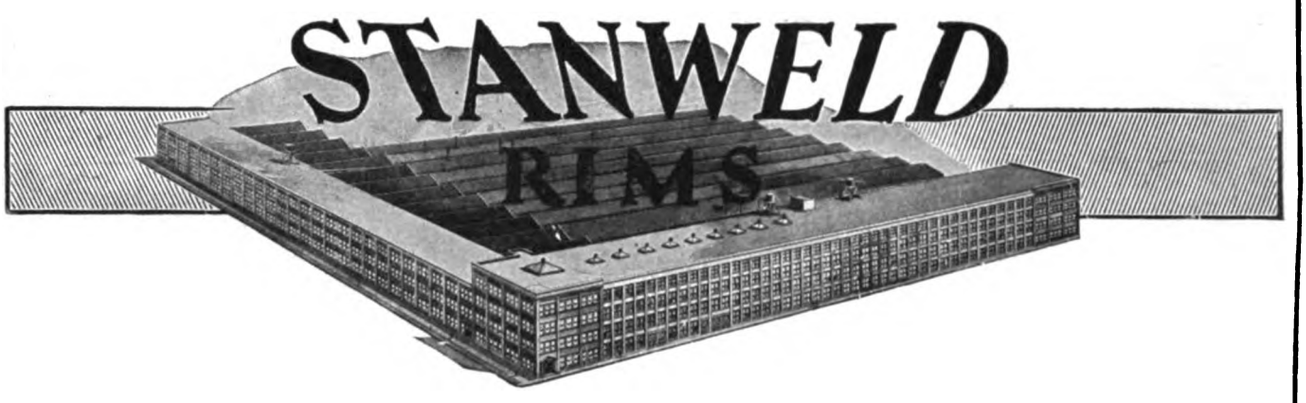
DRIVE—Left hand with center control.

BODIES—Exclusive design, with maximum room and comfort. Sheet aluminum with extra deep, soft, hand-buffed upholstery.

FINISH—Standard colors, dark blue and Brewster Green, with black and nickel trimmings.

EQUIPMENT—Electric starting and lighting, with dash lamp and two-tone electric horn, patent one-man pantasote top with drop side curtains, special windshield with ventilator, dust cover, speedometer and clock, combination tire holder and trunk rack, two extra demountable rims, coat and foot rails, cocoa matting in tonneau and complete tool and tire outfit.

PRICES—Five Passenger Touring Car $2900; Seven Passenger Touring Car $2980; Sedan Type $3900; Berline Type $4300; f.o.b factory, Indianapolis, Indiana.



The Lyons-Knight Engine

This four cylinder Knight engine actually gives the power, smoothness and flexibility of a six-cylinder poppet-valve engine of 50% greater displacement. Its many individual features make it superior in silence, smoothness, reliability, economy and power. Ask for actual proofs by test.

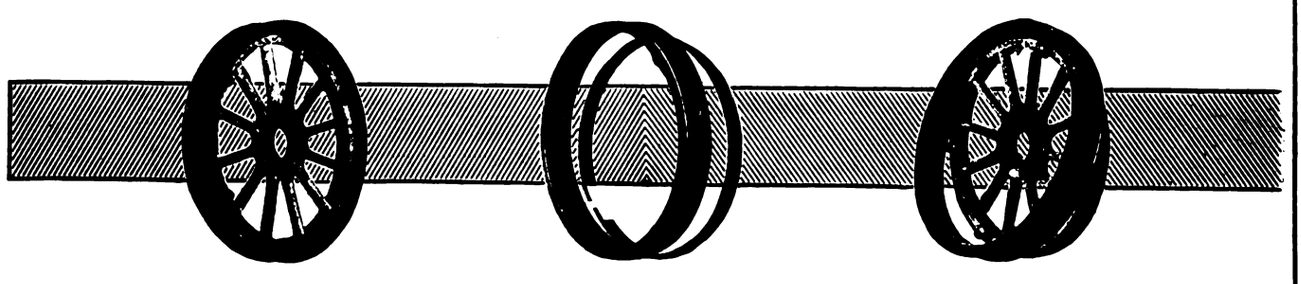
The Lyons Atlas Co.

INDIANAPOLIS IND.

Digitized by Google

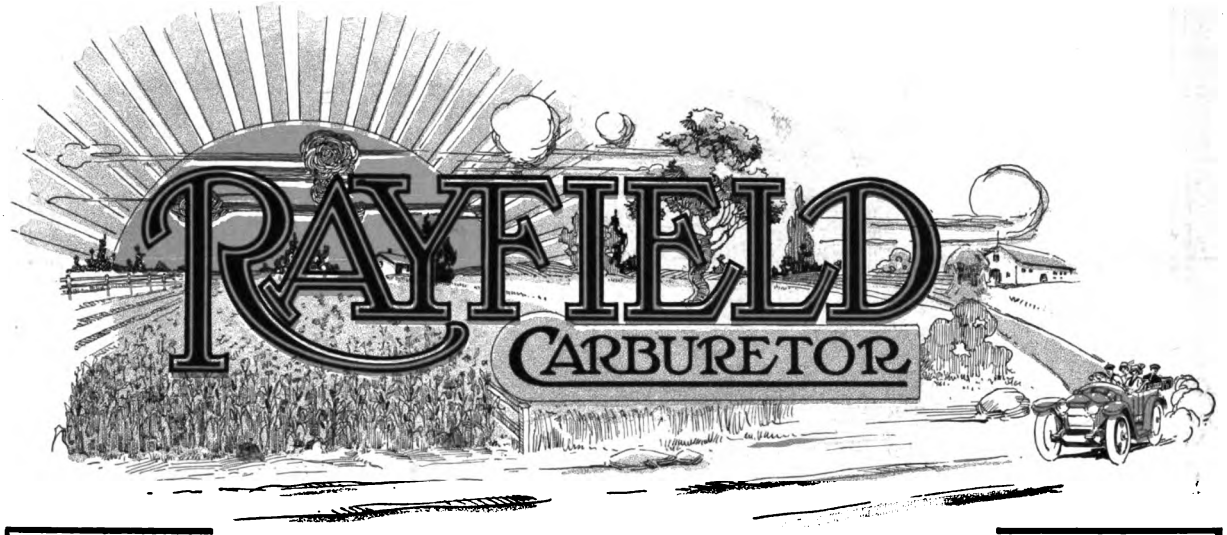
NO automobile manufacturer can make the claim that he is giving his customers the utmost in safety, satisfaction and service, and not equip his car with Stanweld Demountable Rims.

Stanweld Demountable Rims are good rims—good all the way through.



They are made of a high-quality steel, and by expert workmen. They prevent tire-wobbling—one of the prime causes of excessive tire wear. They require no special tools. They have a solid base—excluding dirt and moisture. They accept either straight-side or clincher tires. They have both the quick-detaching and demountable features—operating independently.

They are safe, easy and quick to operate, and require fewer manipulations to change a casing or tube than any other type of demountable rim.



One manufacturer will use nearly 50,000 sets during the coming season.

Points the Way to Real Fuel Economy In the "Six"

In actual performance—on a stock car—the Rayfield has established the world's record for fuel economy with a six-cylinder car.

The record is 20 miles on a gallon of gasoline.

The car was a Knox, six-cylinder, 60-horsepower.

The authority is the Springfield Automobile Club of Massachusetts; and the Rayfield made its remarkable record in the Club's economy contest, under A. A. A. sanction, enabling the Knox to win first position among water-cooled cars.

This is indeed a wonderful performance; but its real significance lies in what the Rayfield promises and has actually done in this instance—in the operation of six-cylinder cars.

Thus the Rayfield again emphasizes its right to supremacy in economy—by sending a large powerful six-cylinder car 20 miles on one gallon of gasoline.

Excessive fuel consumption is a marked characteristic of all six-cylinder cars as compared to the four.

"More miles per gallon" is a cry that is world-wide among motorists.

It would seem that the Rayfield is the answer.

Rayfield users know its remarkable economy. Racing contests time and again have proved its ability to extract the last iota of power and speed from gasoline.

But this we believe to be the most important of all the records that have crowned the Rayfield.

There is a lesson here for both manufacturer and owner—a lesson it behooves both to heed.

All we ask is that you investigate the Rayfield—investigate and compare.

Every Inch a Car

A Striking New "Six" at $2350

A NEW model has been added to the KisselKar line—THE 48 "SIX"—a silent, powerful, well groomed thoroughbred, that sets a new level of comparison and is bound to turn discriminating automobile buyers in the direction of the KisselKar.

The announcement of this new KisselKar model is of greater significance than an ordinary announcement because it carries with it a notice of changing conditions in automobile making—the establishment of values and prices upon a more solid and settled manufacturing basis.

A few years ago, when the KisselKar 60 "Six" was announced, it was at once acclaimed the sensational value in "Sixes." It was the first "Six" to respond to the demand for a high powered six cylinder automobile at a moderate price. HISTORY IS NOW REPEATING ITSELF.

Digitized by Google

KISSELKAR

Electric Lighted and Started 48 "Six" *Left Hand Drive Center Control*

In presenting the new KisselKar 48 "Six" at $2350, the Kissel Motor Car Company is again making automobile history as it did with the big KisselKar 60 "Six" five years ago.

The KisselKar 48 "Six" is the latest big thing in six cylinder automobiles. Point for point, it challenges comparison—in construction, performance, comfort and refinement.

The design is strikingly handsome and original, representing the very best ideas of American and European body construction—a design we expect to see freely copied a year hence. In the 48 "Six" we have succeeded in producing a liberally designed, roomy five passenger six cylinder automobile of medium size that fills the gap between the so-called "little sixes" and the high powered "big sixes."

It requires but a slight study of the KisselKar 48 "Six" to prove it a worthy exponent of all that is best in automobile construction. Its smooth running, silent, powerful and flexible motor has loads of excess power, and is responsive to every demand. Clean, graceful lines, low hanging body, perfect poise and balance, big roomy tonneau, extra long wheelbase, big tires, extra deep, luxuriously upholstered seats combine to make the KisselKar 48 "Six" a car of superlative beauty and riding comfort.

TO OWNERS

The KisselKar line now comprises three striking pleasure car models—the new 48 "Six" at $2350, the 60 "Six" at $3150 and the 40 "Four" at $1850—each an unsurpassed value in its class. An illustrated portfolio giving all details of each model will be sent on request.

TO DEALERS

Our recently acquired Milwaukee plant will be devoted exclusively to the manufacture of the KisselKar 48 "Six." As this gives us a largely increased output, we are in position to add to our list of desirable distributors. If interested, write.

KisselKar Trucks—1500 lbs. to 6 tons—are used in over 200 distinct lines of business. Write for Truck Catalog.

KISSEL MOTOR CAR COMPANY, 159 Kissel Ave., Hartford, Wis.

BOSTON NEW YORK CHICAGO MILWAUKEE KANSAS CITY MINNEAPOLIS ST. PAUL
DALLAS SAN FRANCISCO LOS ANGELES OAKLAND

Philadelphia, Detroit, Houston, El Paso, New Orleans, Washington, Baltimore, Nashville, Duluth, Buffalo, Pittsburgh, Hartford, Conn., New Haven, Albany, Troy, Rochester, Providence, Montreal, Quebec, Toronto, Winnipeg, Calgary, and 200 other principal points throughout America.

Features of the New KisselKar 48 "Six"

An entirely new model in design of chassis and body along with the very latest ideas of motor car building.

Specially constructed frame hung close to the ground, with large "kick-up" in front and rear—providing plenty of spring clearance and allowing more flexible springs and riding comfort.

Clean and simple construction—at a glance you are impressed with the few number of parts.

Tonneau without boxes or brackets to mar the effect of simple completeness.

Rakish new design fenders with rounding tops instead of flat.

Front axle of foreign design with the castor principle, which allows easy turning of car and avoids accidents as the wheels are always kept in line. The construction of this axle also adds strength to the knuckles and main parts.

Large doors, 21 inches wide, and 5-passenger tonneau with room to spare.

Deep, low, properly proportioned seats. Backs pitched for extreme comfort—and cushioned with the finest upholstery.

Patented Golde top, which eliminates front brackets. This top is used only on the very best cars and is remarkably easy to put up and take down.

The "cowl" is equipped with a mahogany board on which all instruments are placed—accessible and convenient to line of vision.

Large 4½ x 36 inch tires—giving the car oversize tires for its weight.

Special flexible spring construction which takes up the jolts and jars.

Extra long wheelbase, 132 inches—which provides space for roomy tonneaus and contributes to riding comfort.

Large gasoline tank (24 gal.) and tire irons in the rear.

Left-hand drive and center control.

Electric started. A simple and positive system that makes starting easy and sure.

Electric lighted. Big, powerful electric lights of twice the candle power of average cars.

Powerful, easily accessible, long stroke motor, with large crank shafts carefully balanced—capable of developing plenty of excess power. Silent, smooth running, responsive.

Four speed transmission—direct drive on third.

Cone leather faced clutch can be disassembled without removing transmission or motor.

The KisselKar 48 "Six" is fully equipped in every detail and embodies every desirable feature for the comfort and convenience of the car owner.

KisselKar Service

The KisselKar is sold under a written guarantee of service to owners—a tangible, definite and specific contract that clearly stipulates the scope of KisselKar Service and provides for care that forestalls trouble and retards depreciation.

Two of the simplest of the many hundred test-gauges that prove the accuracy of Timken-Detroit Axle parts. These two are for gauging circular openings, like those in a hardened ground bushing. One end of the gauge must be too large to go in. And the two ends differ in diameter by only .001 of an inch.

TIMKEN
AXLES & BEARINGS

WHEN you ride in your motor-car do you ever think how much of your comfort and safety you owe to the axles beneath you? Those axles are no mere solid bars of steel. Their hundreds of parts are combined into wonderful mechanisms that drive the car, change its direction, and allow the rear wheels to revolve at different speeds in turning corners.

And, day in and day out they carry the whole load, and take the incessant shocks and vibration of hard travel.

Every part in those axles has a duty to perform.

Every part must be correctly designed for that duty.

It is one thing to make these hundreds of pieces of metal right.

It is another—and just as essential—to prove them right after they are made.

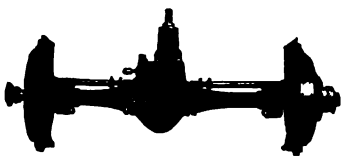
Both are equally important to your satisfaction—and to your safety.

In a Timken-Detroit Front Axle are 125 pieces, in a Rear Axle 723—The 858 are, we believe, the smallest number compatible with strength and safety.

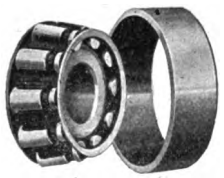
In addition there are 248 separate pieces in the Timken Tapered Roller Bearings on the axle spindles, in the steering pivots, at the differential and on the pinion shaft.

Yet, counting each complete Timken Bearing as only one piece, there are 848 pieces in a set of Timken-Detroit Axles (front and rear) involving 4221 separate operations!

4221 Operations and not one is left to chance



Every operation has its inspection, every inspection its gauge—some require several gauges.



Not one is left to chance, every one is proven.

And back of all are the Swedish Gauges—the highest standard of accuracy in the world.

Back farther-still is the ideal of a great organization of men whose one goal is axle perfection in every smallest detail.

The study of axle and bearing importance is not a dry, technical subject. It is full of live, human-interest stories, and a revelation of the wonders of the modern motor-car. Write today for the Timken Primers, No. T-1 "On the Anatomy of Automobile Axles", No. T-2 "On the Care and Character of Bearings."

The one bearing whose tapered rollers enable it to meet greatest load plus end-thrust, and that is perfectly adjustable for the slight wear that will come to any moving parts, is the Timken Tapered Roller Bearing. No other has ever been used in Timken-Detroit Axles.

HEAVY CAR TYPE

FISK TIRES

Confidence

THE FOUNDATION of all business is CONFIDENCE. The Fisk Rubber Company, from its start, 14 years ago, has had this one idea always dominantly in mind. The original plant comprised only 23,000 square feet of floor space. With the completion of the buildings now under way, the floor space will cover approximately 14 acres—a remarkable growth.

This growth has been due to a concentrated effort to exclusively produce pneumatic tires, with the result that *today we are the largest exclusively pneumatic tire builders in the world.* For more than two years we have been running night and day to endeavor to supply the ever increasing demand—which demand has been built up by the CONFIDENCE the public has placed in the Company. Eighty per cent (80%) of our product goes directly to consumers replacing original equipment.

The manufacturing department has always had but one instruction—that is, to build the best tire that it is capable of producing, from the best materials, with expert workmanship and with the aid of the most advanced methods and equipment.

Labor saving devices, the most modern rubber machinery (some of it designed by our own experts) all go to make our plant the most modern tire plant in the world, and this ultimately benefits the user.

The FISK ORGANIZATION has been developed along the line of CONFIDENCE. *We* have Confidence in our Product and in our Organization and we want *you* to have it in *us*. This you will have when you come in closer contact with us.

Service

SERVICE is a much abused word. It is often used without any regard as to what it really means. The word SERVICE behind any product means nothing, unless the interpretation of the word by the manufacturer is sincere and honest. SERVICE is that intangible something that gives you full value when you deal with a company in which you have CONFIDENCE, and that manifests a personal interest in all details of any transaction.

Fisk Tires are manufactured in a model plant at Chicopee Falls, Massachusetts. They are distributed through 41 Branches located in the principal cities of the United States and by 18,000 Dealers.

These Branches have been established and developed under the personal supervision of the President of the Company. To this supervision is due their present day efficiency.

The Fisk Branches have been established upon the same basis as the factory. They are in reality miniature factories, and at the head of each department is found an expert.

The knowledge that these men possess is freely given at all times to tire users and has repeatedly been successful in solving tire problems.

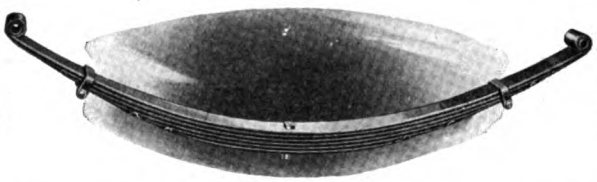
s Rolled Steel in ngs Cuts Upkeep

Cleveland-Canton Automobile Springs

Steel experts have reached the limit, they say, in the new process used in making steel for Cleveland-Canton Chrome-Vanadium Automobile Springs.

This process is exactly the reverse of old-style methods, where bars are rolled longitudinally only.



In this new, patented method, the material is worked both **longitudinally** and **transversely,** or as it is termed, "cross-rolled." By working the material in two directions, an astoundingly uniform, homogeneous, tough, springy steel is obtained.

Then it is tempered, by a special process, heat-treated with oil, given three exacting tests, and finally fitted by hand.

No other springs are made like these. No other springs have such endurance, such strength.

Cross-Rolled, Chrome-Vanadium

"Not a Bump In One of Them"

"Built for Life-Long Endurance"

Motorists who know Chrome-Vanadium Springs enjoy real comfort, real safety.

For such springs protect the engine and delicate mechanism as no other springs can do. *In five years not one Cleveland-Canton Chrome-Vanadium Spring returned because of breakage or settling.*

These are reasons why Cleveland-Canton Chrome-Vanadium Springs are being used on thousands of new cars this year, why makers who have adopted them will never go back to ordinary springs, why our output increased 100% over last year. You ought to know more about springs so unusual as these. We'll be glad to figure with you, and give you full information. Write today.

INVADER OIL

THERE ARE ANY NUMBER OF OIL SALESMEN but it is not always easy to believe what they tell you.

THERE ARE ANY NUMBER OF OIL COMPANIES who fill the pages of magazines with advertisements of their various oils, but it is not always easy to believe what they tell you, either.

ONE OIL COMPANY prints a list of automobile manufacturers, who, it is to be inferred from the language employed, are "vigorously insisting" upon owners of their cars using this particular oil—while as a matter of fact, ***over 70 per cent. of these manufacturers have stated in reply to written inquiries that they either use or recommend an entirely different make of oil.***

ANOTHER OIL COMPANY states that their oil is superior to other oils because it will not "freeze"—while as a matter of fact a motor oil is required to stand heat, not cold. A capacity to withstand cold indicates that the oil has an asphalt base, which is probably the worst thing that can be said about a motor oil.

ANOTHER OIL COMPANY states that their oil is "accurately compounded and scientifically prepared"—which means exactly nothing.

ANOTHER OIL COMPANY states that their oil contains "no carbon"—which is a physical impossibility since carbon is one of the elements of which all mineral oils are composed. (All oils must contain some carbon.)

AND THE VERY OIL COMPANY who claims to know the most and who asks you to use the oil they make because they are the world's foremost experts on lubrication, ***once had some brass tags printed and attached them to the motors of a certain make of automobile, advising the use of a black steam cylinder oil.*** They might as well have recommended a good grade of glue.

THE WHOLE TRUTH OF THE MATTER is that a majority of both those who make oil and those who sell it either know absolutely nothing whatever about it ***or else they are not willing to be honest about it,*** and what they say and what they print proves it.

INVADER OIL

Digitized by Google

INVADER OIL

THESE are the facts. An automobile oil is required to do two things—(1) lubricate, and (2) burn up cleanly—and the ability of any oil to perform these operations can be absolutely determined by the employment of a few simple physical tests.

Take the gravity test as an illustration. Everyone knows that carbon in a motor oil is objectionable, and that the amount of carbon in an oil is proportionate to its weight or gravity. The lighter the gravity, the less carbon the oil contains, and, other things being equal, the better the oil will be.

To ascertain which of two oils has the lightest gravity and the least carbon is easily done. Simply take two samples of oil in glass bottles (Invader Oil and any other) and pour a few drops of the other oil into the Invader Oil. If the other oil sinks to the bottom of the Invader Oil it is because the other oil has a heavier gravity—it will contain more carbon—it will not be so good an oil for automobile lubrication.

To say that an oil with low tests is superior to an oil with high tests is absurd. It is equivalent to saying that 5 pounds of iron weighs more than 7 pounds of iron.

An unsupported statement, therefore, to the effect that one brand of oil is better than another means absolutely nothing. ***The fact that Invader Oils have better tests than other oils, however, means everything.***

The only question which the buyer of Invader Oil has to consider is whether or not Invader Oil is worth its difference in price. ***The fact that it is a better oil cannot be contradicted.***

P. S.—I-O-C GEAR OIL is the only oil ever made especially and exclusively for the lubrication of automobile transmission gears. "It puts noisy gears to sleep." Write for prices and descriptive booklet.

We Are One of the Pioneers in Machining Crankshafts

—been machining crankshafts exclusively for years. Our plant is second to none in the completeness of its equipment. Every machine is up-to-date and the best that money can buy.

But, machinery and plant are things that money can buy in the open market. They can be duplicated. Therefore we claim no special merit for ours except that they are the best.

The feature that makes MICHIGAN CRANKSHAFTS better, finer, more accurate, and saves time, money and patience on the part of the engine builder or car manufacturer is the skill and experience that comes from specializing on one particular job for many years.

You get better SERVICE all the way through when you deal with us——

Because of concentration and longer experience.

Because we limit our capacity—don't crowd—never take more business than we can handle.

Because of completer equipment—result of specializing on one thing.

Because we make deliveries when promised. And——

Because closer inspection at our plant assures fewer rejections from you. Last year we had **less than two per cent. rejects.**

We are after your business. You will like our way of handling it. Better not wait too long before sending your blue-prints.

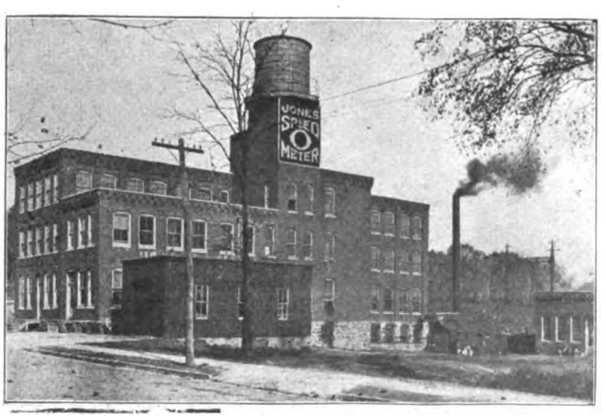
Use the Jones on Their Private Cars

The Jones Leads

in the Famous Motoring Countries

—in England, France, Germany, Russia, Belgium, Italy, Spain, Denmark, Switzerland and Sweden, no other speedometer sells like it. In America alone, this year, 200,000 cars will be equipped with the Jones Speedometer in addition to the thousands of Jones' used on cars abroad.

There are no other countries in which so much attention is paid to accuracy in mechanical construction. The Jones has always led abroad because it is the accurate speedometer. That fact is never questioned. No foreign car, or instrument, is more carefully produced.



That is why the Jones is true.

Winter and summer, without compensators, the Jones remains absolutely accurate. It tells the true speed at every speed—from one mile per hour up to the maximum.

It responds at once to every speed impulse. No sluggish pick up. No slow return. That is because of unbroken connection between the road and the indicator.

The hand moves or rests as steadily as the hand of a watch. No quivering. No vibration whatever. The immovable dial makes reading easy. So do the large, black figures. These are the facts we are telling to people who are thinking of your car.

Every month in the country's greatest magazines we are showing page and double-page ads. Some 15,000,000 people are becoming convinced of Jones worth in this way. Already there is a double demand for the New Jones Speedometer. People are using their cars the year 'round and they want "year-'round" accuracy. In all our experience there was never a time when this single feature meant so much. Every car maker should give it careful thought.

The New Jones

Digitized by Google

Jos. W. Jones' Way

There are several ways to build a Speedometer.

This is how Jos. W. Jones—called the Master of Accuracy—does it: He uses the Gyroscope Principle. That avoids, without any special arrangement, all the effects of heat and cold. It insures absolutely accurate reading in both summer and winter temperatures. It permits of Jones Accuracy in every Jones Instrument—even the least expensive models.

Mr. Jones invented the speedometer for use on motor cars. He invented the Disc Record for talking machines, which made it possible for those machines to reproduce sound more accurately.

Some 50 inventions are to his credit, and accuracy is the keynote in all of them.

In the New Jones Speedometer he has bent every effort to surpass everything else in this respect.

Micrometer Exactness

He has made every part that turns in a bearing measure up to the ten-thousandth part of an inch. He has hardened all bearings by the Harvey Process and ground them to absolute exactness to eliminate wear and insure lasting accuracy. He has further protected every Jones instrument with 58 hardened, imported steel balls in these bearings. He has given each instrument countless inspections—and 16 running tests.

In Service 13 Years

This is the Standard for every Jones Instrument. He has put his signature on the New Jones as a sign that it meets with his every requirement—that each shows the true speed—and that each will last years under tests the most strenuous driver can give it.

Because of these standards, old Jones instruments are serving on their fifth and sixth cars—instruments made 13 years ago. Owners have volunteered the evidence.

Don't you want a speedometer that is good for these years on your car?

Gyroscope Principle

A Gyroscopic ring revolves at an angle in the New Jones. The faster it spins, the more nearly horizontal the ring has the tendency to set—the higher its lower edge is raised.

That change in its angle directly effects the movement of the hand on the dial. There is no surer way to indicate speed.

Write Us

We will send a representative to see you if you wish. He has all the Jones facts and the Jones proposition at his finger tips. When will be convenient?

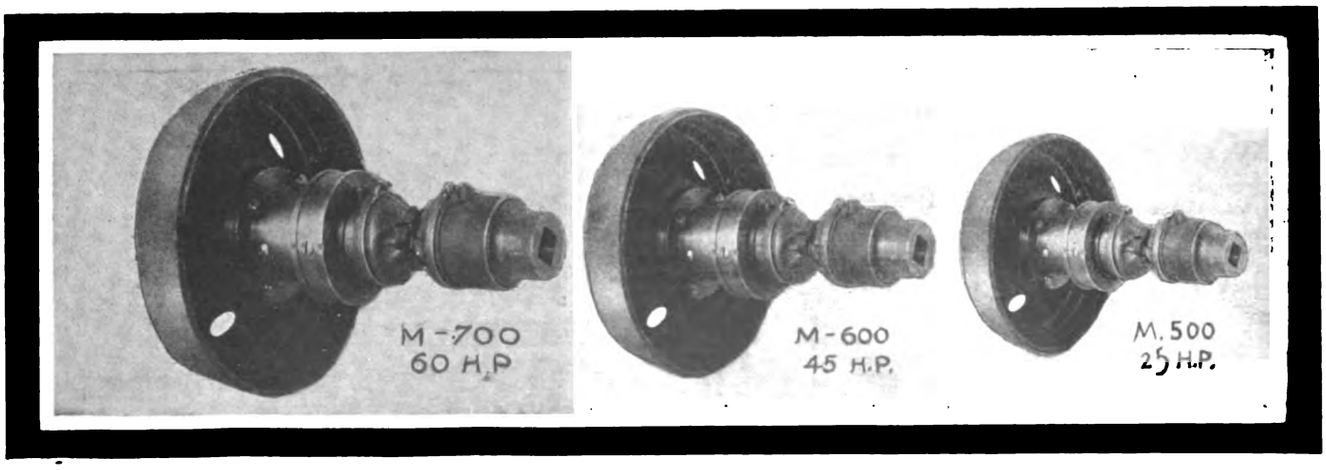
Hartford Cone Clutches

PRACTICALLY every automobile and truck manufacturer who started equipping with Hartford Cone Clutches has continued to do so ever since.

Each year we have added to our list of customers, booking contracts for their cone clutch requirements invariably each succeeding year.

This is true in both pleasure car and commercial truck branches of the industry.

We have done our part to merit this kind of business. We have always made cone clutches—being firmly convinced that the cone type was superior to any other.



Of course we are making a better clutch today than ever before. Our equipment of special machinery enables us to simplify operations and to do more accurate work.

Our machinists and mechanics, (many of them have been with us for years) are clutch specialists, not merely skilled mechanics.

All these things: the way our customers stay with us, the consistent increase each year, our ability to produce efficient and trouble-proof clutches and to meet delivery dates promptly have a meaning to manufacturers and designing engineers. Those in the trade already familiar with Hartford Cone Clutches know the value of a clutch of correct principle, made of the best materials, in shops where special machines are operated by clutch specialists.

The meaning is just this. Hartford Cone Clutches do their work better than others and are never a piont of weakness in the make-up of either pleasure cars or trucks.

The Knight Motor Best

Poppet valve motor in official test falls far below the Knight record

This is the story of two 38 horsepower automobile engines—one a six-cylinder *poppet valve* motor of 1913 design, and the other a four-cylinder *Knight sleeve valve* motor built in 1909—four years ago.

The poppet valve motor was tested by the Automobile Club of America—the Knight by the Royal Automobile Club of England.

The poppet valve motor was under observation 300 hours—*the Knight for 320 hours.*

The maximum pewer of the poppet valve was 44.9—*the Knight 59.*

The average power of the poppet valve was 35.7—*the Knight 53.*

The minimum pewer of the poppet valve was 28.7—*the Knight 51.*

At the end of the tests the poppet valve motor was found to be delivering less power than at the beginning, while the Knight showed considerably more.

During the test of the poppet valve engine, valves were twice adjusted when the power fell off—*during the test of the Knight motor no adjustments to the mechanism were made at any time.*

It is conceded that the poppet valve motor which was thus tested is one of the most highly developed poppet valve engines manufactured; that the test was conducted by the Automobile Club of America is proof that it was accurate. Hence the superiority of the Knight type motor has been proven *by the poppet valve itself*, and again supports the statement that—

The Stearns-Knight "Four" is better than any poppet valve "Six," and that—

The only car better than the Stearns-Knight "Four" is the Stearns-Knight "Six."

The F. B. Stearns Company

CLEVELAND, OHIO

Branches and Dealers in 125 Cities

The most sensational feature of the 500-mile Indianapolis Decoration Day race was the performance of a 25 H. P. Knight-motored car, which, although by far the smallest car in the contest, ran consistently throughout, averaged nearly 70 miles an hour, and did not take oil or water from start to finish. It defeated 19 high-powered foreign and American machines, and finished fifth behind cars of far greater power.

Europe's Leading Car

Lancia

sells at

AMERICAN PRICES

Town Coupe.
30 H.P.
Price $5500

The average would-be owner of a foreign car associates out-of-ordinary quality with prices beyond reason. He, in common with the majority of those who understand car value, wants such a car; but the prices of European products are prohibitive.

Lancia cars with all of the swing, dash and exclusive design, that only foreign designers and artizans can make possible, sell at American prices.

Lancia cars, made from steel that only Europe can turn out and with engineering features that America cannot touch, sell for American prices.

You, Mr. Dealer, have a market place for the Lancia, the car of durability, silence, flexibility, speed and rakish design. We will help you make your sales. Write and get our plan and proposition.

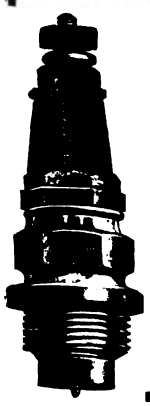
SPLITDORF

"Always There"



Well done, is twice done.

And every detail of SPLITDORF PLUGS is well done to the point of perfection.

The insulation of SPLITDORF PLUGS is high quality mica and designed and manufactured to absolutely withstand the breaking down effects of high tension current.

The design of the SPLITDORF central electrode is proof against all expansion and contraction.

The construction of the SPLITDORF shell allows small space for gas and its shape prevents all trouble due to pre-ignition on account of red-hot metal parts.

The SPLITDORF PLUG is less liable to short-circuit from carbon deposits than any other form of plug ever put out by any manufacturer.

In no one detail, in fact, where soot-proof, gas-proof and unbreakable PLUGS are concerned is SPLITDORF method not *twice done.*

Remember, All! "New ignition for old" is our slogan--We have a SPECIAL EXCHANGE proposition of the greatest interest to every owner of a gasoline motor who would save time and money. Write or call TODAY for particulars.

Saved!

Weed Tire Chains enable you to safely make sharp turns and quick stops when a momentary loss of control means loss of life.

The above picture illustrates one of the numerous situations in which you may be placed during bad road weather — when suddenly someone appears directly in your path and in a fraction of a second you must make a sharp turn and apply the brakes. It is then you require a firm unfailing grip on the road which can only be obtained by equipping ***all*** tires with

Weed Anti-Skid Chains

The Only Device that Absolutely Prevents Skidding

The memory of one accident deters future enjoyment in the use of a car. Why run the risk of such accidents and why forfeit the pleasures of motoring ***forever after, when safety can surely be yours by equipping all four tires with WEED CHAINS?***

WEED CHAINS cannot injure tires because "they creep." Easily put on in a jiffy without the use of a jack or other tools. Directions packed with every pair.

Universally Used

WEED CHAINS are generally regarded as the most profitable accessory for the automobile Dealer — Extensively Advertised — Easily Handled — Quick Sellers — No Dead Stock — No Dull Seasons — Liberal Profits — Satisfaction Guaranteed.

Attractive, Decorative, Convincing Hangers regularly supplied to Dealers upon request

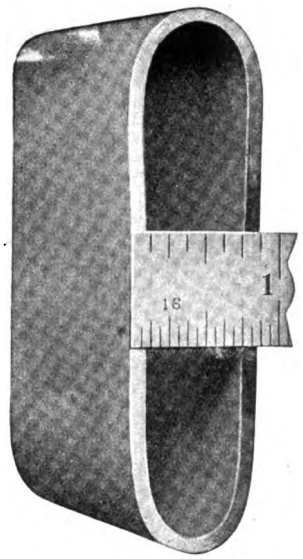
MARATHON

SPEED ENDURANCE



Double Strength Red

INNER TUBES

50% of tire troubles result from poor inner tubes, because ordinary tubes are only about half as thick and half as strong as they should be. Dealers know that.

Men are demanding better tubes—more rubber and better rubber—not mere compound.

The Marathon tube comes to fill that demand. It gives just what motorists have long wanted. It gives all that can be built into a tube. Here are the reasons why it is best, and why you should sell Marathon.

Para-Rubber

In Marathon tubes we give the utmost in quality — the best tube quality known, and we'll prove it. They are made of **Para-Rubber**, prepared by our special formula. This gives it greatest strength and toughness and very long life. Such quality cuts our profit, but it is certain to win and hold the business.

6-Ply Red Stock

To obtain utter perfection and utmost strength we use 6 plies of stock (9 plies in 4½ to 6 in. sizes). That prevents all flaws and weakness. The chemical action of our red coloring matter renders the Pure Gum non-heat effective. This tube will not stick to casing, where pure gum grey tube will.

Weighed and Measured

Each Marathon tube is put to a double test for accuracy.

The raw tube is first weighed and then measured. If it falls short of the exacting standard, it does not pass. Thus we secure absolute accuracy and uniformity.

Doubly Thick and Strong

Thus you see how we put double strength and double efficiency into Marathon Red Tubes.

Note the illustration. It is an actual photograph of a section of 34 x 4 inch Marathon tube. It is nearly twice as thick as the ordinary tube. It is very difficult to pinch, and twice as hard to puncture.

Think how this tube must save trouble and expense.

Dealers, write for special Proposition and a sample section. Then you will sell this tube.

Compare This Tire

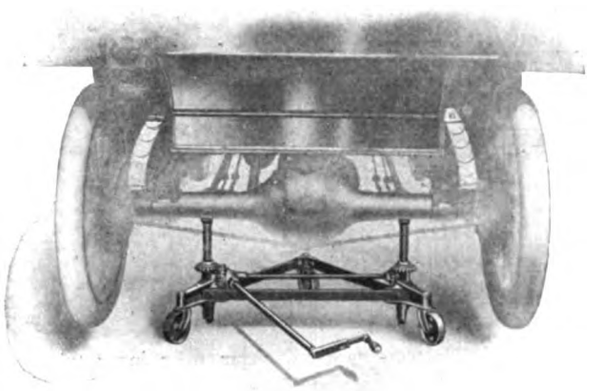
Compare the Marathon tire with the next best you know.

And remember these Marathon features: Only Top-Test materials are used. The utmost in quality is built into Marathons.

We build Marathons by hand, very slowly, to insure utmost accuracy. We use the Marathon single cure process, which insures unit construction.

We concentrate the tread—build it thickest where most wear comes. We give the great angle non-skid tread, and beneath it a thick plain tread. We give a rigid 4,000 mile guarantee. But the average mileage is far above that.

Compare this tire with others, and you'll sell Marathons.



Write for our agency proposition.

Every Garage Needs

WEAVER
Auto Twin-Jacks

No garage equipment makes as much money for the garage owner as do Weaver Auto Twin-Jacks. They will pay for themselves every month they are in service.

There is scarcely a minute of the day that these Jacks can not save money for the garage owner. Time, Labor and Floor Space cost money and Weaver Auto Twin-Jacks will save one-third of this expenditure.

MEET EVERY REQUIREMENT

Wherever cars are to be handled—in the repair shop—storage room—show room—paint shop—or unloading from freight cars—these jacks and ONE man can do the work in a few minutes' time.

No public or private garage can AFFORD to be without them.

BALL AND ROLLER BEARING

The casters and lifting mechanism are ball and roller bearing throughout. The heaviest pleasure car can be raised with ease. Lifting leverage of 400 to 1; 34-inch wheelbase; wheels have 2-inch face; weight of each jack complete, 47 lbs.

THE FEDERATION OF TRADE PRESS ASSOCIATIONS OF THE UNITED STATES

Business Promotion Through Trade Press Efficiency

is to be the keynote of the most notable gathering of technical, class and trade journal editors and publishers ever held in America. No live manufacturer, sales manager, advertising man, trade paper editor or publisher can afford to overlook the

Eight Annual Convention of the Federation of Trade Press Associations in the United States at the Hotel Astor, New York, Sept. 18, 19, 20, 1913

Two sessions will be held daily. There will be editorial, circulation, advertising and publishing symposiums under competent leaders. Many of the leading editors, business managers, buyers and sellers of advertising, and authorities on modern merchandising methods will take part. On Friday afternoon, September 19, there will be a mass meeting with addresses by representative business and professional men, on subjects of timely interest to editors, publishers and advertisers. Distinguished guests and worth-while speakers will be at the annual banquet, which will be made a memorable social occasion. No matter what may be your connection with the trade journal field, if you are interested in the idea of business promotion through trade press efficiency, if you believe in business papers for business men, you will be welcome at all sessions.

What is a REAL Tire Protector?

One that does not chafe the tires.

What is the cause of chafing?
Loose fitting protectors, due usually to stretching.

Can stretching be prevented?
No—leather, and even fabric, is bound to stretch.

Can it be overcome?
Yes—by pulling the protectors tight by means of stiff springs which take up the stretch automatically.

Are such protectors made?
Yes—the spring attachment is a patented feature of the oldest and most successful make of protectors—

INTERLOCKS

Double Your Mileage and Stop Tire Trouble

Interlocks are complete inner tires—not inner shoes—placed between the outer casing and inner tube to strengthen the casing and protect the tube from punctures. They insure safety—make new tires give twice the usual mileage, and add 1000 to 5000 miles to old ones. Don't affect resiliency. Make your tires blow-out proof.

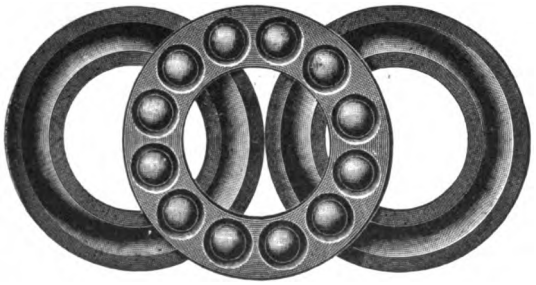
TRIPLEX



A FUEL SAVER and
A MONEY SAVER

Increases Power
Decreases Cost

The Triplex is a device placed between the manifold and the carburetor to break up the mixture. No matter how imperfectly the carburetor does its work, the Triplex equalizes the mixture, producing an explosive gas of even, uniform quality that will burn clean to the last atom. This means that the user gets all the power all the time—that every fraction of energy to be obtained from the gasoline is produced and used. There is absolutely no waste. High proof gasoline is made out of low, and over 25% is saved on every gallon. For further information write us.

STRENGTH COMFORT BEAUTY ECONOMY
IT'S IN THE SPOKES

ANNOUNCEMENT TO DEALERS

We have hundreds of inquiries from automobile owners who want to buy our wheels because they solve the tire problem and double the life of all tires, at the same time making the car ride with luxurious ease. These inquiries are from all sections of the country. With our present distribution we are unable to handle them to advantage.

If you are in a position to handle our wheels and to give demonstrations of them we can offer you a liberal selling contract with exclusive territory and no competition. Ours is a free-trial, money back proposition to the consumer. For the dealer it means quick turns of the small amount of money invested and unusually attractive profits.

Write immediately and get the advantage of our extensive summer advertising.

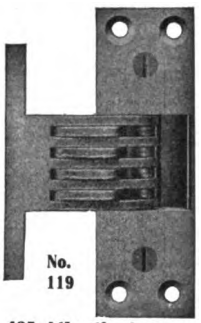
Is Electricity Cheaper Than Gas Light?

How much does a battery cost? How long are batteries lasting? How much do other repairs and replacements cost?



The average user of Prest-O-Lite pays $10 a year, or less, for light.

If any editor, or any advertiser, claims that electric lights cost less to use than Prest-O-Lite, you can easily prove that he is either ignorant or worse.

If you want the facts, write us.

The Prest-O-Lite Co., 287 Speedway, Indianapolis, Ind.

THE SOSS INVISIBLE HINGE
IS
Absolutely Waterproof

OUR No. 119 concealed Automobile Door Hinge, in addition to the "Soss" interlocking construction, insures long wear, absolute rigidity and a perfectly smooth swinging door.

Made in two sections, the hinge can be easily attached and detached. Water will not reach the wood of the body through the hinge.

Send now for our catalog "F." It's interesting and instructive.

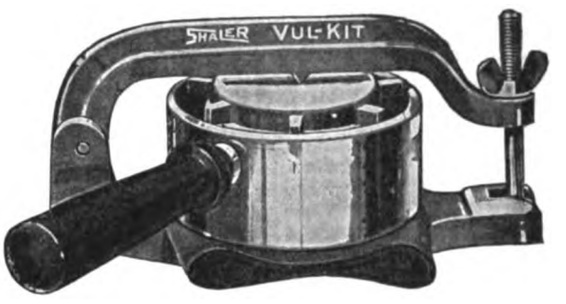
Every Auto Supply Salesman ought to read this advertisement



SALES MANAGERS: You will find it to your advantage to impress these facts on the boys who sell the goods.

The one accessory that the motorist *must* buy from *you.*

Look over your stock. How many accessories of real utility do you see which are not furnished in one form or another with the car?

Shaler Vulcanizers stand pretty much alone, don't they?

A reliable vulcanizer is a necessary part of **every** motorist's equipment. Tire trouble is the motorist's weak point. It's easy to sell him something that will eliminate it.

The Vul-Kit - - - - - - $2.00

SHALER Tire Vulcanizers

There are Shaler Vulcanizers for every requirement, from the $2.00 Vul-Kit for mending a tube puncture now and then, to complete plants for public garages. They are made by the largest exclusive vulcanizer manufacturers in the world, a concern that devoted all of its energy to making reliable tire repair equipment.

An Accessory that Sells Easily

Any motorist can see at a glance how a Shaler will save him time and money; how it will make him independent of the repair shop. It will solve his tire repair problem at very little expense. He doesn't need to be an expert to do the work. Elbert Hubbard says, "A cascaret has nothing on my Shaler."

How to Sell Shalers

Most motorists are familiar with Shaler Vulcanizers in a general way because they have read our advertisements. When they come in and complain about their tire troubles it's up to you to suggest a Shaler as the sure remedy. Dont' wait to be asked. Spring it on your customers. Sell vulcanizers to them with the understanding that it's a "make-good-or-money-back" proposition.

Special Notice to Salesmen:

If you haven't a copy of "Hints to the Busy Salesman" don't fail to write for it at once, stating what concern you are connected with. "Hints" is an interesting little book that will help you sell more accessories for your house. Nearly 5,000 accessory salesmen are carrying it. Get your copy postpaid for the asking.

Vitalized Rubber calls a halt on "Short Mileage!"

At last science gives you more rubber-shod mileage

Diamond (No Clinch) Tires

now made of VITALIZED RUBBER —a new process of toughening pure rubber

Cross Section Diamond (No-Clinch) Tire

You get Vitalized Rubber in Diamond Tires---NOW

A tire made of pure rubber only would fail to give the necessary mileage because it would not be *tough* enough to withstand road usage. And a tire containing too little pure rubber would not have the necessary staying qualities.

Our chemists have discovered how to scientifically toughen pure rubber by a new process. The result is additional mileage for you. The pure rubber we use comes direct from the trees of the tropics—it is fresh and contains all the vitality of youth —it is elastic and easy riding. Then we toughen this pure rubber so as to give it the necessary vitalizing, wearing, *more mil age* quality.

This scientific process has been vainly sought after for years by tire makers. After 15 years of successful tire making we have solved the problem—and you enjoy the benefit of our really wonderful discovery in "Diamond" Vitalized Rubber Tires.

Add to this the Diamond proven principles of proper construction—nothing inferior in rubber, fabric or workmanship—and you have as perfect a tire as money can buy.

Here is a combination of easy riding and more mileage advantages you can't get in any other tire today—*Vitalized Rubber, Perfect 3 Point Rim Contact, No-Pinch Safety Flap* for inner tube protection, and, if you wish, the now famous Safety (Squeegee) Tread—made to fit all types of rims.

So this time buy Diamond Vitalized Rubber Tires---you can get them to fit your rims from

Diamond Dealers Everywhere

A Perfect 3-Point Rim Contact Tire at last

Diamond 3-Point Contact Tires hold with a vise-like grip, absolutely preventing the tire from breaking above the rim, insuring no rim skid—no rim trouble at all. Our engineers have mastered the principles of Rim Contact construction, and you can now get the Diamond (No-Clinch) Tire, with a Perfect 3-Point Rim Contact—an important advantage that has heretofore been overlooked.

No-Pinch Safety Flap absolutely protects the inner tube

The No-Pinch Safety Flap that comes in every Diamond (No-Clinch) Tire will reduce your inner tube bills—because it forms a substantial wall separation between the inner tube and the rim, making it impossible for the inner tube to be pinched or cut under the rim, or injured by rim rust.

This No-Pinch Safety Flap is made of the best grade of fabric, and is finished with a "Feather Edge" as a further protection against inner tube cutting.

There is no rubber in this flap to adhere or vulcanize, so that the inner tube can be quickly and easily removed at all times—another big Diamond advantage.

Diamond Safety (Squeegee) Tread for Automobiles, Motorcycles and Bicycles

Be a Diamond Dealer

If you are not a Diamond Dealer, now is the time to get in line. There is a Diamond Branch near you—get in touch today.

American Museum of Safety favors Standard Warning Signal

From an article in the Scientific American Supplement of April 13th, by Frederic Remsen Hutton, Vice-Pres. American Museum of Safety, Vice-President American Society of Mechanical Engineers, Chairman of Technical Committee, Automobile Club of America.

"A WARNING SIGNAL must not only impress sound waves on the drum of the ear, but it must reach the mind behind the ear and cause volitional action. The signal should carry its alarm notice over the distance of at least one block, to even a deaf or slow-moving person, against the wind and other noise of the street.

"The warning signal should be of the quality not attaching to any other street noise and it should be audible from such a distance that the person warned should not jump with a nervous movement to avoid something that seems at his side before he knew it was anywhere near him. To sound the signal unnecessarily not only makes the street more noisy than necessary, but also it breeds the habit of disregarding the signal when it is full of real meaning.

"A true musical note is not as serviceable for arousing attention or for warning. The short explosive note of the diaphragm types of signal, where a steel diaphragm is set vibrating by an electric motor, makes the first sound waves as effective as those which leave the signal later, and this is its best claim to be a safety device, in the sense that the American Museum of Safety uses that term.

"The common pneumatic reed actuated from a hand-bulb cannot be heard in noisy traffic or against strong winds for any considerable distance, or even a city block, and is scarcely, therefore, entitled to be classed among safety devices, in the Museum sense."

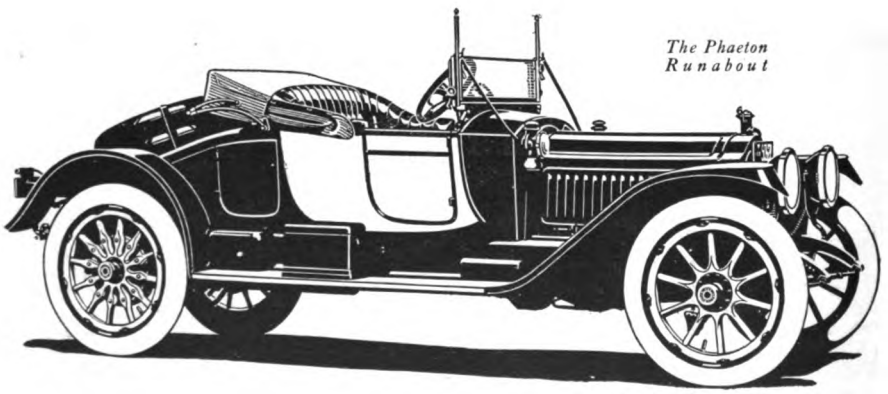
PACKARD SERVICE

The car best able to care for itself is cared for by the best service

Packard service means ability plus willingness to serve. Every Packard owner commands free of charge the services of a technical expert in inspecting his car and making minor adjustments. Packard dealers take the initiative in keeping cars running to the entire satisfaction of their owners.

Each dealer carries a carefully selected line of parts in stock and maintains a service department with all facilities for keeping Packard cars and trucks at their high point of efficiency.



For Packard owners who tour abroad, the Packard Motor Car Company of Paris maintains a complete service depot at No. 5 Rue Newton, Paris.

In all Packard establishments the same consideration is extended to every Packard owner regardless of his place of residence or where he purchased the car.

Packard service follows the car:—one of the reasons why a Packard bought this year will have a higher relative cash value next year or five years hence than any other car purchased at the same time.

For All Metal Automobile Parts Use "Lionoil"—the Perfect Rust Preventive

Rust is the great enemy of metal. Berry Brothers' "Lionoil" is the greatest enemy of rust.

Prudent manufacturers of bodies, springs, frames, axles, fenders, lamps and all sorts of metal stampings and forgings are finding "Lionoil" indispensable as a rust preventive.

A coat of "Lionoil" on metal parts means a smooth, clean surface for painting and finishing.

On parts that have to be stored, a coat of "Lionoil" means absolute protection against weather or dampness in the stock room.

Metal parts coated with "Lionoil" when finished, will show no tendency to peel, check or flake.

"Lionoil" air-dries quickly, spreads over a great deal of surface, is economical to buy. It pays for itself in labor saved and metal preserved.

Let us send you full information regarding "Lionoil."

We also make the Raven line of black Japans for lamps, bonnets, top bows and other parts.

Let our Technical Department help you with your finishing problems. Write for booklet and full information.

BERRY BROTHERS' VARNISHES DETROIT

55 Years' Experience

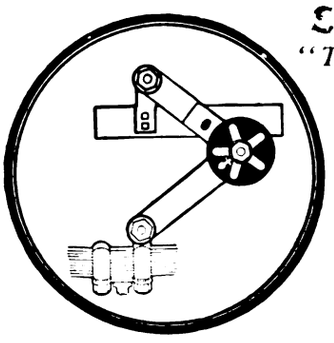
New Truffault-Hartford Shock Absorber has Three Degrees of Friction



Frictional absorption, as first and only employed in the famous Truffault-Hartford Shock Absorber, has been assigned a new application in the New Automatic—the latest Truffault-Hartford model and the last word in scientific shock absorption.

This new model combines *three* distinct degrees of frictional tension, varying in intensity according to the condition of the road surface.

These three degrees are positively automatic, responding so quickly and perfectly to a change in the road surface that the car rides with equally luxurious ease on all roads—rough or smooth.

The first degree of tension, while extremely slight, suffices to destroy the disagreeable spring oscillation generally quite evident in travelling over a smooth road surface at high speed.

A change in the road from smooth to moderately rough, brings the second degree of tension into action and this, while thoroughly successful in preventing any excess action of the springs, does not affect their necessary full range of play.

The third degree serves the dual function of not only insuring the comfort of the car's passengers on abnormally rough roads, but in acting as a sure and effective control for the springs in case of sudden and speedy contact with car tracks, deep ruts, or high bumps frequently seen too late to slow the car down.

The increased comfort which the New Automatic makes possible in the automobile is the nearest approach to riding in a Pullman car over a rock-ballasted railway that the motoring world has ever been offered.

Regardless of its spring equipment—stiff, medium or highly flexible—every car is benefited and made to ride all roads with remarkable ease through the addition of the

Truffault-Hartford
SHOCK ABSORBER
"The Pioneer Shock Absorber"

Unlike many other devices the New Automatic is attached without detriment to the car's appearance. Write for catalogue giving complete information of this and other models.

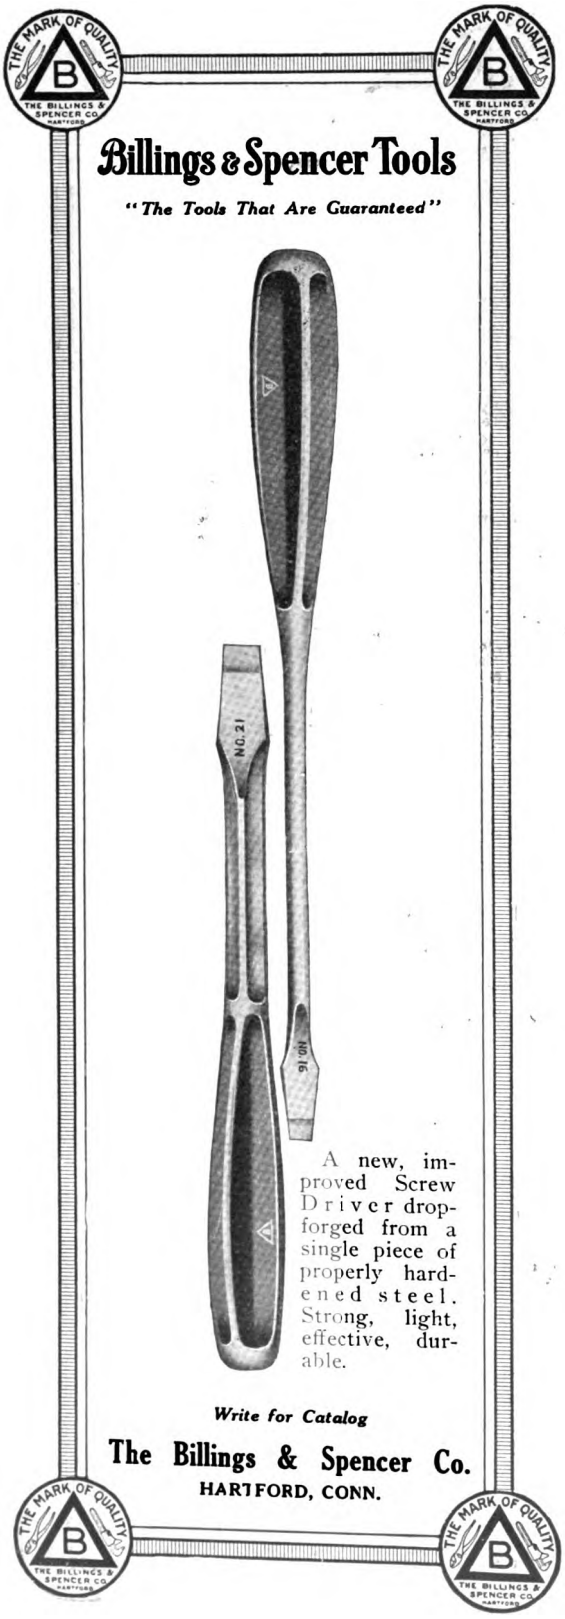
The Significance of
The Latest Firestone Victory

That supreme record test at Indianapolis last Decoration Day, when two nations rode to triumph on Firestone Tires, means far more than confirmation of Firestone leadership.

It proves that endurance can be built into a tire equal to any strain which conditions may bring out. It justifies, also, a world-wide challenge for American ideals of workmanship and quality.



And It Offers a Final Infallible Guide in Tire Selection

2 minus 1 leaves 1, and that is what causes carbon.

1 minus 1 leaves 0, or nothing, and as there is nothing left it cannot collect carbon.

The above is the whole story of the success of MONOGRAM OIL and can be simply explained by saying that practically all other automobile oils are made up of a compound of one very light finished oil and one very heavy finished oil to give the required "body" or viscosity. Neither of them alone would be suitable for the lubrication of the average automobile engine, and when this compounded oil comes in contact with the heat of the explosion in the cylinder, the light weight oil flashes and burns off quickly, leaving the very heavy oil to gum and to collect the road dust which is drawn in through the carburetor and they both bake on the cylinder walls, piston heads, and valves, causing carbon deposits.

On the other hand MONOGRAM OIL is what is known as a "straight run product." That is, the required "body," or viscosity, is obtained in the stills during its course of manufacture, and when this oil comes in contact with the explosion heat it burns or vaporizes off evenly—for the oil is **all** just the same through and through and when it is burned there is nothing left to collect the dust and to form carbon.

This is why MONOGRAM OIL has been continually successful under that one brand name since the very start of the automobile industry.

Overland

The road to sales efficiency

THE fundamentals which make for practical and economical sales efficiency are saleable product—plus a complete and comprehensive organization—plus broad and effective sales, merchandising and advertising methods. The Willys-Overland Company have, beyond doubt, the most complete organization in the industry—and for 1914 it will be made larger.

The Willys-Overland Company conduct the largest and most effective advertising campaign in the industry—and for 1914 it will be made larger.

The Willys-Overland Company have, from year to year, marketed the most saleable and most non-competitive car in the industry—and our 1914 value will be even more unusual in its features and its price than ever before.

The dealer who waits and connects with this 1914 line-up will establish a business and build for himself a future that is profitable, and which is free from the annoyances and disappointments caused by the natural drawbacks of handling a non-staple line.

We announce August sixteenth.

Wait.

Vol. XXXVI New York, U. S. A., Thursday, July 24, 1913 No. 5

J. N. GUNN RELINQUISHES STUDEBAKER MANAGEMENT

His Mission Accomplished, He Returns to His Former Business but Remains a Director — C. H. Booth His Successor.

Having accomplished the purposes he had in view, James Newton Gunn, general manager of the Studebaker Corporation, tendered his resignation at a meeting of the directors held in New York last week. It was accepted but, at the solicitation of the directors, Gunn will remain a member of the board.

The vacancy created by Gunn's resignation was filled by the promotion of Clarence H. Booth, former assistant general manager, who thereby becomes head of the Studebaker automobile division. Booth has been connected with the Studebaker establishment for many years and has served in so many departments that he is familiar with the entire structure.

Gunn was elected a director and general manager of the entire Studebaker Corporation in April of last year, at about the time Walter E. Flanders was preparing to relinquish the management of the automobile division and when his preparations had caused an interesting if not delicate situation.

Gunn is a member of Gunn, Richards & Co., who are efficiency engineers and accountants, and, although he previously had performed special work for the Studebaker Corporation, his entry into it as general manager was wholly unforeshadowed and wholly unexpected.

Gunn was practically unknown to the automobile industry, but after Flanders retired and the kinks had been smoothed out he quickly proved himself a general manager in fact as well as in name. He generally reorganized the Studebaker affairs and restored the esprit de corps, which had been sadly shattered. He built up what amounted to practically a new staff, and although he rarely figured in print, and never posed in the limelight, one of his chief assistants only recently indicated the regard in which he was held by describing him as "one of the most lovable men I have ever known."

Gunn retired from the Studebaker service in order that he may devote more time to Gunn, Richards & Co., who number not a few important clients and whose business is extensive.

Gleason-Peters Takes up Carburetters.

Hereafter the manufacture of carburetters will be combined with the manufacture of air pumps by the Gleason-Peters Air Pump Co., of Brooklyn, N. Y., that well-known company having purchased the business of the Motor Appliance Co. of America, which produced the Maco carburetter. The manufacture of the carburetter already has been taken up at the Gleason-Peters plant at 255 Classon avenue. In the construction of the Maco carburetter there are but two adjustments—one for the gasolene for low speed and one for the air for high speed—and the venturi tube is placed so that a strong vacuum always acts upon it and the fuel therefore is well atomized. The spray nozzle is placed directly in the center of the float chamber so that constant fuel level regardless of the position of the engine is assured. Several styles are made for attachment either from the top or from the side.

The needle valve adjustment is at the top, and the point of the needle, being inserted in the top of the spray nozzle, spreads the gasolene as it is drawn from the nozzle.

Smith Ceases Manufacture of Clutches.

Because of the necessity for more space for the manufacture of its frames and other pressed steel parts, the A. O. Smith Co., of Milwaukee, has transferred the manufacture of the Smith-Mulford disk clutch to the Universal Machinery Co., of Milwaukee. In making the announcement, the Smith company adds that their arrangements are such that the Universal people will produce the clutch under Smith supervision.

BIDWELL, HIS LEAGUE, AND TIRE COMPANY IN A SNARL

His Former Colleagues Accuse Him of Many Offenses—He Goes to Canada and Dodges Appearance in Court in Buffalo.

Alfred C. Bidwell, the one-time Buffalo wall paper hanger who formed the so-called International Automobile League, is among the many whose exact whereabouts is not now known. He is believed to be in Canada; at any rate, he is not in Buffalo, where at least some of his former colleagues are wearing mourning bands as proof of their sorrow which followed close acquaintance with him.

As it is not yet a matter of court record, all that they say of Bidwell cannot be put into print. Most of it forms the basis of an extended communication to the stockholders of the Northland Rubber Co., which was an outgrowth of Bidwell's "league," and if even half of it is true, the wonder is that he has been permitted to go scot free for such a length of time.

The communication makes evident that the "league" and the Northland Rubber Co. have been internally upheaved for many months, and it is alleged that more than a year ago an order for Bidwell's arrest was secured. That difficulty apparently was patched up for it was not until yesterday, 23rd inst., that the matter got into open court.

Yesterday's proceedings took the form of arguments before Justice Laughlin, in the Supreme Court, in Buffalo, on an application of the Northland Rubber Co. for an injunction to restrain Bidwell from circularizing the stockholders of the International Automobile League in an alleged attempt to injure the business of the company. It is charged that Bidwell, calling himself a grievance committee of the league, is sending thousands of circulars from points in Canada in efforts to weaken

Digitized by Google

the standing of the rubber company and its officials.

George C. Riley appeared for the rubber company and Henry W. Killeen for Bidwell, who is admitted to be in Canada, dodging service of an order of arrest secured by James Bendure, consulting engineer of the Northland Rubber Co., in a libel action he has started against Bidwell, whom he charges with attacking his professional reputation. Incidentally, Bendure has secured an attachment tying up $5,913.24 to the credit of Bidwell in the Commonwealth Trust Company.

While the heated debate between Attorneys Killeen and Riley was in progress before Justice Laughlin, Daniel V. Murphy appeared for a stockholder of the International Automobile League, whereupon Riley declared that Murphy had been injected into the case at the last moment merely for the purpose of delay. Murphy emphatically denied the assertion and Justice Laughlin granted his request and adjourned the hearing until Friday morning.

"Why don't you produce Bidwell," asked the court of Attorney Killeen.

"Yes, produce him, and have numerous orders of arrest served," returned the attorney. "I intended to advise him to come to Buffalo, but not knowing how many orders of arrest the Northland Rubber Co. has up its sleeve, it was deemed best for him to stay where he is for the present."

"Oh, I'll stipulate that we have only one order of arrest," responded Riley. "That is, one in our action charging him with violation of contract."

Mr. Riley read affidavits in which he charged that Bidwell knew that injunction proceedings were on, and claimed that he had dodged service of papers in the action while he was at the Elks' convention at Rochester, N. Y., last week; that he had been located later at Niagara Falls, Ont., and that he is having literature printed on the American side of the border and is directing its distribution in an attack on the Rubber company.

Bidwell himself became a bete noir of the automobile trade soon after his so-called "league" was organized. For cutting prices, violating patents, counterfeiting accessories and selling doubtful goods he was repeatedly taken into court, but little things like these did not greatly worry him, for almost invariably he broke out again in some new place, or in the old place, meanwhile painting vivid word pictures which attracted "members" to his "league," and threatening to sue those who dropped out, most of whom failed to notice that the "membership blank" they signed bound them for life, unless they gave 60 days' notice of their intention not to renew their "memberships."

Bidwell made so much easy money by these practices—even 10,000 members at $10 each equals $100,000 per year—that the spirit of frenzied finance seized him and, reaching out for millions, he overreached himself. One of his first steps in that direction was the formation of the International Automobile League Tire & Rubber Co., capitalized at $2,000,000, and just as he graciously permitted his "members" to pay for the privilege of buying his goods, he allowed them to purchase stock in his tire company. It is stated that between 8,000 and 9,000 of them accepted the rare privilege.

Things apparently were coming so easily that Bidwell went first to Canada, where he formed the League of Canadian Automobilists, and later to California, where the Western I. A. L. Purchasing Corporation was organized, both of which seemingly assisted the sale of shares in the tire company.

Almost from the beginning of his career, Motor World repeatedly threw light on the man and his methods and when, in March last, the International Automobile League Tire & Rubber Co. suddenly changed its name to the Northland Rubber Co., and it was discovered that Bidwell had retired from the presidency, the suspicion was formed that "something had happened." Bert L. Jones, who is general manager of the Niagara Gorge Route, succeeded Bidwell as president of the tire company, but when seen by a Motor World man at that time he stated that the change of name was due to the fact that it "conflicted with the League's title," and also because it "simplified matters." He asserted positively that there was no connection between the Northland company and the so-called League except to the extent that Northland tires were sold to the League, but not at special prices.

As a matter of fact, the various practices of which Bidwell is now accused must have been well known to Jones, a committee of stockholders having been appointed more than a year previously to investigate the affairs of the Tire & Rubber company, after Bidwell had refused to give information or to explain why no effort had been made to erect the projected tire factory. It now develops that at the outset Bidwell or his "league" took 51 per cent. of the Tire company's stock under a collusion contract to pay $100,000 therefor, and the manner in which he made use of this stock appears to be the foundation of all the trouble and accusations which followed and which are now in a fair way of being threshed out in court.

Fry Back, Ready to Push Wire Wheels.

Having completed negotiations whereby the Dunlop Wire Wheel Corporation of America, organized in April with 400,000 capital, is to manufacture Dunlop wire wheels in America, Walter L. Fry, president of the new company, returned last week from England, and the American Dunlop corporation expects to be able to fill orders by October 1; Fry's trip to England also included a study of the manufacture of Dunlop wheels in that country in which he was joined by two technical men who probably will be connected with the company which Fry heads.

Arrangements for manufacturing have progressed so far that a factory in New York City has been practically secured, although the location has not yet been made public because certain details have not been consummated.

It will operate more or less indirectly as a licensee of the Rudge-Whitworth company of England, and the exact manner was made plain by Fry upon his return; the Dunlop and Rudge-Whitmorth companies engaged in litigation several years ago which terminated in the English Dunlop company taking out a license under the patents controlled by Rudge-Whitworth. This license permitted the Dunlop company also to enter the American trade and it is now doing this, being heavily interested in the new American Dunlop company.

Studebaker Discontinues More Branches.

The Seattle, Fargo and Washington branches of the Studebaker Corporation have been discontinued. The Seattle territory has been taken over by the Portland branch and the Fargo territory by the Minneapolis branch.

Notes Bring Down a Thomas Relic.

The Thomas Motor Co. of New York, which purchased most of the stock of the E. R. Thomas Motor Car Co., of Buffalo, when it was sold by the receiver in April last, through Adolph Rebadow, filed a voluntary petition in bankruptcy in the Federal court in Buffalo on Tuesday last, 15th inst.

The petition states that the assets are $20,727.76 and the liabilities at $351,211.17. Practically all of the latter consist of two notes payable to Adolph Rebadow and George C. Finley, receivers of the E. R. Thomas Motor Co., for $280,759.01 and $18,896.17, respectively. These notes proved too much of an obstacle to be overcome by the Thomas Motor Co., which, capitalized at $100,000, was formed to sell the Thomas product, although comparatively few were aware of its existence.

FLANDERS ELECTRIC ABOUT TO BECOME "TIFFANYIZED"

Pelletier Aids in Organization of Tiffany Company—Purchases Bankrupt's Machinery but Not Factory.

What was the Flanders electric car is about to become the Tiffany Mignon, made by the Tiffany Electric Car Co., the Flanders machinery and stock having been purchased by E. LeRoy Pelletier and several associates, who have organized the Tiffany company to continue its manufacture under the new name. In addition there will also be made a larger and more expensive car—one in the $3,000 class—which will be styled the Tiffany DeLuxe.

Soon after the failure of the Flanders Mfg. Co., of Pontiac, Mich., in December last, rumors were afloat that Pelletier had his eyes on the electric end of the business, but when he made no bid for it when the Flanders machinery and stock on hand were sold to Harris Bros & Co., the Chicago house wreckers, it was taken for granted that he had abandoned any intentions of the sort he might have possessed. Late last week, however, he purchased the property from the Harrises and proceeded to the formation of the Tiffany Electric Car Co., which probably will be incorporated with an authorized capital of $500,000 and with Pelletier as its president. Its general manager will be Don C. McCord, one-time general manager of the Flanders Mfg. Co., in whose affairs Pelletier himself was quite active. His new enterprise, however, will not interfere with Pelletier's present connection with the Maxwell Motor Co.

The Tiffany interests have not acquired any of the Flanders real estate or factory buildings, on which the Harrises obtained a three months' option. As a matter of fact, the option has been set aside by the court and within six weeks all of the land and buildings will be offered at public auction by the receiver, the Detroit Trust Co.

Rajah and Grossman Again Lock Horns.

Although the Rajah Auto Supply Co., of Bloomfield, N. J., secured an injunction early last year in the United States District Court for the Southern District of New York restraining the Emil Grossman Co., of New York City, from infringing the Rajah spark plug patent, No. 825,856, the Rajah company has deemed it necessary to sue again and filed its action this week in the same court.

The first suit was based upon the manufacture of a completed plug, the Grossman company making the "Red Head" brand, and after the injunction was secured the Rajah company claimed the Grossman company was guilty of contempt of court in marketing a removable porcelain to fit Rajah plugs; it instituted contempt proceedings, but lost out even on an appeal to the United States Circuit Court, the Grossman company contending that it had not intended its porcelains for Rajah plugs.

The present suit alleges infringement of the same patent by the making and selling of the porcelains, which are claimed to be a part of the Rajah patent.

Wisconsin Dealers Form Association.

Growing out of an informal meeting held in Sheboygan several weeks ago, the automobile dealers in the northeastern part of Wisconsin last week organized the Northeast Wisconsin Automobile Dealers' Association, at least 10 cities and towns being represented in the membership. Officers were chosen as follows: Dr. J. A. Crum, president; Charles F. Kade, Sheboygan, first vice-president; F. S. Hoaglin, Oshkosh, second vice-president; F. A. Thom, Oshkosh, secretary; W. C. Van Nelson, Waupaca, treasurer; M. St. John, Green Bay, and F. Mitchell, Fond du Lac, directors. Among other plans, it is the intention of the association to promote an annual show, which will be held successively in each of the more prominent cities represented by the membership.

Universal Salesman Awarded Commissions.

Having secured a verdict of $1,124.18 in the New York City Court against the Universal Motor Truck Co., March 6 of this year, George W. Kayton, a former salesman for that company, seems in a fair way of getting the money; twice beaten in court, the Universal company this week was denied a new trial, although it contended it had discovered collusion between Kayton and his witnesses. Kayton demanded $1,030 as unpaid commissions on the sale of ten trucks to the Commercial Delivery Co., of New York City, which payment was refused on the grounds that the delivery company failed to take the trucks. Kayton contended that this was not his fault.

Lamb Organizes Another Truck Company.

Frank E. Lamb, of Lima, Ohio, who at one time was connected with the Gramm Motor Car Co., has organized the National Motor Truck & Mfg. Co., in Gibsonburg, O., of which he has been elected president and general manager. The other officers are: A. T. Crossett, first vice-president; C. H. Hutchison, second vice-president; John O'Leary, secretary; J. A. Nieset, treasurer. The company is capitalized at $250,000 and will manufacture trucks of 1 and 2½ tons capacity.

WEED ENTERS MANUFACTURE OF TIRE BLOW-OUT REPAIR

Secures Rights Under Patent it Helped Secure for Los Angeles Inventor—Device Utilizes Patch and Mesh of Weed Cross Chains.

Having secured exclusive rights, the Weed Chain Tire Grip Co. is about to market a chain-retained blow-out repair, which is the invention of Timothy C. Dobbins, a Los Angeles inventor; the device consists of a patch which is placed between the inner tube and shoe, over the blow-out, and a series of Weed cross chains, about six in number, placed close together and anchored to brackets which attach to the rim at each side. With this mesh-like chain arrangement holding the repair together several miles can be made, it is stated, without difficulty.

Dobbins's affairs have been handled by the Weed attorneys ever since he made his original application for a patent, April 27, 1911. A revised application was filed September 18, 1911, but interference developed with a device patented by one George B. Shriner; the Weed-Dobbins device won out, however, and was allowed June 24, 1913, under the number 1,065,787. It has been patented in foreign countries, including Belgium, Canada, France and Great Britain, and will be made and marketed under a royalty arrangement by the Weed company.

Lozier Discontinues Two More Branches.

Having already disposed of its branches in New York, Boston and San Francisco, the Lozier Motor Co. has carried still further its policy of discontinuing such establishments, the Chicago and Philadelphia houses having already passed out of the company's hands. The latter has been turned over to the Bigelow-Willey Motor Car Co., which was organized for the purpose, while the Lozier agency in Chicago has been given into the hands of the Bird-Sykes Co.

Champion Cars Locate in Minneapolis.

Although it is stated that the Champion Motor Car Co. has acquired a factory at 14th avenue, northeast, and the Northern Pacific tracks, in Minneapolis, and will be in operation by August 1st, for some inexplicable reason the names of the men concerned with the project have not been permitted to escape. The Champion company, or whoever composed it, intends to manufacture a 50-horsepower six-cylinder car at $2,750, and a 36-horsepower "four" listed at $1,800.

AUTOMOBILE EXPORTS FOR MAY INCREASED $275,000

Total of Cars and Parts, $3,692,700—Gain of 294 per Cent. by Other Countries—Value for Eleven Months $30,816,504.

The exportation of automobiles and allied products during the month of May, 1913, gained by nearly a half million dollars over the exports of the same month of the preceding year, as stated in Motor World of July 3, but statistics which are contained in a more detailed report by the Federal government reveal interesting information as to the destinations of the shipments and the countries which purchased this volume of American products. While cars, parts, engines and tires gained $474,575, cars and parts constitute considerably more than half this increase, the gain in value of these products being $275,108, or 7 per cent. Cars shipped to foreign countries and the non-contiguous American possessions advanced 13 in number, which is slightly less than 1 per cent.

A substantial increase is recorded for a period of 11 months, ending with May, 1913, as compared with 11 months terminating with May, 1912, the advance amounting to $5,551,613, or 22 per cent., in value and 3,563, or 17 per cent., in number. The total for the latter 11-month period is $30,816,504. Also, the average value of cars exported is $55, or 5 per cent., higher in the past May, the values for the two months being, May, 1912, $984; May, 1913, $1,039.

Of the 12 geographic divisions into which the export statisticians divide the world, Other Countries recorded the greatest gain, advancing 237 cars, or 291 per cent., and $211,845, or 294 per cent. Germany, however, was a good second, with an increase of 143 cars, or 292 per cent., and $109,080, or 297 per cent. Asia and Other Oceania increased its American purchases 130 cars, or 86 per cent., and in value by $122,865, or 82 per cent.

Italy, the United Kingdom, Canada, Mexico and British Oceania entered their names in the loss column, something which Canada has not done in some time, it generally ranking among the leaders in buying American cars. Parts gained $88,539, or 20 per cent. Cars shipped to foreign countries gained 27, or .9 per cent., in number and $191,371, or 6.5 per cent., in value, making the combined monetary increase in cars and parts $279,910, or 8 per cent.

Of the four non-contiguous American possessions, the Philippines was the only one to gain, advancing 29 cars, or 108 per cent., and $34,540, or 85 per cent. Hawaii and Porto Rico lost, the former $2,722, or 4 per cent., the latter $37,972, or 60 per cent. The total for the possessions is a decrease of 14 cars, or 11 per cent., and $4,802, or 2.5 per cent.

The figures for engines and tires for the two Mays were: Engines: 1912, 571, $67,627; 1913, 978, $137,793; gains, 407, or 88 per cent., $70,166, or 103 per cent. Tires: 1912, $272,317; 1913, $396,816; gain, $124,499, or 45 per cent. The figures in detail are shown by the subjoined table.

IMPORTING OF MOTOR CARS CONTINUES DOWNWARD PATH

Value of Cars Bought Abroad by America in May Falls Off 31 per Cent. — Italy Only Gainer, While France Loses.

Imports of foreign made automobiles into the United States during the month of May just passed continued to decrease, and while Motor World previously stated that the value of cars and parts fell off by $46,569, the countries which suffered these losses are enumerated in a more detailed government report. The loss of $46,569 represents a decrease of 25 per cent. The decrease in number was 361, or 45 per cent, and the monetary loss in cars alone, $52,022, or 31 per cent.

The only gain in number and value was made by Italy, which increased its sales in America by 3 cars, or 60 per cent., and $11,040, or 109 per cent. France was the heaviest loser, dropping behind its figures for May, 1912, by 24 cars, or 58 per cent., and $46,450, or 48 per cent. The next heaviest decreases were by the United Kingdom and Other Countries. Parts gained $5,453, or 25 per cent. The figures in detail follow:

	May, 1912. Number.	Values.	May, 1913. Number.	Values.
France	41	$95,965	17	$49,515
Germany	5	10,114	8	21,154

The Week's Incorporations

Pontiac, Mich.—Carter Car Co., under Michigan laws; authorized capital, $650,000.

Boonton, N. J.—Estler Garage Co., under New Jersey laws; authorized capital, $100,000; to conduct a garage.

Sioux Falls, S. D.—M. S. Gear Co., under South Dakota laws; authorized capital, $1,000,000; to deal in motor car supplies.

Cleveland, Ohio—Auto Jack Co., under Ohio laws; authorized capital, $10,000. Corporators—O. O. Vrooman, J. C. Logue, C. E. Mellen.

Seattle, Wash.—Service Garage Co., under Washington laws; authorized capital, $2,000. Corporators—L. W. Roe, D. A. Lord and others.

Wilmington, Del.—McCord Automobile Co., under Delaware laws; authorized capital, $500,000. Corporators—H. E. Latter, W. J. Maloney, N. P. Coffin.

Wilmington, Del.—Westchester Engine Co., under Delaware laws; authorized capital, $225,000. Corporators—F. D. Buck, M. L. Horty, G. W. Dillman.

Mayville, Wis.—Badger Auto Co., under Wisconsin laws; authorized capital, $20,000. Corporators—Richard A. Ruedebusch, Fred H. Lang, Antoinette Lang.

Wheeling, W. Va.—Schick Wheel & Tire Co., under West Virginia laws; authorized capital, $150,000; to manufacture and sell automobile tires and wheels.

Seattle, Wash.—Gibbs & Stratton Electric & Garage Co., under Washington laws; authorized capital, $2,000. Corporators—Charles W. Gibbs, Guy C. Stratton.

Toledo, Ohio—Kole Carburetter Co., under Ohio laws; authorized capital, $10,000. Corporators—Jacob Brunn, Francis M. Bostater, E. Edson Butler and others.

Portland, Ind.—Auto Supply Co., under Indiana laws; authorized capital, $10,000; to deal in motor vehicles. Corporators—R. D. Wheat, Nina G. Wheat, F. H. Mark.

Norwich, Conn.—Co-operative Auto Co., under Connecticut laws; authorized capital, $50,000. Corporators—R. J. Jodoin, John A. Allen, John H. Brown, John Quinn.

Carrolton, Ohio—Wood Auto & Machine Co., under Ohio laws; authorized capital, $10,000. Corporators—E. A. Wood, J. P. Monnyhan, E. C. Smith, P. B. Gaines.

Chicago, Ill.—Motor Tire Sales Co., under Illinois laws; authorized capital, $2,500; to deal in motor car accessories. Corporators—Frank Hutchinson, Emma Roesing, Alice S. Dwyer.

Washington, Ind.—City Automobile Co., under Indiana laws; authorized capital, $3,000; to buy and sell motor cars. Corporators—G. H. Greenwood, L. G. Helphenstine, L. A. Kennedy.

Toronto, Can. — Resilient Spring Wheel Co., Ltd., under Ontario laws; authorized capital, $40,000. Corporators—George H. Sedgewick, Austin G. Ross, James Aitchison, and others.

Milwaukee, Wis. — Grove Street Garage Co., under Wisconsin laws; authorized capital, $5,000; to conduct a garage. Corporators—Harry A. Keech, Edmund A. Ringel, Clarence Salenstine.

Cleveland, Ohio—Euclid Auto Livery Co., under Ohio laws; authorized capital, $10,000. Corporators—F. A. Poole, E. L. Lansing, B. J. Peck, William J. Warmington, Theodore Sokoloski.

Chicago Ill.—Jesco Installation Co., under Illinois laws; authorized capital, $4,000; to sell and install motor car accessories. Corporators—Carl V. Richardson, Harry F. Hamlin, Paul W. Gillett.

Orange, Conn.—Cameron Mfg. Co., under Connecticut laws; authorized capital, $1,000 000; to manufacture and deal in motor vehicles and boats. Corporators—Thomas M. Stoele, New Haven, and others.

Hamilton, Ohio—Ohio Mutual Automobile Fire Insurance Association, under Ohio laws; to insure members of said association against loss by fire, lightning or explosions from gas, or motor cars, motor trucks, etc.

Newark, N. J.—Acetylene Welding Co., under New Jersey laws; authorized capital, $50,000; to manufacture steel, copper, etc. Corporators—I. Boursonville, C. Boursonville, L. Lorenweticz, J. Lorenweticz, all of Newark.

New York, N. Y.—McNutt Can Co., under New York laws; authorized capital, $500,000; to manufacture and sell safety gasolene cans. Corporators—W. H. McNutt, J. F. Pierson, Jr., C. E. Rell, all of New York City.

Fairfield, Me.—Eastman Transportation Co., under Maine laws; authorized capital, $10,000; to own and operate motor cars and motor trucks. Corporators—A. F. Smith, Waterville; A. A. Eastman, J. M. Eastman, both of Benton, and others.

Brooklyn, N. Y.—E. A. Laboratories, under New York laws; authorized capital, $100,000; to manufacture motor car accessories, etc. Corporators—Emanuel Aufiero, 627 Kent avenue; Michael Aufiero and Daisy Aufiero, both of 185 Hewes street.

New York, N. Y.—Fred W. Young Co., under New York laws; authorized capital, $15,000; to repair motor cars, etc. Corporators—William J. Cahill, 871 Eighth avenue; Frederick W. Young and Arthur E. Brautigan, both of 242 West 56th street.

New York, N. Y.—Le Compte Cycle Car Corporation, under New York laws; authorized capital, $60,000; to deal in motor cars and cyclecars. Corporators—H. R. Buckingham, 37 Wall street; L. S. Higgins and Godfrey Goldmark, both of 32 Liberty street.

New York, N. Y. — Hayes-Diefenderfer Co., under New York laws; authorized capital, $10,000; to deal in motor cars and parts. Corporators—Alfred J. Diefenderfer, Bronxville; Edward Hayes, 1224 Pacific street, Brooklyn; Lee W. Bennett, 511 West 143rd street.

Buffalo, N. Y.—Steinbrenner Carburetter Co., under New York laws; authorized capital, $100,000; to manufacture carburetters. Corporators—William J. Steinbrenner, 107 Victoria street; John M. Hoen, 598 Ellicott square; James T. Briscoll, 690 Ellicott square.

New York, N. Y.—Michigan Motor Car Co. of New York, under New York laws; authorized capital, $31,500; to deal in motor cars. Corporators—Kenton Harman, 106 Morningside avenue; James A. Murphy, 435 West 45th street; C. Anthony Wolfe, Northport.

Middletown, N. Y.—Talking Horn Co., under New York laws; authorized capital, $10,000; to manufacture automobile and bicycle horns. Corporators—Nichol C. Oddo, 116 North street; Thomas N. Bingham, 5 Royes avenue; Floyd W. Morgans, 50 Hanford street.

Brooklyn, N. Y.—Vacuum Tire Corporation, under New York laws; authorized capital, $50,000; to manufacture and deal in automobile tires and accessories. Cor-

Digitized by Google

porators—Willard J. Woodcock, 102 Gates avenue; Charles G. Ross, 66 Hancock street; Frederick L. B. Gartner, 150 Classon avenue.

Stamford, Conn.—North Stamford Avenue & Long Ridge Road Auto Bus Co., under Connecticut laws; authorized capital, $10,000; to operate a motor bus line. Corporators—Martin J. Potter, James F. Dunn, Henry Miller, Gutzon Berglum, Charles J. Weinz, Walter P. Terry, C. F. Waterbury.

New York, N. Y.—Vanden Plas of America, under New York laws; authorized capital, $10,000; to manufacture and deal in motor car bodies, accessories, etc. Corporators—Lignello Perera, 69 Wall street; A. Vanden Plas, 32 Rue St. Michel, Brussels, Belgium; Walter S. Newhouse, 37 Liberty street.

Minor Business Troubles.

Mercer W. Christian, trading in Richmond, Va., at 11 West Main street, as the Jefferson Garage, has filed a petition in bankruptcy; he states that his liabilities are $2,284.42. Among the larger creditors are: Alsop Motor Car Co., $200; S. F. Bowser & Co., $220; W. M. Batten, $272.

Upon the application of creditors, a receiver has been appointed in the Municipal Court in Cleveland, Ohio, for the John M. Rauch Motor Sales Co., of that city. Rauch, a former Sunday school superintendent, has been in the workhouse for some time following his conviction on the charge of contributing to the delinquency of a girl.

A petition in bankruptcy has been filed in the Federal court against the Bruns Auto Co., of Brooklyn, N. Y., Chalmers subdealer until last spring, when Carl H. Page & Co., the Chalmers representative in New York and the metropolitan district, opened a branch of its own house in that borough. The petition alleges that there are liabilities of $5,000 and assets of but $3,000. The petitioning creditors and their claims are: New York Lubricating Oil Co., $202.58; P. J. Collison & Co., $48; Walter E. Fleming, $250, for money loaned. Samuel Rodeman, who owns the building at Atlantic and New York avenue where the company maintained a service station, has incurred the displeasure of the court by locking out a city marshall who was guarding the property.

Recent Losses by Fire.

Fresno, Cal.—Waterman's Garage, destroyed. Loss not stated.

Austin, Minn.—Moreland & Anker, Main street, garage damaged. Loss not stated.

Michigan City, Ind.—Parker & Haskell Car Co., plant destroyed. Loss not stated.

Springfield, Mass.—Bay State Storage Garage, Liberty street, damaged. Loss, $20,000.

CHRISTMAS COVE, HAVEN FOR THE CHAMBER OF COMMERCE

Manager Miles Leads Directors, and Others, Far From New York's Roar—Pleasure Crowds Business Into a Corner.

Following the precedent established last year, the board of directors of the Automobile Chamber of Commerce held its regular July meeting far from the madding throng and the roar of 42nd street, New York. Instead it went to Maine, where only the ocean roars; that is to say, to Christmas Grove, where is located Manager Miles's country home, which is the sort of home possessed by few men in the automobile business.

Following last year's precedent, the Chamber's meeting was of unusual length; it occupied all of three days and part of another one, but also following precedent, the board of directors engaged in a minimum of work and a maximum of play. If it were tabulated, the schedule of the four days would read about like this: Wednesday evening, arrive; Thursday, fishing excursion; Friday, rain, and a very routine business meeting, also some other things out of the routine; Saturday afternoon, clambake; Saturday night, dinner party in honor of S. D. Garden, the Pierce-Arrow agent in New York and one of Host Miles's oldest and most intimate friends.

Since last year's session, Miles had discovered where mint juleps are grown and when he led his guests to them it is said nothing caused more profound amazement.

While nominally a meeting of the directors of the Chamber of Commerce, Miles's guests included several prominent members of the accessory trade and a number of personal friends. The Chamber of Commerce directors who were present were President Clifton, H. H. Rice, L. H. Kittredge, R. D. Chapin, Windsor T. White and W. E. Metzger. H. A. Bonnell, assistant manager of the Chamber, and A. L. Primble and Harry Fay, of the office staff, were also in attendance. The accessory contingent was made up of J. H. Foster, president of the Motor and Accessory Manufacturers, and C. E. Thompson, Alfred Reeves, D. J. Post and T. J. Wetzel. W. A. Redding, the Chamber's patent counsel, and R. D. Garden made up the remainder of the party.

Changes Among Prominent Tradesmen.

J. P. Nicholson, former district representative of the Service Motor Car Co., of Wabash, Ind., has been promoted to the management of the Chicago branch which just has been opened in that city. It is located at 1631-1633 Michigan avenue.

C. H. Snoke has been appointed sales manager of the Studebaker Corporation of Canada, Ltd., which is located in Walkerville, Ont. He succeeds Frank E. Fischer, resigned. Snoke, who has been in the Studebaker employ for 18 years, has served in many capacities, latterly as branch manager in Seattle, Wash.

To fill the vacancy caused by the mysterious disappearance, several months since, of J. Walton Lyman, which mystery remains unsolved, B. C. Swinehart has been appointed manager of the Philadelphia branch of the Republic Rubber Co. He previously had charge of the Republic establishment in Cleveland, where he has been succeeded by G. N. Talcott, formerly identified with the Republic branch in Atlanta, Ga.

General Motors' Action Divides Owosso.

Not all of the residents of Owosso, Mich., have taken kindly to the action of the General Motors Co. in closing its truck factory in that little city. In fact, two of them feel so strongly on the subject that they have asked the city council to bring suit against the General Motors interests to recover the property which was turned over to them in consideration of their locating their factory in Owosso. On the other hand, the Owosso Improvement Association has passed a resolution deploring such action on the part of their two fellow citizens, having received assurances that the factory will be reopened and occupied by another department of the General Motors organization and the contract with the city of Owosso will be otherwise fulfilled.

Removal Fails to Save Lansden.

The Lansden Co., which only about three months ago removed from Newark, N. J., to Allentown, Pa., has gone the way of the Webb Co., of Allentown, which also was one of the Mack brothers' properties: that is to say, the Lansden Co. is in the hands of a receiver. The man whom the court designated to fill that office is Morton E. Kern, who became general manager of the Lansden Co. when it removed to Allentown. The creditors allege that the company, which made electric vehicles, is insolvent.

Possible Intentions of Big Company.

Press despatches from Butler, Pa., report that it is "unofficially announced" that the new mill being erected by the Standard Steel Car Co., adjacent to its plant in that city, is designed for automobile manufacture; it is stated that the new factory will occupy several acres. Motor World's inquiry to the Standard Steel Car Co. itself, however, has failed to bring a response.

In the RETAIL WORLD

A garage is to be erected in Ogden, Utah, by J. G. Ellis.

Charles E. Pickett, of Waterloo, Ia., plans to build a new garage.

The Kendall Auto Co., of Pasadena, Cal., is erecting a new garage.

The Greyhound Garage in Warsaw, Ind., has been sold to Hayes, Bros.

Herrick & Stoltey have opened a garage and repair shop in Champaign, Ill.

Daniel Roberts Harper will erect a garage on North Broad street, Philadelphia, Pa.

R. C. Manning has opened the Motor Shop on East State street, Trenton, N. J.

The Automobile Supply Co., of Rome, Ga., has opened a garage on Broad street.

The West Reading Motor & Hardware Co. has been formed in that Reading (Pa.) suburb.

A new garage is to be erected in La Porte, Ia., by the Hilmer Shull Auto & Supply Co.

James Callegaris, of Waterbury, Conn., is erecting a grage; it will stand on Frederick street.

Frank Kunkel will open an automobile repair shop on West Fayette avenue, Effingham, Ill.

Wisely & Shortt have opened a garage on Dingan street, West New Brighton, Staten Island, N. Y.

The Miles Standish Auto Co., of Oakland, Cal., will open a garage on 22nd street, Richmond, Cal.

Mrs. F. Morgan, of East Oak street, Globe, Ariz., has taken the agency for Studebaker cars.

E. B. Stimson has organized the Stimson Automobile Co. in Minneapolis. He will handle the Wahl car.

Herring & Co. of Mansfield, Ohio, have commenced the erection of a garage on South Walnut street.

William Schropp has purchased J. B. Lewis's half interest in his garage business in Washington, Kan.

A five-story garage is to be erected on East Second street, New York, for the Philip Weeks Estate.

Capt. Daniel McElroy is erecting a garage in Newark, N. J., at 628 Newark avenue; his son will operate it.

The El Camino Real Garage, Santa Barbara, Cal., is to be enlarged by an addition which will cost $21,500.

The Bechler & Ogden Motor Co., of Baltimore, Md., which handles Krit cars, has opened a service station.

E. Levene, of Philadelphia, Pa., has secured plans for a two-story garage; he will build on Diamond street.

D. O. Dotson has purchased F. D. West's interest in a garage in Kinsley, Kan., and will continue the business.

The Torkelson Carriage Co., of 414 Selby avenue, St. Paul, Minn., has taken the agency for the Moline car.

The Peerless Motor Car Co., of Philadelphia, Pa., is erecting a new building; the site is on Chestnut street.

The Ocean Boulevard Garage, Neversink, N. J., has built an addition to its garage to be used as a repair-shop.

Twin Light Garage is the style of a new business in East Gloucester, Mass. It is located on East Main street.

W. C. Bartlett's Forest Park Garage in Dickinson street, Springfield, Mass., has been enlarged and improved.

Charles Marks is to have charge of a garage that is being erected in Wormlesburg, Pa., for Jacob H. Mays.

The Wholesale Automobile Corporation has entered the trade in San Francisco; it is located on Van Ness avenue.

L. F. Hersh & Bro., of Newark, N. J., are about to erect a large fireproof garage; the site is on North Broad street.

J. J. Quinn, formerly a dealer in Minneapolis, Minn., has reentered the trade in Seattle; he has the Michigan agency.

The Bagnell Automobile Co., of 4160 Olive street, St. Louis, Mo., has changed its corporate name to the Cole Motor Co.

J. W. Moore has taken the agency for Marion cars for the State of Alabama and will locate on 20th street, Birmingham, Ala.

Thomas Evans, of Bloomington, Ill., has arranged for the erection of a garage on Main street. Work will be commenced at once.

The W. S. Williams Auto Sales Co. has opened up in Oshkosh, Wis. It has a three-story building at Otter and State streets.

John P. Barnett, Jr., has opened a new garage in Suffield, Conn., on Main street; formerly he ran a garage in West Suffield, in the same State.

The Harvard Building Co., of Seattle, Wash., will erect a large building on Pike street, to be used for automobile business. It will cost $80,000.

The D. K. S. Auto Supply Co., of Cape May, N. J., is building a garage which is nearing completion. The company has the agency for Ford cars.

The Turnbull Auto Co., of Willimantic and Norwich, Conn., has disposed of its Willimantic business to W. R. Frisbie, of Norwich; he will operate it.

N. B. Tilden & Sons have purchased the garage formerly operated by R. P. Cassill at 1660 Highland avenue, Hollywood, Cal., and will continue the business.

The Lincoln Motor Car Co., of Los Angeles, is about to open a new service station; space for this purpose has been secured in a Van Ness avenue building.

The Boochier & Ogden Motor Co., of Baltimore, Md., has opened a new service station on Highland avenue; L. D. Thompson is manager. The company is a Krit dealer.

The Badger Auto Co. has been formed in Mayville, Wis., by Richard A. Ruedebusch, Fred J. Lang and Antoinette Lang, with a capital of $20,000; the company will erect and operate a garage.

The Palmer Hardware Co., of Mammoth Spring, Ark., is about to enter the trade. A two-story garage is being erected and the company will stock a full line of accessories and Michigan and Ford cars.

J. A. Trow, of Canal Dover, has sold his garage on Wooster street to E. H. Zoller and Fred Potschnor. Trow will continue to manage the business, but the name will be the Dover Garage Co. Ford cars will be handled.

A garage and sales building is being erected in Paterson, N. J., on Ellison street. When completed it will be occupied by the Hackett Motor Car Co. and Fuller's Express Co. It will represent an expenditure of $10,000.

F. L. Fosha has disposed of his interest in the Washington Street Garage in Green

Digitized by Google

Bay, Wis. His partner, L. P. Larson, will continue the business. Fosha has returned to a position as railroad engineer, his former occupation.

The Grove Street Garage Co. has been organized in Milwaukee, Wis., by Harry H. Keech, Edmund A. Ringel and Clarence Salenstine, with a capital of $5,000. Keech formerly operated a garage in that city on National avenue, near 11th avenue.

E. Van Benscheten, for several years Detroiter distributer in Clyde, Ohio, has opened salesrooms in Toledo, Ohio, in the Meredith building, at Jefferson and Michigan avenues. He will distribute Detroiter cars in both his new and old locations.

P. P. Bishop and C. A. Schmidt have taken over the garage formerly operated in Dubuque, Ia., by the Dubuque Auto & Garage Co., at 6th and Iowa streets; the building will be enlarged and remodeled and White and Overland cars will be stocked.

William H. Baxter, who formerly conducted a garage in Springfield, Mass., at 163 Dwight street, has taken possession of a new building, 100 x 110 feet, at Oak and State streets. The garage is the largest in the city. Baxter is dealer in Paige-Detroit and Marion cars and Federal trucks.

On August 1st, John A. Hamilton, for many years manager of the accessory department of the Gibbes Machinery Co., of Columbia, S. C., will take over the accessory jobbing business of that company and continue it at 1216 Main street in Columbia. He will conduct it in his own name.

Arthur C. Brady, who with A. T. Murray formed the Brady-Murray Motors Corporation in March to handle the Chandler car in the metropolitan district, has withdrawn from the management of the company; both men were formerly connected with the factory of the International Motor Co. at Allentown, Pa.

Having passed successfully through a probationary period of 60 days, the clearing house of the Fresno (Cal.) Automobile Dealers' Association has been made permanent. N. R. Cooper has been made permanent secretary and treasurer, succeeding E. W. Johnson and Theodore Sheldon, who held these respective offices.

R. C. McClay and G. A. Howard, of Los Angeles, have combined parts of their names in a new business which will be styled Claward Company's Garage. The building, which is being erected at 645 South Hope street, will be 80 x 150 feet with a 12-foot truss roof. McClay has been connected with the Pierce-Arrow agency in that city.

A. H. Collins and D. E. Wells have formed the State Automobile Co. in Detroit, Mich., and have located at 603 Woodward avenue; they will distribute R. C. H. cars in Northern Indiana and Lower Michigan. Collins formerly was Western and Southern sales manager for the Herreshoff Motor Co., of Detroit, and prior to that managed the Staver racing teams. Wells will do territorial work for the new organization.

$30,000 Damages for Hartford Suspension

The Hartford Suspension Co., of Jersey City, N. J., has been awarded $30,572.76 damages by the master, Henry D. Oliphant, who was appointed by the United States District Court for the District of New Jersey to determine to what extent the Hartford company had been damaged by the infringement of its shock absorber patent by the Westen Mfg. Co., of Newark, in the same State. The patent is reissue No. 12,437, granted January 16, 1906, of which the original, No. 695,508, was issued March 18, 1902, and the Hartford company charged that the Westen company infringed with a shock absorber it manufactured. The suit was won by the complainant in the United States District Court and the decision was affirmed in February, 1912, by the United States Circuit Court of Appeals, to which the Westen company took the case. Following this affirmance, the lower court proceeded to ascertain the damages sustained, and the Hartford company is now entitled to collect the amount named.

Whitney Again to Enlarge Plant.

Although the Whitney Mfg. Co., of Hartford, Conn., only recently completed a two-story, 50 x 180 feet, addition to its plant, which now is being equipped with machinery, it is again preparing to enlarge its factory. The newest addition will be a four-story concrete structure, 60 x 112 feet, affording 26,880 square feet of floor space.

Incidentally, the Whitney company has disposed of its 20-inch water tool grinder business to the Taylor & Fenn Co., of Hartford, and hereafter will devote itself entirely to the production of chains, Woodruff keys and cutters and hand-feed milling machines.

Cincinnati Club "Going Into" Accessories.

Following the example of clubs in New York, Philadelphia and elsewhere, the Cincinnati Automobile Club is preparing to open a supply and accessory depot for the exclusive benefit of its members. L. S. Colter, the secretary of the club, has been authorized to carry out the project, which probably will be in full operation by September 1st.

Prest-o-ceal Makes Appearance in East.

For the purpose of marketing Prest-o-ceal, a new puncture closing compound made by the American Mfg. & Distributing Co., of Louisville, Ky., the Manhattan Accessories & Distributing Co. has been organized in New York with Hugh G. Morrow as its general manager. It has opened offices in the United States Rubber Building, at Broadway and 58th street. Prest-o-ceal is not a tire filler but a vegetable compound which is inserted in the tire and fills about six per cent. of the air space and automatically seals punctures when they occur.

Ward Leonard to Triple its Capacity.

To cope with the steadily increasing demand for its electric lighting and engine starting equipment, the Ward Leonard Electric Co., of Bronxville, N. Y., has well under way an enlargement of its factory which will permit the trebling of its present output. The addition, which is now nearing completion, will also relieve the congestion of the Ward Leonard installation department, which has been sorely taxed because of the accessibility of the factory to New York City.

Nichols to Manage Knight Tire Branch.

J. C. Nichols, president of the General Automobile Supply Co., of New York, who has had the metropolitan agency for Knight tires, has, with principals of the Knight Tire & Rubber Co., of Canton, Ohio, organized the Knight Tire Co. of New York, which will become practically a factory branch with Nichols as manager. It will locate on 52nd street, near Broadway.

Adamson Secures Preliminary Injunction.

Judge Anderson, sitting in the United States District Court in Indianapolis, has granted a preliminary injunction to the Adamson Mfg. Co., of East Palestine, Ohio, restraining the Marshall Iron Works from making, selling or in any other way infringing the patents covering the Adamson portable vulcanizer; the device is covered by patent No. 1,057,911.

Steenstrup to Return to the East.

Peter S. Steenstrup, at one time prominently identified with the Hyatt Roller Bearing Co. and who also served as secretary of the Motor & Accessory Manufacturers, is preparing to again take up permanent residence in the East. Some three years since he removed to the Pacific Coast, where he since has engaged in the accessory trade.

To Make Spark Plug Testers in Seattle.

Harry Dalitz and Arthur Henrich have organized the Dalitz Mfg. & Sales Co. in Seattle, Wash., for the purpose of manufacturing and marketing a spark plug tester invented by Dalitz. They have established a shop at 803 Union street, in Seattle.

NEED FOR PROPER SPEEDOMETER DRIVES.

With the present tendency of manufacturers to send their cars from the factory completely equipped with all the necessary fittings that not so long ago were regarded by everyone as extras, and as such were paid for, it is perhaps surprising that no greater attention has been paid to the desirability of some form of standard speedometer drive mounting.

To attach a speedometer to be driven from one of the front wheels is beautifully simple, requiring as it does merely that a bracket be clamped to one of the steering knuckles and a ring gear screwed to the wheel. But at best it provides a drive that is painfully open to abuse and to dirt; a flying stone, or a small stick caught between the gears is quite likely to put the apparatus out of business. Again, it has been demonstrated on several occasions that even slight bouncing of the front wheel which is likely to take place at anything greater than moderate speed is bound to have a bad effect on the accuracy of the instrument. All of which is second to the consideration that the driving shaft—an expensive piece of work—is quite unprotected and is liable, particularly when the wheels are turned, to come in contact with the tires and be damaged.

To be valuable, it is obvious that a speedometer must be accurate, and the wonder is that so many of them really are accurate in spite of the obsolete manner in which they are driven. For accuracy—not merely momentary accuracy, but accuracy that is continued during the life of the instrument—it is essential that the driving gear and the driving shaft be protected, and one very good way to protect these parts is to take the drive off the propeller shaft or through the gearset. Already several manufacturers have realized this fact and have acted accordingly, and it is not too much to hope that others, too, will see the light, for their own good as much as for the benefit of those who use their cars.

THE VALUE OF KEEPING PROMISES.

Although the value of keeping business promises, and promises of all other sorts, for that matter, is well known and has been remarked times without number, it appears not yet to have been generally appreciated by all of those engaged in the automobile industry.

There probably is nothing which roils a patron, or an intending patron, more than failure to keep promises, whether it be in the delivery of a new car or in the completion of a repaired car; it is not uncommon for such patrons to be put off from day to day with excuses of one sort or another, and like as not the excuse is not offered until the patron calls for his car only to be disappointed.

Of course it is a very human desire to "make customers feel good," but in the effort to do so the very opposite result often is attained. The solution, however, is comparatively easy, although many men seem unable to realize it. In the first place, no promise should be made which cannot be kept, and in the second place when, through unavoidable causes, delays occur that render it impossible for promises to be adhered to, nothing is easier than to resort to the telephone and explain matters.

When originally he does not promise too much, the chief mistake made by the average dealer is to wait until customers call, when the burden of excuse-making is made doubly disagreeable. With a comparatively simple solution always within grasp, it is remarkable that so many merchants do not make use of it.

USEFULNESS OF THE BUMPER.

In the seeking for new equipment and more of it, it is not strange that some of the automobile manufacturers have turned to the bumper. While not absolutely indispensable, it is a highly desirable fixture to have attached to the front of a car, and, parenthetically, it serves useful purposes when attached to the rear.

In the customary place, however, its usefulness is undoubted. It is not so much that it saves lamps and fenders as that it protects the radiator, which is so very vulnerable as to require protection. Quite apart from damage to lamps and radiators, it should be borne in mind, as Motor World pointed out many months ago, that such damage usually is too small to be covered by the $25 insurance limit and as a result such losses are complete.

The suggestion, therefore, is plain that when car makers do not equip with bumpers, it is good business on the part of dealers to prosecute their sale. Few accessories offer more effective selling argument.

PARCEL POST TO CARRY 20 POUNDS AFTER AUGUST 15

Postmaster General Promulgates New Regulations and Rates — Other Popular Changes Likely—Senate Questions Authority.

With the object of making the Parcel Post of still greater advantage to its users, the maximum parcel weight has been increased from 11 to 20 pounds, and other changes have been inaugurated by Postmaster General Burleson in an order which will become effective August 15; the changes include several alterations in zones and reductions in rates, and while they are but a part of the government's cautious procedure in increasing the parcel post facilities, many more are contemplated. In fact, the Postmaster General states that he expects that within 15 or 20 years the postal department will handle practically all of the small parcel business and that the weight limit will reach 100 pounds.

"In the making of extensions and reductions of rates it is necessary for us to proceed with caution," said Postmaster General Burleson, "so as to afford ample opportunity to prepare for the increased business. For that reason we have made the changes proposed apply only to the first and second zones. I appreciate fully the sentiment for an increase in the weight limit and a reduction in rates to all zones, but it is necessary for us, in a sense, to feel our way."

Mr. Burleson announced the changes as follows: "The first zone shall include the territory within the local delivery of any office, and the first zone rate of postage will apply to all parcel post mail deposited at any office for local delivery, or for delivery by city carrier, or on rural routes emanating from that post office.

"The second zone shall include the remainder of what is now the first zone, together with the present second zone, and shall include all the units of area located in whole or in part within a radius of approximately 150 miles from any given postoffice.

"The rate of postage on parcels weighing in excess of four ounces in the proposed first zone will be reduced from 5 cents for the first pound and 1 cent for each additional pound or fraction thereof to 5 cents for the first pound and 1 cent for each additional two pounds or fraction thereof, and the rate for the second zone will be reduced from 5 cents for the first pound and 3 cents for each additional pound, or 6 cents for the first pound and 4 cents for each additional pound or fraction thereof, to 5 cents for the first pound and 1 cent for each additional pound or fraction thereof.

"The maximum weight of parcel post packages will be increased from 11 pounds to 20 pounds, the increase of weight to apply only to the first and second zones. No change has been made in the size or form of the package."

Statistics collected by the department show that quite one-third of the total number of parcels mailed are handled within the proposed first and second zones, and the Postmaster General believes the increase in the weight limit and the reduction of the rates of postage in the first and second zones, as proposed, will benefit greatly more than one-third of the public; and that the producer, the consumer and the local merchant will profit materially by the changes.

At the outset it was estimated that 300,000,000 parcels would be handled during the first year of the operation of the parcel post system, but it now appears from the statistics that, influenced by the changes proposed yesterday, the service will be so popularized that the number of parcels carried during the ensuing 12 months will be more than double the original estimate.

The rate sheet, which is to be used as a substitute for the parcel post map, will be prepared as soon as practicable and attached to the parcel post guide. The rate chart, to be made for each separate postoffice, will be worked out from the focal point of the unit in which the postoffice is located. The simplicity of the plan, it is thought, will make easily determinable the rate of postage from that unit to any other on any mailable parcel, and will greatly facilitate the handling of parcel post matter at post office windows.

The insurance fee, which originally was 10 cents, was found to be excessive, and an order, effective July 1, reduced to 5 cents the fee on parcels insured to actual value up to $25; and a 10-cent fee is exacted only on parcels insured to actual value of more than $25 and not exceeding $50.

After the new rates were announced the Post Office Committee of the Senate questioned the authority of the Postmaster General to make the changes, and he has been directed to appear before the committee at a meeting to be held to-day, 24th inst., to explain his authority. The committee appears to hold the belief that Congress should make or at least confirm such action.

Firestone Offering Road Signs Free.

It will not be the fault of the Firestone Tire & Rubber Co. if every dealer in the land does not post the roads with his advertisements, for the Firestone company is now offering the necessary signs to all Firestone dealers, absolutely free of charge. They are given the choice of imprinted metal or muslin road signs.

WINS NATIONAL TOUR WITH FOUR-YEAR-OLD LOCOMOBILE

For the First Time, Private Owner is Awarded Principal Prize—Glidden Team Trophy Goes to the Boston Metz Team.

For the first time in the long history of the Glidden tour and the much shorter history of the American Automobile Association National Reliability Tour, the name of a sure-enough amateur driver at the wheel of a privately owned and privataely entered car will be inscribed on the chief trophy.

NOONDAY STOP OF THE A. A. A. RELIABILITY TOURISTS

Driving a Locomobile touring car of the vintage of 1909 that already had seen 100,000 miles before it was entered for the 1,300-mile jaunt from Minneapolis to Glacier National Park, Dr. J. D. Park, who is vice-president of the Duluth Automobile Association, won in the touring car class with a perfect score and was awarded the A. A. A. trophy. To the team of three little Metz cars representing Boston and driven by G. H. Voter, Charles and G. W. Metz, fell the famous Glidden trophy for the best team performance. The Anderson trophy for the best individual performance in the roadster class was awarded to R. W. Munzer and his Hupmobile, who, with the three Metz drivers, the Northwestern Automobile Co.'s Krit, and the other Hupmobile driver, finished with a clean score and drew lots for the prize. The same drivers drew lots for a trophy offered by the Minneapolis News, which was won by G. H. Voter. The tour was brought to an end on Saturday last, the final scores being as follows and 1,000 representing a perfect record:

No.	Entrant and car.	Score.
5	G. H. Voter, Metz	1,000
6	Chas. Metz, Metz	1,000
7	G. W. Metz, Metz	1,000
10	Northwestern Auto Co., Krit	1,000
14	R. W. Munzer, Hupmobile	1,000
15	R. W. Munzer, Hupmobile	1,000
17	E. B. Stimson, Chalmers	1,000
20	E. A. Everitt, Locomobile	1,000
4	L. H. Fawkes, Premier	995
8	Northwestern Auto Co., Krit	992
12	L. C. Erbes, Velie	980
21	F. J. Lyman, Maxwell	930
11	Dr. C. A. Smith, Kissel	858
16	J. A. O'Brien, Little	827
18	Dr. F. W. Humphries, Locomobile	620
9	Northwestern Auto Co., Krit	430
19	L. C. Newlon, Chalmers	Withdrawn
2	L. H. Fawkes, Marmon	Withdrawn
3	H. F. Legg, Stutz	Withdrawn

Although the victory of the Metz team in the roadster class might have been foreseen, for all of the little cars early demonstrated their ability to negotiate the roads and to accept punishment with less effect (on scores) than could many of the larger and heavier cars, Dr. Park's victory in the touring class was almost a complete surprise, and to those who have watched the progress of previous Glidden tours it must have been a welcome one. Considering the age of the Locomobile he drove—it is a chain-driven car—and the fact that he had pitted against him cars newer by several years, and in the hands of professional drivers, his performance is nothing short of remarkable. Because of his steady, consistent driving he attracted no attention to himself, and it is altogether likely that those who drove against him never considered him as a serious contender.

All told, but eight of the original 19 starters pulled into Glacier Park with scores unblemished and of the remaining machines one was withdrawn shortly after leaving Devil's Lake on the fourth day and two more were withdrawn before the finish line was reached, leaving only 17 to check in. Shortly after leaving Glasgow, and while traveling at fairly high speed, the Stutz driven by N. F. Legg rammed the bottom of its crankcase against a sharp rock in the roadway and came out of the encounter very much the worse; the car was shipped back to Minneapolis. After leaving Wellington, N. D., Fawkes burned out the clutch in his Marmon and withdrew.

The run from Minot, N. D., where the tourists rested over night on Tuesday, 15th, to Williston, in the same State, which was the route covered on the sixth day, was the shortest negotiated during the whole of the trip, and the dusty drivers rolled off the 135 miles in good time. The bright sunlight caused both drivers and passengers a great deal of discomfort, and when the caravan pulled into the night control most of them presented curious spectacles, for with few exceptions they had tied handkerchiefs over their faces, and those who had not done so were covered with layers of cold cream and dust. For more than an hour the trail was lost by the pacemaker, and a dozen of the cars, and it was only after much circling around among abandoned roads and gullies that the confetti trail again was picked up. Despite the shortness of the run, Dr. C. A. Smith, who drove a Kissel, found it impossible to keep up with the schedule because of a leaking radiator, and he was penalized 120 points for getting in late. Clarence Munzer, who drove one of the Hupmobile entries, also had a close shave, but saved himself from penalization by a margin of 10 seconds; he had four blow-outs on the road and finished on a rim.

From Williston to Glasgow, Mont., slightly better roads were encountered and a little rain during the night had laid the dust; as a result, all of the cars checked in on time, or, rather, considerably ahead of time, for the 164-mile run was made in fast time. It was during this part of the run that Fawkes's Marmon, which up to that time had run with a perfect score, burned out its clutch bearings and was forced to retire. A little further on the Mitchell "six" pacemaker shattered a steering knuckle. Luckily, however, the hotel train passed in full view of the accident and the Vulcan welding representatives soon patched up the knuckle and sent the car on its way.

During the morning run over the Montana plains dust was terrific, and on several occasions those who followed the pacemaker had nothing to guide them but his dust. Only once during the day were bad

WIDE-A MERCHA In the MOTOR

EMPLOYER EMPLOYES' MODEL

Whole Establishment Likely to Shape Itself After "Boss's" Makeup—Thoroughness in Head of Business and What It Means.

Your customers are building up or tearing down your business all the time. Whichever it may be, depends largely upon you and how you have trained your force of assistants — salesmen and workmen — to do their work and look after the customers.

Men working in a garage get their inspiration from the men higher up. If the boss is easily satisfied and his only object is to get the customer out of the way and on the road without actually delving to the seat of the trouble and effectually curing it, the men will soon acquire the habit and handle all the trade that way.

On the other hand, if the boss insists that the work be done carefully and thoroughly the men will make a business of diagnosing troubles with a view to permanent results. No slipshod, half-baked work will come from such a shop; and pleased customers will do all the boosting that is necessary.

Respect Man Who Insists on Good Work.

This fact is being exemplified in a thousand different places every day. Men who use cars appreciate good work; men who repair cars respect a boss who insists on good work; they like working in such an atmosphere. They know that the mechanic who is a good workman need never fear as to his future. Customers will follow him from one place to another. When he is ready to go into business for himself he can cash in on this following.

Train your workers to take an interest in the cars you sell; explain what it means to you and to them to have the customer's interest continually at heart.

Just the other day a motorist went to a repair shop to get a fan belt put on. After the work was done and he was leaving, the workman's trained ear caught the noise of a loose propeller shaft. Instantly he stopped the customer and told him the trouble, and then proceeded to make the adjustment. The customer thanked him and paid the bill cheerfully on the spot.

By the way, the policy of getting cash for repairs continues to grow among garagemen; it is good business for everybody concerned. It eliminates the item of "bad debts" and permits fair, square pricing, and if there is any complaint to be made it can be settled on the spot.

CARRYING THE SERVICE IDEA INTO THE TIRE BUSINESS

The Tire & Auto Service Co., 2128 Woodward avenue, Detroit, have a tire service that makes a strong appeal to every car owner in the vicinity. The basic idea of the organization was and is to give a day-and-night tire service—to build and establish a tire business on the theory that if service is important on an automobile it is doubly important where tires are concerned.

Supposing you have a puncture and want a tire changed; no matter where you are, if it is within a radius of 25 miles from Detroit, they will send a man and a tire to you. Supposing you drive your car into the garage at night and, after breakfasting and getting all ready to leave, you discover that one of your tires has gone flat. You simply 'phone the Tire & Auto Service Co. and they will send a man who will make the changes during the morning or while you are on the way to the office. They charge 60 cents an hour for the man's time and have a regular tariff of prices for the various kinds of service. And they are open day and night and Sundays. The motorist who has had a blow-out on Sunday or late at night can thoroughly appreciate what it means to have help available. Does it sell tires? Well, the company is only about six months old and is doing a rattling good business; for obvious reasons the exact figures are withheld.

LONDON STORAGE RATES ARE MUCH LESS THAN NEW YORK'S

While storage of cars in garages outside the two or three largest cities in the United States may reach a price as low as $15 a month, garagemen generally are likely to marvel at the rates which are obtainable in London, which is somewhat larger than Greater New York but has lower garage rates by 50 per cent. and more in some cases. New York garage rates run from about $15 up to $45, according to the garage, location and size of car stored, but $15 is not common.

Also, in London the storage rate is weekly rather than monthly, and a fair sample of prices is obtainable from the price schedule of the Austin Motor Co., which has its London garage—a high-grade establishment—at 479-483 Oxford street west. The principal rates are: Private lock-up garage with electric light and water for washing, 15 shillings a week, or, in American money, $3.75 a week, or $15 a month; garage without lock-up accommodation, 12 shillings 6 pence, or $3.15 a week, or $12.60 a month; garage for one night, 2 shillings 6 pence, or 63 cents; washing and polishing a car, 4 shillings 6 pence, or $1.13. A customer who leaves his car for a short period, such as a couple of hours, is not charged anything.

Value of Idea is in Using It.

The only way a good idea can be made valuable to you is by putting it into practice. Just reading about the good ideas and the ingenious plans that have worked success for others will not help you in the least unless you put those ideas and plans into execution for yourself. One good idea put into action is worth a million that you have read about and forgotten.

PAVING WAY FOR NEW MODELS

Methods by Which Dealer Can Couple His Own With Manufacturer's Advertising—Whetting the Prospect's Interest Just Enough.

Many announcements of new models are being made or will be made in the very near future, which suggests that it is a time when the dealer can take more than ordinary advantage of the manufacturer's advertising.

An ideal campaign for a local representative or dealer at this time would be as follows: First stir up interest in the forthcoming new model and arouse curiosity by means of "blind" newspaper advertisements. By "blind" is meant statements that create interest without actually giving details, follow this up by a sign in the window stating that the new models will arrive and be on exhibition about such-and-such a date.

Paste the "Ad" in the Front Window.

Then when the manufacturer's announcement appears in Motor World or one of the other national publications, clip out the advertisement and carefully mount it on cardboard and display it in the window. By this time—or earlier—you ought to have the car. Write a note (personal) to every prospect in your territory inviting a visit of personal inspection or advising when you will have the new model at their town, if in another locality. Then 'phone your choicest list of prospects and make an appointment to send a car for them and bring them to your salesroom. People like to be noticed in this way—and the invitation to come and give his opinion on the new model is a compliment that will often get attention when nothing else will serve the purpose as well.

The day before the car arrives insert a striking advertisement headed "Will Be Here To-Morrow," then following a further statement of interesting facts; when the car is in your salesroom another announcement should be made to the public giving some of the most pertinent points without covering every detail.

Some dealers make the mistake of telling everything, leaving nothing for the customer to learn when he arrives. Just tell enough to make the matter interesting and crystallize curiosity into action so they will come and take a look.

SUMMER AND WINTER ENERGY AND THE ALL-YEAR KIND

Some salesmen put their energy in a refrigerator during the summer months, hoping it will keep fresh until fall—when they intend to use it. Others keep theirs out and expose it to the heat and find out how real it is; they learn that real energy starts up in the "think tank" and is impervious to weather conditions. It is just as available at 106 in the shade as at 60. It is this kind of energy that stirs up things and makes business when the other fellow is telling everybody how quiet it is. It means shutting the eyes to golf and baseball and boating and all the other things that take the place of work; in a word, it means sacrifice and ceaseless work during working hours—but the man who cultivates real energy or "hustle" will have plenty of time for outdoor sports when the other fellow is still looking for his weekly envelope.

SORTING PROSPECTS INTO THEIR PROPER CLASSES

Are you getting after your prospects? Have you got the live ones sorted out from the rest so that you can say without hesitating, "My best prospects are so-and-so"? If you have not succeeded in organizing your prospects in this way in your mind and on paper you had better get busy.

The good salesman has all his prospects graded into classes, and he knows just about when he is going to land this one or that one. Then he tries to beat his "hunch," and first thing you know he has done it.

The way to make a sale is to sell the man—and you will never sell him by staying away—just as you will never sell him if you simply call to "see" him. This is the time of vexatious delays and put-offs. It is also the time of sudden sales—deals coming to a quick head that you never dreamed would be closed till fall.

CHALMERS "CLEAN-UP" DAY AS A GOOD EXAMPLE

July 28th will be "clean-up" day for Chalmers dealers throughout the country. On that day, if not earlier, every Chalmers dealer will get out his mop and scrub pail and go through his establishment with a view to having it all thoroughly "laundered" and in spotless, apple-pie order for the reception of new Chalmers models.

Clean windows, clean floors, regilded signs, fresh kalsomine on the walls, and anything and everything that will make the dealers' place of business look like an enterprising, aggressive, up-to-date establishment ready for doing business with the best of the buying public, will be in order. Other dealers are recommended to try the same dose.

INSTRUCTION TO OWNERS AND ITS EFFECT ON GUARANTEES

A Dakota dealer who prides himself on his liberal guarantee, which amounts to "If you break anything in service the first year I will replace it free of charge," traces much of his success to the thoroughness with which he teaches buyers to drive and care for their cars. On 70 cars sold, his claims during the past year amounted to a little over $10. "Stay with him until he sends you home," is the brief, pointed order issued to the man who teaches them—and he does.

ACTION—THE STUFF THAT MAKES DREAMS COME TRUE

Thinking Without Execution a Profitless Occupation—Studebaker Salesmen Instructed to Shun Sales-losing Inactivity.

Gun experts know how far a gun will carry on a given charge of powder. To increase the range they increase the powder—up to the capacity of the gun.

It is about the same with salesmen. Most of us are capable of carrying much further than we do—we only need a little more powder. The powder that carries the salesman through the crowd, and makes him ring the bell with an order, is Action. He must first have the right frame of mind—the right desire—the right aim.

But this is not enough. Some of the greatest failures in the world have been those of thinkers and dreamers who had the right frame of mind—the right desire—and, generally speaking, the right aim, yet who just couldn't act.

Look at the names of the men in our own business who have become famous in their chosen work—they are great because they harnessed action to plan and drove with purpose.

Success is the direct result of desire intensified to the point of action. A clearly defined ideal, backed by a big charge of powder, must precede every permanent success, says the Studebaker News.

Wet powder won't do. This is the day of the man who really acts—whose powder has propulsion in it. There never has been a time since we of the present generation can remember when opportunity for intelligent initiative and action offered such quick and certain reward.

Selling of goods has undergone a change in the last few years, and the end is not yet. Yesterday's methods and reputations will not bring results to-day.

It is up to each of us to count the number of times that we have called on a prospect and found that he had bought some other make of car the afternoon before, when we felt deep down in our own minds that we had been guilty of inaction and could have secured the order if we had been on the job.

Doesn't it hurt?

When a prospect comes into the salesroom, he generally is interested in the purchase of an automobile. We doubtless use our best selling talk to intensify that interest and to create a desire to buy. The prospect seems nearly closed, but leaves the store without buying, and we sometimes do much loud talking about the order we are going to get in the morning. But somehow we are terribly busy the next morning and the call is postponed until afternoon. Maybe we get him then, but if we do it is luck.

Did you ever stop to think, Brother Salesman, that every time we postpone a "follow-up" we are allowing a perfectly good desire for our car to go roaming around the streets with that desire unsatisfied—a prey for the live salesman next door? Well, we are, and it's ten to one that the very salesman next door is the one that we have been roasting as a lucky dog that got his job on a bluff. No, he didn't—he got it because he was alive and had the ability to take advantage of our inaction and to intensify the desire of our prospect sufficiently to get the name on the dotted line.

There is a law that governs all this. Here it is: Every idea or conclusion which enters the mind of a prospective buyer is accepted as true unless hindered by some contradictory argument. The salesman with action is the one who never allows a prospect to run around loose without a pretty good antiseptic for contradictory arguments.

Think out a plan for every day's work—let nothing interfere with the calls that you know you should make—a little forethought and planning will save a whole lot of running around, and a little clear seeing will save a pile of looking.

One of our dealers in the East went out on the back porch one morning to bring in the milk bottles. He found them flirting with the morning paper. By the latter he noticed that Dr. Brown, the village doctor, in answering a midnight call had been thrown from his buggy in a mishap that resulted in the death of his horse. Without waiting for breakfast, the dealer jumped into his demonstrating car, drove to the doctor's office and offered the doctor the emergency service of car and driver, without cost. The car never came back, for the doctor, long proof against anti-buggy suggestions, realized the need, and salesmanship supplied it.

The successful salesman in this age of competition must have the ability to act—to see what should be done—then to "do it quick," caring nothing for precedent or tradition. Did Edison, Marconi, Burbank, Peary, or any other leader in the world's work, follow the path of dead men? No, they dreamed, desired, acted and won.

When your prospect list gets low and you can't possibly see a sale in sight, sit down and think. Work out something from your own brain. You'll be surprised at the mess of good ideas that you have stored away, if you will just take a little time to dig them out.

Every day in your own town something happens that leads to a possible purchaser. The live salesman is the man who has cultivated the habit of seeing opportunities—and the habit of acting.

The only habit that ever kept a man in a rut is the habit of not thinking—and not acting.

The greatest psychologists of the day have proved that the average man uses but a small fraction—say a third or a tenth—of his inherent brain power. The rest lies idle. Why? Because original thought has not put it to work—and the original way of thinking—your personal way of thinking—is the only way that will carry you to real success in your business.

Sell the thought to yourself—then translate it into action.

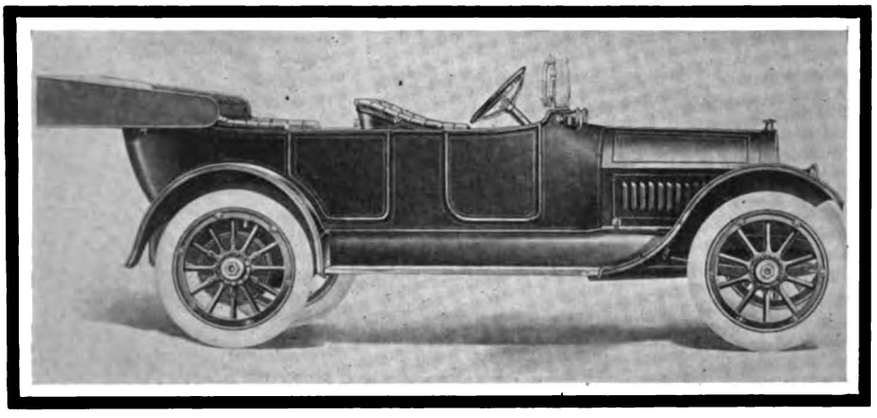
Change in Chalmers Price Chief Alteration.

With $175 lopped off its price, which henceforth is to be $1,775 instead of $1,950, the new Chalmers "Thirty-Six," specifications of which just have been permitted to become public property by the Chalmers Motor Co., of Detroit, Mich., is essentially the older Chalmers except that it has a number of detail refinements that affect more than anything else its external appearance. The fenders, for instance, now are rounded after the manner that appears to be gaining in popularity and the gasolene tank and spare tires now are carried at the back of the tonneau; control elements have been placed within easier reach of the driver and a dash carburetter adjustment has been added. Otherwise, changes are few and far between, the motor remaining of the long-stroke type with four 4¼ x 5½-inch cylinders; as heretofore, the gearset is selectively operated and provides four forward speeds and reverse, wheels are shod with 36 x 4-inch tires and the wheelbase remains 118 inches. As usual, the Gray & Davis electric lighting equipment is standard and the car is fitted with the Chalmers compressed air engine starter. Equipment that is included in the price is a top with Collins quick-acting curtains, rain-vision windshield, Warner speedometer, power tire pump, horn, pump, jack and full set o tools.

Cyclecar Project Interests Michigan Town.

Oscar J. Howick, of Detroit, who has designed a cyclecar, is coquetting with Fenton, Mich., for the factory necessary for its manufacture. He already has secured support and probably will locate there. The vehicle he has in mind will cost about $600.

Pierce-Arrow and Pathfinder Add Bumpers.



For the first time, a bumper has been made a part of the regular equipment of the Pierce-Arrow car; the Sager bumper is fitted. One of the new Pathfinder models also is equipped with a bumper.

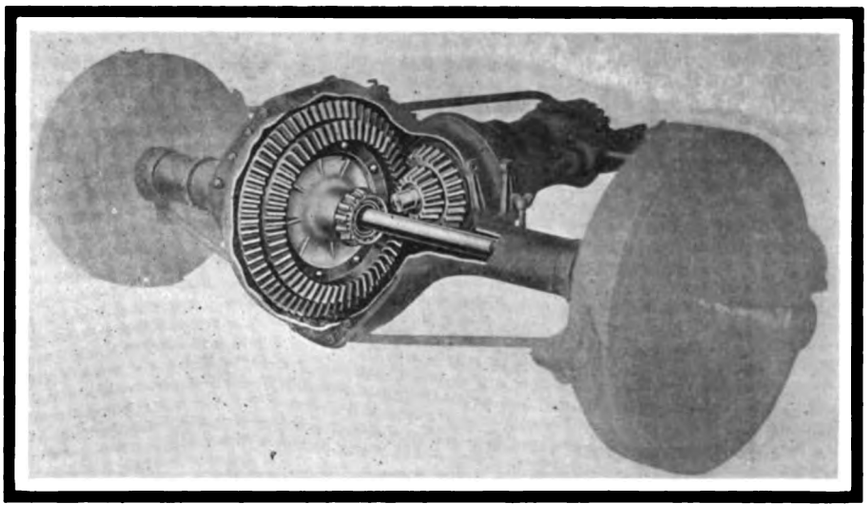
CADILLAC TWO-GEAR AXLE HAS ELECTRICAL CONTROL

Button Control of Drive Ratios Principal Feature of New Series Cars — Tilting Steering Wheel and Cushions, Too.

First reports regarding the adoption of radical construction "behind the dash" for the newer series cars produced by the Cadillac Motor Car Co., of Detroit, Mich., were correct, after all; it will be an electrically-shifted two-speed rear axle and not a transmission gear-shifter, as later and apparently trustworthy reports made appear. This almost revolutionary change, briefly, constitutes the chief element of newness in the new crop of cars that now are coming through the factory, for though there have been a number of other minor changes made, and equipment has been increased, none of the alterations are of a really significant character; prices remain the same.



STANDARD CADILLAC TOURING MODEL WHICH SELLS FOR $1,975

CADILLAC TILTING STEERING WHEEL

In adopting the two-speed rear axle, the Cadillac company has made what amounts to a serious attempt to reduce fuel consumption, and it is an attempt that bids fair to accomplish its ends. In place of the usual single bevel drive there are two bevel drives, one of them giving a final gear ratio of 3.66 to 1 and the other a ratio of 2.5 to 1. The lower gear ratio, it will be appreciated, is particularly suitable for city driving or for use on rough roads where the maximum of flexibility without the necessity for shifting transmission gears is desirable; and for driving at greater speed in the open country and where the roads are fairly good the higher gear can be called into use by the simple depression of a conveniently located button.

Just what saving in fuel consumption can result from the arrangement can be better appreciated from the statement that the high gear ratio permits a 42-per cent. increase in the speed of the car for a given number of engine revolutions to the minute. Thus, for instance, with the engine turning 700 revolutions to the minute, the speed of the car on the lower of the two gears will be approximately 21 miles an hour; with the higher gear ratio in use, on the other hand, the speed of the car, without any increase in engine speed, will be approximately 30 miles an hour. Consequently, in a given time, and without any alteration in engine speed whatsoever, the car will travel considerably further when running on the higher gear than it will on the lower one. This feature, which is a vital one what with the comparatively high cost of fuel, is in addition to a substantial lessening of wear in the parts due to their slower speed when the high gear is used, and also results in considerably lessened engine vibration at high car speeds. The arrangement of the bevels, which is beautifully simple, is shown quite clearly by the accompanying picture, which also makes plain that the axle is of Timken construction.

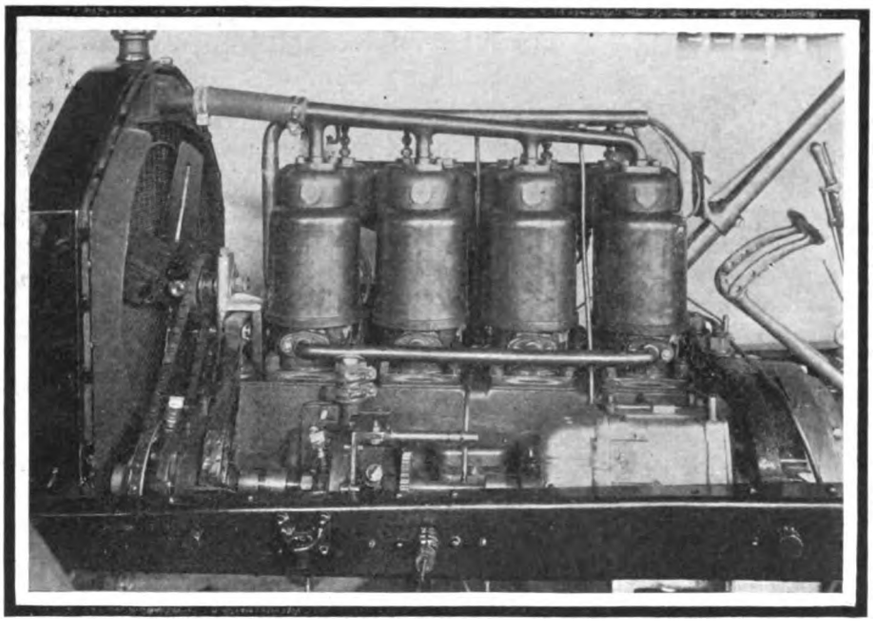
CADILLAC TWO-GEAR DRIVING AXLE WHICH IS ELECTRICALLY CONTROLLED

To start at the radiator of the newer Cadillac and "read" it back to the rear axle, reveals very little that is really new. The engine, for instance, is the same copper water-jacketed four-cylinder machine it always has been and the bore and stroke, which are 4½ and 5¾ inches, respectively, remain the same; the piston displacement therefore is 365.8 cubic inches and the A. L. A. M. rating, 32.4 horsepower, though needless to add, the rating is considerably exceeded and without any difficulty at all. Water is circulated through the copper jackets by means of a centrifugal pump and cooling is assisted by a light fan running on two-point ball bearings and having an adjustable belt drive. The radiator is of the tubular plate type. Oiling is by splash, constant level in the crankcase compartments being maintained by a positively actuated pump.

In the electrical apparatus of the car—both ignition and lighting and starting—several important alterations have been made with a view of increasing efficiency. The Delco system furnishes all the current that is used on the car, of course, and in the ignition portion of the apparatus an improvement has been made in the adoption of a dual system in which only one set of plugs, sparked either by current from the

Digitized by Google

storage batttery or from dry cells, is used. There is one high-tension distributor, and both automatic and manual control of the spark advance is provided for both systems. All the switches for ignition, lighting and starting are contained in a single switch housing, and one lock is provided which locks all the switches simultaneously. The lighting switch can be locked in any position desired.



In the lighting and starting equipment two noteworthy alterations have been made, not the least important of which is a material increase in the cranking speed of the electric motor. Probably the next most important change is the substitution of a single-wire circuit for the double-wire circuit that has been used in the past. By this means the wiring has been materially simplified, only half the amount of wire now being required that was needed under the old regime. Also, there now is an automatic temperature regulator on the voltage regulator, and this, with the cut-out relay, and the battery ignition relay, are contained in a box attached to the forward side of the dashboard under the hood.

The controlling switch on the generator has been eliminated and its functions now are performed by one of the brushes which is so interconnected with the clutch pedal than when the pedal is depressed to bring the cranking device into action the brush is brought into contact with the motor commutator and is removed from it when the clutch is released after the motor has started. When the brush is brought away from the commutator, auxiliary contacts are closed which bring the battery charging generator into operation automatically. Another electrical device that has been added is an electrically heated vaporizer in the carburetter to facilitate starting in cold weather. Incidentally, the poppet type air valve has been replaced by a swinging type valve and the special auxiliary air inlet has been eliminated as unnecessary.

Further along in the chassis, the clutch is of the usual cone type with large surface and heavy leather face. The whole assembly is readily removable. The gearset is of the sliding selective type and provides three speeds forward and reverse, which, in conjunction with the two-speed rear axle, permits no less than six forward gear ratios. Drive is through the orthodox shaft and two universal joints, the after one being telescopic. Brakes are internal and external, mounted on rear wheel drums measuring 17 x 2½ inches, and both sets are carefully equalized. The frame is a pressed steel channel section mounted in front on semi-elliptic springs and in the rear on the distinctive Cadillac three-quarter platform member; the rear side springs, however, have been lengthened six inches. Wheels measure 36 inches in diameter and are shod with 4½-inch tires on Q. D. demountable rims; the wheelbase of the standard car is 120 inches. The gasolene tank now is carried at the rear axle and fuel is fed under pressure by means of a pump attached to the crankcase and driven from the camshaft.

In appearance, the car is much like its predecessors, except that it is driven from the left side—all previous Cadillacs have had the steering wheel at the right side—with the control levers placed in the center of the footboard. The steering wheel itself, by the way, is different from anything else of its kind; it is hinged and may be turned down, parallel with the steering column, to permit easy entrance to the driver's seat; also to remove obstruction, the right side front seat upholstery is hinged and may be turned up out of the way of entering passengers.

Seven bodies in all are supplied on the single chassis; they are five and seven-passenger touring, roadster, four-passenger phaeton, three-passenger landaulet-coupe, five-passenger inside-drive limousine and seven-passenger standard limousine. The equipment includes top, windshield, lamps, gasolene gauge, speedometer, tire irons, tools, etc., to which has been added an electric horn and a power-driven tire inflator. Prices of the various models are as follows: Five-passenger touring, phaeton and roadster, $1,975; landaulet coupe, $2,500; seven-passenger touring, $2,075; inside-drive limousine, $2,800; and standard limousine, $3,250.

CADILLAC ENGINE SHOWING POWER PUMP AND DELCO SYSTEM

Correja Develops "Six"; Abandons "Fours."

Marking the entry of still another manufacturer into the popular-priced six-cylinder field, Vandewater & Co., of Elizabeth, N. J., who produce Correja cars, has let it be known through the Thomas Howard Co., of Brooklyn, N. Y., which markets the entire Correja output, that a "six" to sell with complete equipment for $1,800 has been developed for the coming season.

The new car will have cylinders measuring 3½ x 5 and cast in blocks of three with the valves located on opposite sides and enclosed. Power is transmitted through a cone clutch and three-speed selectively operated gearset mounted on the rear axle. A low-sided body with underhung three-quarter elliptic rear springs combine to give a rakish appearance that is accentuated by the rear location of the gasolene tank and spare tires; the wheelbase is 125 inches. Two sets of brakes are provided, both on rear wheel drums and both equalized, and an ingenious and simple adjusting ratchet is provided. The list price of the car, which will be the only one to bear the Correja name-plate, includes a silk mohair top and windshield and other usual equipment. The Jesco electric lighting and engine starting equipment is regularly supplied at an advance of $100 in the price.

Apple to Establish Chain of Branches.

In addition to those already established, the Apple Electric Co., of Dayton, Ohio, is making ready to increase its chain of Aplco service and installation stations until all of the principal cities shall have been included. The stations will carry complete stocks of Aplco lamps and lighting and engine starting systems and will be equipped in every way to install or repair those devices.

"BOOSTING" ONESELF AT THE BOSS'S EXPENSE

Reilly Dilates Upon the Unfairness of Advertising the Employe Through Publicity That Costs the Manufacturer Good Money—Publicity Men Who Hold the "Big Stick" Over Newspapers—or Try to.

Tom Meck, being now in charge of a Western sales district for the Sales Manager, was by habitat a Westerner and, therefore, as all Westerners do—the story-book kind, at least—whenever he went anywhere he "breezed." Wherefore, late in the afternoon he "breezed" into the town where

MECK SOUGHT AN ALCOVE AND A DEEP LEATHER CHAIR—AND WAITED

Reilly made his accumulation of shekels each year, "breezed" into the hotel and promptly at 6 o'clock "breezed" into the dining room.

But he wasn't "breezing" now. With a satisfying dinner under his monogrammed belt buckle, a soothing cigar alight and his straw sailor tilted just a trifle backward, he emerged from the dining room, and as he entered the lobby he may be said to have "tiddrummed." He had run down from the factory to visit his one-time employer, Reilly, and had arranged to meet the dealer in the evening at the hotel. Meck sought a quiet alcove and a deep leather chair—and waited.

In Reilly's tour of the lobby in search of Meck the dealer encountered Charley, the automobile man on the News, who was hunting out tourist stuff, and the two were still together when Reilly spied Meck. After those characteristic greetings which are supposed to follow a long period of separation, the trio went back into the alcove and talked—about nothing in particular, but just talked.

While Reilly and Meck were talking, something that was said seemed to stir something in one of the alcoves of the newspaper man's mind and, drawing a handful of papers from an inside pocket, he selected one and at an interval in the conversation of the two old friends asked, "Do you fellows know Loren K. Swedener?"

"Lorry the Swede," replied Meck.

"Sure!" exclaimed both Reilly and Meck in unison.

"Quite a man, isn't he?" suggested Charley, who continued to peruse the flimsy sheet he had unearthed in his pocket.

"Oh, more or less," responded Reilly.

"With the emphasis on the less," laughed Meck. "Why? What now?"

"I thought he must be quite a man from the amount of paper and postage that's devoted to him; he's been made a something-or-other in the Prince factory, and now he's appointing publicity men and various other things," explained the News man, who handed the flimsy sheet to Meck.

Meck read it, and smiled. He handed it to Reilly, who read it, and smiled also. Reilly handed it back to Charley, who put it in his pocket, but didn't smile.

"Well?" he ejaculated when no elucidation was forthcoming. "What's the joke? Quit grinning and open up! Is this man a joke, or what?"

"No," slowly responded Reilly, flicking the ashes from his cigar, "Lorry isn't a joke; he's——"

Specifications of "Lorry the Swede."

"A slap-stick comedian," supplied Meck.

"Just about that," agreed Reilly. "He certainly has gotten a lot of publicity in his day—much more than has been accorded to men who really are worth it. He's quite a card in his way."

Meck continued to chuckle to himself as if at remembrances, and Reilly continued: "There are a number of men in this and various other trades who are built from his specifications; they sound well, but that's a large part of all you can say about them."

"What's his pedigree?"

"Haven't you received it yet?" asked Reilly.

"I suppose I have," answered the newspaper man, "along with photographs and cuts and so forth, but life's too short to read all that bunk."

Had Great Desire for the Limelight.

"Well, I don't know where he started in business, but I'll guarantee he arranged to get his name in the paper the day after he was born. The first I knew of him was five years ago, when he was made assistant sales manager for the Burley Accessory Co.—and everyone else heard from him about the same time. After he was installed in a little office in their establishment he proceeded to form an alliance with the advertising manager and frequent interviews began to appear. They were all written by the advertising manager, but were accredited to Swedener, and a lot of them were printed, for the advertising man could turn out real clever stuff. He made Swedener say things that Swedener never thought he knew before.

"Then he made a jump and got a job as sales manager of a little automobile concern down East and straightaway he sent out a story to the effect that Loren K.

Digitized by Google

Swedener, formerly so-and-so, and so-and-so, had accepted a position as manager of this company. He apparently convinced the company they needed a publicity man, for shortly there appeared a story to the effect that Loren K. Swedener, manager of the whatever-its-name-was company, announced the appointment of whatever-his-name-was as publicity manager. It sounded just as if Lorry was the whole works down there.

"He apparently bulldozed everybody about the place, and the Swedener publicity kept going out in reams. It was Swedener this and Swedener that, and although he was drawing his living from the company, the company was a very minor item so far as newspaper mention was concerned. To read the papers it sounded as if Swedener was carrying the whole burden on his own shoulders and that without him the company would immediately slump off into nothingness. He——"

Not a Pause in Reilly's Dissertation.

"Come up to the room," interrupted Meck. "It's cooler up there."

"The three arose and entered the elevator, but Reilly never even stopped talking. He did stop an instant to remark. "It is cool up here. isn't it?" as they seated themselves in the breeze which drifted in from over the green trees and parks of the city's west side. Meck telephoned for three bottles of beer as Reilly went on: "Well, then Lorry had a couple of other jobs and, while I don't get my information from the men he worked for, I have it pretty straight that he isn't so much of a success as he would have people believe."

"It certainly looks bad when a man has five jobs in four years," commented Meck.

"Yes; it may be an honest upward step every time. but it does look bad. And now he's gone with this Vermont company and is still up to his old tricks. That story you have, you will notice, doesn't say he has appointed a publicity man, but says he announces the appointment, which means that the company probably hired the man, but that Lorry is making the thing an opportunity to get himself into the limelight. He has gotten himself in bad on numerous occasions by boosting himself and keeping the company in the background."

How the Publicity Man is Bulldozed.

"What makes the publicity man do it?" asked the News man.

"The poor little publicity man isn't to blame," replied Reilly. "He is out to make a showing for himself by getting as much stuff printed as he can, and Swedener tells him what a great man he is and persuades the press agent into believing he can pad his space average by using the name of Swedener. 'because it is so well known and he is liked by the newspapers.' "

"He's nearly as bad as the man who once asked me to use his name every time we said anything about the company he worked for," rejoined Charley.

"I should say that was very near the limit," said Meck.

"But you should worry," said Reilly. "The poor publicity man is the one who has his troubles. All you have to do is to print his stuff or throw it away, just as you please, so long as you get your column filled every day."

"Oh, sure! This is a fine young job I have," exclaimed the automobile writer. "Nothing to do but fill a column every day; no troubles, no worries, everything smooth sailing. Huh!"

"Huh what?"

"I'd like to have you do my work for

"HE HAS GOT IN BAD BY BOOSTING HIMSELF," REMARKED REILLY

about a week—you'd change your mind," said the News man. "I know all about this publicity man business; I had a little whack at it myself once. I know the poor press agent has his troubles, but that's no reason why we should give his boss a lot of free advertising. Giving a manufacturer a bunch of free publicity out of sympathy for his publicity man is like giving to one of these crippled beggars who are part of a syndicate and are working for some able-bodied man.

"It makes me sore, too, the way the publicity and advertising men try to club us into giving space to their dribble and drool. Their favorite stunt is to make their paid advertising contingent upon the amount of free publicity they get in a certain paper—at least, that's the gentle intimation they are always making. A newspaper in the eyes of an out-and-out publicity man is gauged by the number of lines or inches he can fill for nothing in the course of a year; the real advertising value of the paper is nothing at all to him; he is out to hold his job and make a showing, and if he can carry a little report in to his boss and say 'I got so many lines of publicity this year,' that's all he cares about, and if some of the publicity soft-soaps the boss in the right vein, he isn't unlikely to share the belief that the sheet is a great paper."

"But do they run their advertising in the papers that print their publicity?" asked Meck.

Fallacy of Running Publicity Stuff.

"There's where the rub comes; sometimes they do, but usually they don't. An advertising manager, if he is worthy of that title, knows what papers are good and what papers are not, and since he is out to get the biggest possible return from the money he spends for advertising he is going to buy space in the paper which is the best for his purposes, regardless of whether it uses his publicity man's stuff.

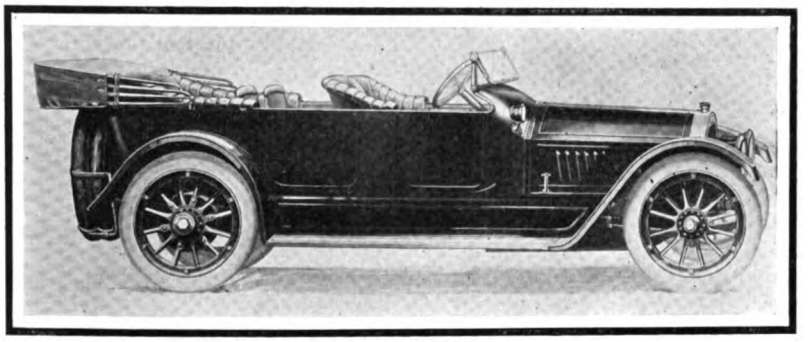
"How do you work your end under those conditions?" asked Reilly.

"There's only one way. That's to print only such stuff as is worth printing, regardless of who sends it out, and to plug for all the advertising we can get; we sell our advertising on our merits and do not ask it as a favor. We've got a paper that is a red-hot advertising medium, and when we can't sell on that basis we would rather not sell. Of course, during show week or on some special occasion, if a man is going to use an extraordinarily large amount of paid space we often, but against our will and best judgment, will run a little of that bunk stuff. You may be surprised to know, too, that the men who are spending money for advertising think more as a general rule of the paper which dodges these rotten handouts than they do of the paper that caters to them by running a lot of publicity that nobody reads.

The "Ad" Man's Gentle Insinuation.

"Now, take this Swedener handout; there's a small item of news in the fact that a new publicity man has been taken on, but just why we should drag Swedener into the thing is more than I can see. With the handout came a letter saying that they would appreciate our running the stuff and that when they make up their advertising appropriation they would be pleased to consider our publication. That's what they all say. Well, I've got to beat it, men; this'll never get me a column of tourist stuff."

"He's right, all right," said Reilly after the News man had gone.



"He's right enough," replied Meck, "but we all have our troubles. Even Andy Carnegie is having troubles trying to die poor."

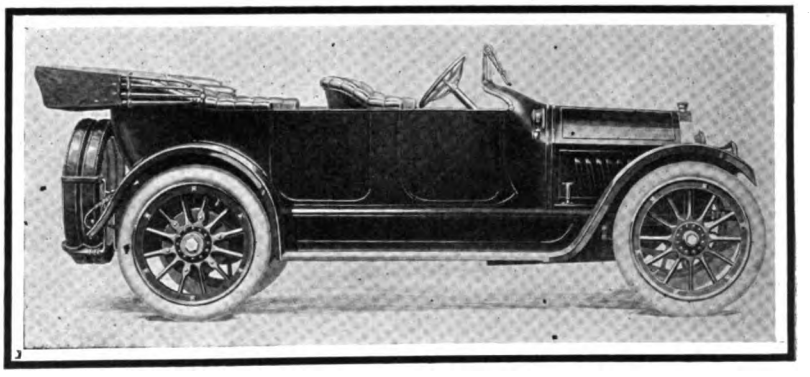
LEFT STEER AND MORE POWER IN COLE FOURS AND SIXES

Few Important Changes, but More than a Few Improvements—New Line Consists of one "Four" and One "Six."

Two or three changes that are of considerable moment and a host of betterments of less import combine to make the Cole cars of the latest series not a little more attractive, more convenient and, generally, more "worth while" than their predecessors, despite the fact that the prices are practically unchanged and that in general design and their larger aspects the machines are still wholly and unmistakably Coles. This is made evident by the details of the new models just presented by the manufacturers, the Cole Motor Car Co., of Indianapolis, Ind., and more than ever is "the standardized car" to be made the Cole slogan.

COLE SERIES NINE SEVEN-PASSENGER TOURING "SIX"



Two models comprise the series—that is to say, two chassis models, on which the usual variety of bodies is mounted. One chassis mounts a four-cylinder motor and the other a six, as in the past, the motors being the product of the Northway company. In both cases, however, the cylinder dimensions have been increased from 4⅛ x 3¾ to 4¼ x 5¼, the object and the result being obviously a substantial increase in power developed. And now the Cole car is a left-steered car, which it was not before, while the three-speed selective gearset is controlled by a centrally located lever. Three inches has been added to the wheelbases of both models, making the lengths 120 inches and 136 inches, respectively, for the "four" and the "six." On both jobs the tires are 4½-inch, but in the case of the smaller car they are 34 inches in diameter as against 36 inches in the "six."

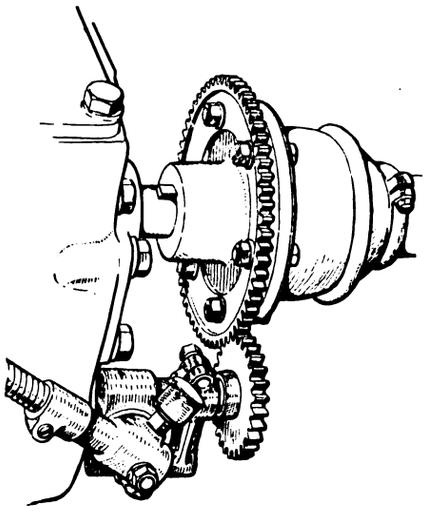
Pumping up a 4-inch tire is bad enough, but filling a 4½-inch tire is worse, which may account, partly at least, for the fact that the cars now are equipped with a Noil diaphragm air pump, gear-driven from the pump shaft and located at the front of the motor. The Warner speedometer drive has been removed from the usual location on a front wheel and placed just back of the gearcase, where the flexible shaft receives its drive from the tailshaft through spur gears—an arrangement that eliminates the trouble that is not uncommon when the drive is taken from the front wheel.

Among motor refinements the adoption of tungsten steel for the valves is indicative of the alertness of the manufacturers to the importance of "the best there is" for such parts, and a newly designed exhaust manifold of flattened form is given credit for a substantial decrease in the back pressure of the exhaust gases. Evidently believing that what usually is concealed under the hood ought to be attractive in appearance when the hood is raised, the motor builders have finished the engine "trimmings" in nickel, which matches the nickel finish of the bright metal parts of the whole car.

The comfort of the occupants of the car has been assiduously attended to in past models, and not a great deal has been left for improvement. However, by making the springs a trifle flatter and a little longer in the rear suspensions of both models an improvement in riding qualities has been effected, and while the fact that the upholstering is done in a particularly fine grade of long-grain leather may not make the seating any more comfortable, it has a soothing effect on the mind and also appeals to the eye, to say nothing of its wear-resisting qualities. And while nothing has been said anent the possibility of extending business among persons of unusually ample lateral dimensions, the fact remains that all doors have been made wider by four inches—which fact speaks for itself.

Tops now are of pantasote, with Collins curtains which roll up inside, and the windshield arrangement is something at which the Cole people "point with pride," for that useful accessory is solidly built into the bodywork and neither is nor has the appearance of being an "attachment." All braces and other excrescences are eliminated and, moreover, the windshield supports serve to brace the front end of the top when it is raised, dispensing with the long and more or less ungainly straps often employed. The top of the cowl has been extended backward sufficiently to form an effective protection for the instrument board, which, incidentally, is finished in a dull, ebony-like black that throws into fine relief the nickeled trimmings of the instruments. The "built-in" principle has been extended to the lamp brackets, fore and aft, and to the tire brackets at the back of the car, the general effect being one of completeness that is decidedly attractive. The big Janney-Steinmetz steel gasolene tank is more substantially hung than ever in the rear, the extended frame ends forming strong brackets to which the heavy steel straps are anchored. The fittings which serve as the tank anchorages also provide means for the attachment of the tire brackets.

NEW COLE SERIES NINE FOUR-CYLINDER TOURING CAR



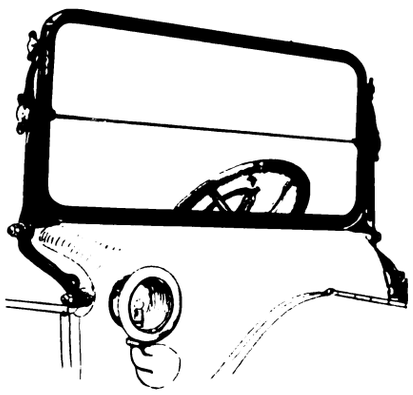
No little trouble has been taken in improving the body work, both as to appearance and as to its more utilitarian aspects, and there are slight changes in the lines, which are insufficient to alter the characteristic appearance of the car but still are

Digitized by Google

recognizable as improvements. The hood rests on aluminum sills. Underpans no longer are attached to the body, but are fastened direct to the frames.

The main features of the car, which remain unchanged, are of standard design in all cases, there being no attempt to build a car around any one idea. As already has been said, the motor is of Northway make, and it carries also the three-speed gearset with connecting clutch of the leather-faced cone type. The unit power plant is hung on a three-point suspension, two points in the rear and one in front. The circulating water is cooled by a Mayo cellular radiator. The propeller shaft is provided with Spicer universal joints and drives the rear wheels through a Timken axle; the front axle also is of Timken make. The steering gear is the Gemmer.

While the motors of the two models are alike not only in the matter of bore and stroke but also in general design, there are, of course, differences that are due to the



COLE SPEEDOMETER DRIVE

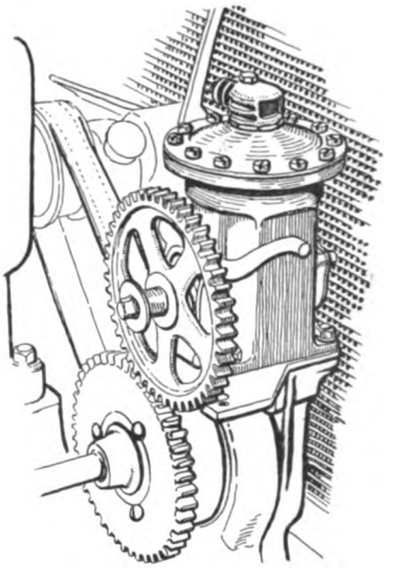
difference in the number of cylinders. The bigger motor has four crankshaft bearings, while the smaller has three. On the four-cylinder motor the camshaft is driven by helical gears, while, as before, Coventry "silent" chain drive is employed for the camshaft of the "six," the chain being made of such width that exceptionally long wear is anticipated for it. The camshafts have the same number of bearings as the crankshafts in their respective engines—three in the "four" and four in the "six." In both motors the lubrication system is of the pump-circulating variety, with constant level splash; the oil reservoirs have capacities of 9 quarts and 12 quarts for the smaller and the larger motors, respectively, sufficient for long runs.

The oil pumps are fitted with adjustments so that the flow of fuel can be regulated, and a sight-feed on the instrument board shows at all times the activity of the oil circulation.

Quiet gear changing is facilitated by the fitting of a leather-faced brake on the rear end of the clutch hub. A refinement in the gearset is the employment of a roller bearing where the primary gear shaft and the clutch shaft extension run together. In place of the squared sliding gearshaft formerly fitted, there now is a castellated shaft, which offers a better wearing surface and tends to prevent looseness after the car has been in use for some time. The fact that there is only 6⅝ inches of the secondary

BUILT-IN WINDSHIELD AND LAMPS

gearshaft between bearings insures the requisite stiffness in this member.



Double drop frames of similar design are employed for both models, with the obvious differences called for by the differences in the sizes and weights of the respective cars. Both are of the double-drop type, permitting reasonably low hanging of the bodies. In the case of the "four" the frame is 4 1/16 inches deep and of the "six" 5 inches.

In the matter of equipment, which is the same for both cars, no trouble seems to have been spared to leave nothing undone. The ignition, motor starting and illumination system is the Delco. The ignition timer is fitted with a governor which automatically varies the timing to suit the speed of the motor; the usual hand control is also fitted, however. In order to provide ample current for ignition purposes when the storage battery voltage is pulled down, as it may be by starting a half-frozen motor in frigid weather, a supplementary battery of dry cells is provided, a two-way switch permitting instant change of connection from one to the other. The storage battery is accessibly hung under the front footboards. In addition to the ignition and lighting switches, the instrument board carries the air pump for the fuel pressure, and the air gauge, the oil sight-feed, the Warner speedometer and eight-day clock, and on the right side there is a little door with a Yale lock which gives access to a convenient box for gloves and goggles—a convenience that may well be appreciated. The Delco electric horn is sounded by a button placed on the top of the steering column. A pedal is provided for operating the engine starting system.

All Cole cars take the standard finish, which is a very dark blue for body and wheels, with black and ivory hair-line striping for the frames, fenders, hubs and body mouldings; the windshield framing also is black, as well as the mudshield which projects beyond the radiator at the crankless front end of the car.

It is perhaps unnecessary to add that the cars carry the usual complete outfit—and perhaps a rather unusually complete outfit—of tools and so on; a drawer under the front seat provides a convenient place for the storage of the tool equipment.

Three body types are provided for each chassis. The "four" may be had as a roadster, a four-passenger or a five-passenger

NOIL PUMP AND DRIVE ON COLE

touring car, and the "six" as a roadster, a six-passenger tor a seven-passenger touring car. The "four" costs $1,925 and the "six" $2,600, with any open body. As a three-passenger coupe the "four" costs $2,350 and the "six" as a four-passenger coupe, $3,000, and as a seven-passenger limousine, $4,000.

Valve Pin that May Cause Trouble.

There is nothing much more mysterious or baffling than a tire which gradually loses its air, though it is positively known that the tube does not leak and that the valve is in good shape. But there always is a reason for such things, and one reason for loss of air may be that the pin in the tire valve is a shade too long, so that when the cap is screwed on it makes contact with the pin and pushes the valve off its seat. Filing a little off the end of the pin is all that is necessary to end the loss of air.

WESTERN GOAL IS NEARED BY "INDIANA MADE" TOURISTS

Dust-Stained "Boosters" Reach California After Alternate Baking and Freezing—Still Have Eight Hundred Miles to go.

Those "boost Indiana" tourists who left Indianapolis on the morning of July 1st are nearing their California goal; already they have covered some 2,700 miles—2,734.4, to be exact—and to-day (Thursday) they shake the dust of the State of Nevada, through which they travelled for three days, off of their hind wheels and for the first time set eyes on the soil of California. To-night they rest at Lake Tahoe, where they will be met by the Governor of the State, and henceforth their trail will lead over California roads and by-roads straight to the city of Los Angeles, where they are due to arrive some time on Saturday, August 2nd.

The experiences they have had so far en route would fill a book, and the speeches that have been made by Fisher and Bookwalter and W. S. Gilbreath, in the interests of the proposed Lincoln trans-continental highway would fill a much larger book; it is likely, too, that the nice things that have been said about Indiana products, and about Indiana-made automobiles, in particular, would fill another book; which is as it should be, for the tour has been made primarily to "boost" Indiana-made cars, and besides, many of the cars deserve all the nice things that could be said about them for the way they have negotiated the roads and so-called roads and near-roads their drivers have aimed them at. A glance at the accompanying pictures will make that fact plain.

As far as the cars that are making the trip is concerned, not one of them has met with serious difficulties as yet, though the Sierras that lie between them and their goal are viewed with trepidation by the drivers, who already have had ample experience in mountain climbing and the vicissitudes that go with it—the latter meaning rough passes, scarcely wide enough, precipitous ascents and descents, and a succession of bumps and jolts calculated to wear down any but brave spirits. On one of these mountain roads, the Brown truck that is carrying luggage and tires is said to have stripped one of its gears because of the tremendous load it is carrying; but it is continuing nevertheless and at last accounts was only a day behind the caravan and fast making up the time lost for repairs. Which, briefly, is the only mechanical trouble that has assailed the tourists.

But if they have had no mechanical troubles they have had troubles enough of other kinds to make up for the discrepancy—or, rather, that fortunate circumstance. They have been alternately baked on the plains, stifled with dust and sand, marooned in the mud and frozen in the mountains. Leaving Salt Lake City, every one of the cars was festooned with five-gallon canvas desert water bottles against the long dry seige between that interesting city and Kearney's Ranch, which was the last telegraph and telephone station they encountered before they reached Ely, Nev., on Monday night, 21st inst. Kearney's Ranch is a tiny little cattle station far in on the desert and 25 miles south of the Nevada State line.

Dust probably has caused the tourists more inconvenience than has anything else and it has not always been as easy to get a bath now that real civilization has been left behind.

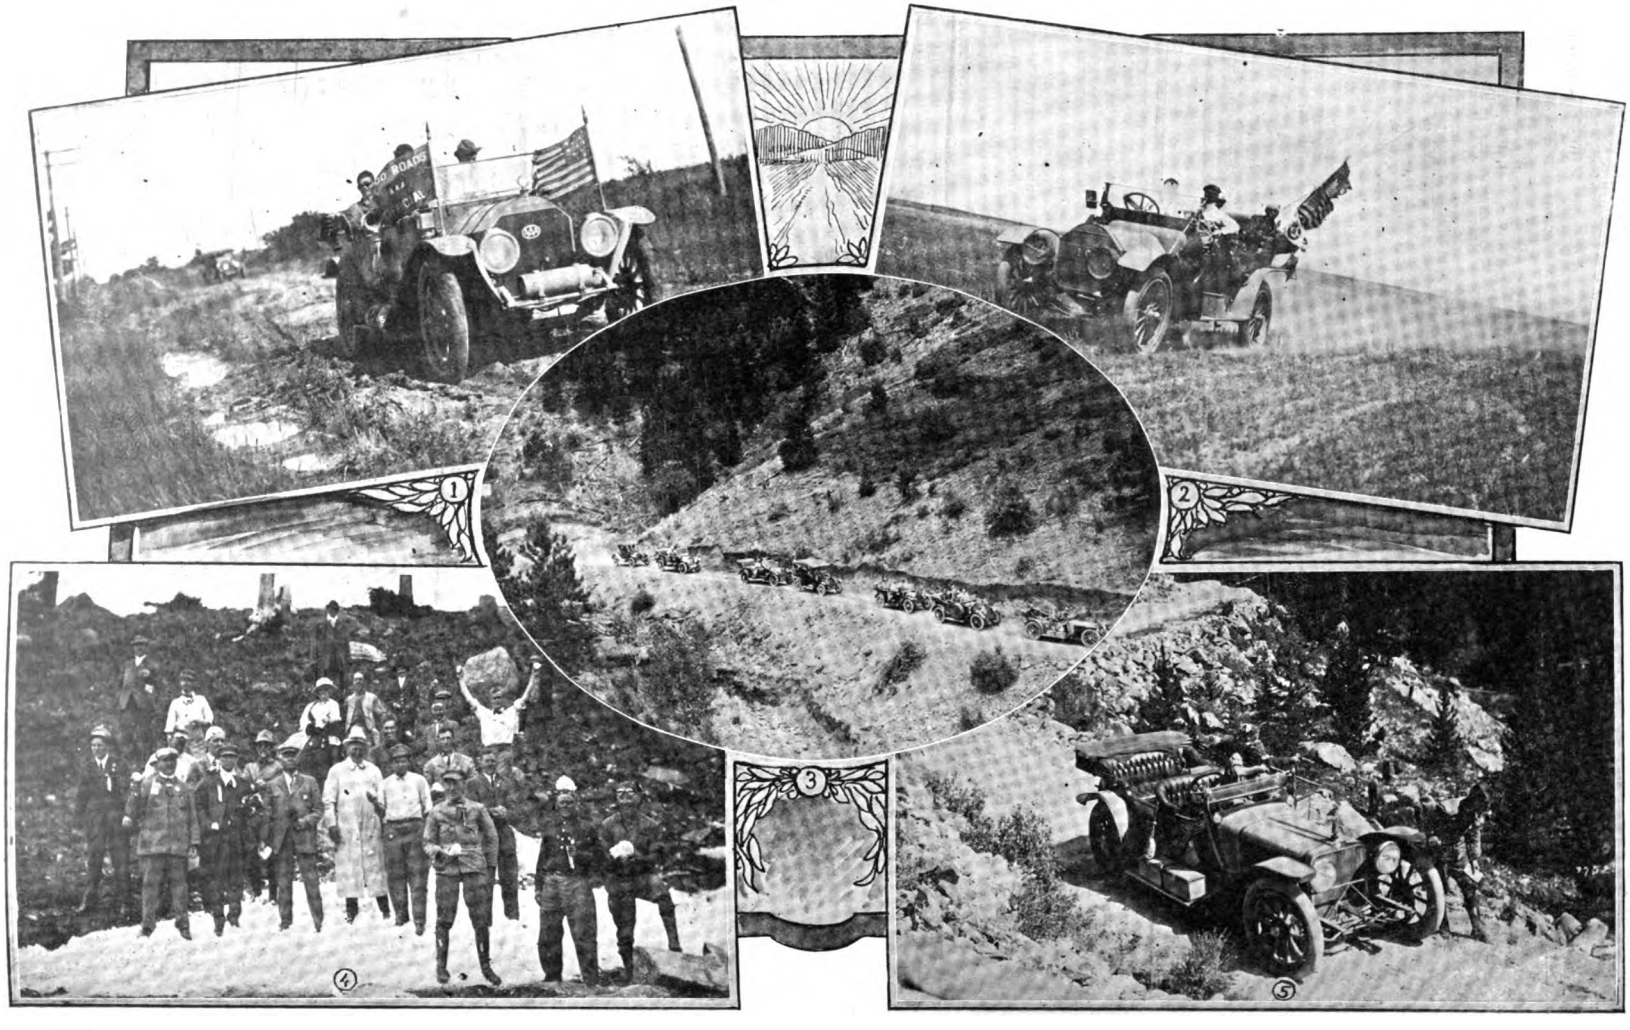
In the long mountain climbs that have been made, radiators have steamed merrily, and when the tourists have reached the top of five-mile grades averaging from 15 to 22 per cent. they have not been as hot as their motors. Up there in the mountains the snows remain the year around, the atmosphere is decidedly chilly and coats and wraps discarded on the burning sands hundreds of feet lower down were more than ordinarily welcome. Snowball battles became comparatively common, and when the drinking water ran low it was a simple matter to melt snow on hot radiators. Just what the tourists have encountered on the trip is told better by the pictures than ever it could be told in words.

As the drivers reach out in the desert, the price of gasolene goes steadily upward to 50 cents a gallon and then to 60, and it went even higher in some parts of Utah. But this is not troubling the drivers of the two Henderson cars that are making the run on kerosene; so far one of them has used 94 gallons of coal oil purchased at country grocery stores at from 14 to 25 cents a gallon in the mountains; near the larger cities the price has been 11 cents. For 1,875 miles the total fuel bill was but $11.75, including 90 cents worth of lubricating oil. The Pathfinder car that was started from Indianapolis with a sealed bonnet ran just 1,500.4 miles before a short-circuited magneto made necessary the breaking of the seals, the car then being in the heart of the Rockies.

Although the last leg of the run now has been entered upon and for the next ten days the tourists will roll over California heath, it is not expected by any means that sand-papered boulevards and level stretches reach all the way to Los Angeles. The 805-mile run to the coast may not be as tough as the trail that has been covered, but those who make up the party are not discounting tales of poor roads to come.

Milwaukeeans Offer Race Settlement.

After a delay of nearly a year, it appears that creditors of the Milwaukee Automobile Dealers' Association, which went "in the hole" some $38,500 in promoting the Vanderbilt and Grand Prix races last October, will get about 16 or 18 cents on the dollar, but they will not get it from the association itself, which, it is admitted, has absolutely no funds. The settlement is in the hands of T. H. Spence, of the law firm of Quarles, Spence & Quarles, who, in a letter sent out to all creditors, made it very plain that the moneys to be distributed by him represent voluntary contributions from "some of the members of the association, who, out of a sense of partial moral responsibility for the unfortunate situation, have personally and independently of the association raised a fund for the purpose of distribution among the creditors."



The amount of the contribution made by 15 of the dealers is approximately $7,500. Just what the settlement means to those to whom the association owes money is revealed by Ralph De Palma's case; not only does he lose the first prize for winning the Vanderbilt race—about $3,000—but his hospital and surgeon's bills, as a result of his accident, cost him about $1,000, to say nothing of two months' time. For this he will get about $600 if he is willing to accept it; and if he is not, he will get nothing. Among the other creditors, Starter Wagner has a claim for $1,700, including $900 for expenses, and the association owes Ed. F. Korbell, for press agent services, $250.

Chicago Motor Club Plans Cyclecar Test.

Unless plans miscarry, that part of the United States which skirts Lake Michigan will be the scene of the first reliability tour for cyclecars that has ever been run—if a sufficient number of them can be rounded up. The Chicago Motor Club is the sponsor for the event and the cyclecars will be classed by themselves as a section of that organization's annual "Around Lake Michigan" reliability tour, which is scheduled to start from the Windy City Sept. 8th. As the C. M. C. definition of a cyclecar is the same as the Royal Automobile Club's, it means that only vehicles having engines with less than 1,100 cubic inches piston displacement and weighing less than 784 pounds will be eligible, which leaves a very small field of American cars from which to draw. If the entry list fills, the little cars will be required to travel the same route as the "sure enough" automobiles, but at only 75 per cent. of the speed made by them. The winner will get a cup.

PATHFINDER STICKS TO TRAIL ALREADY BLAZED

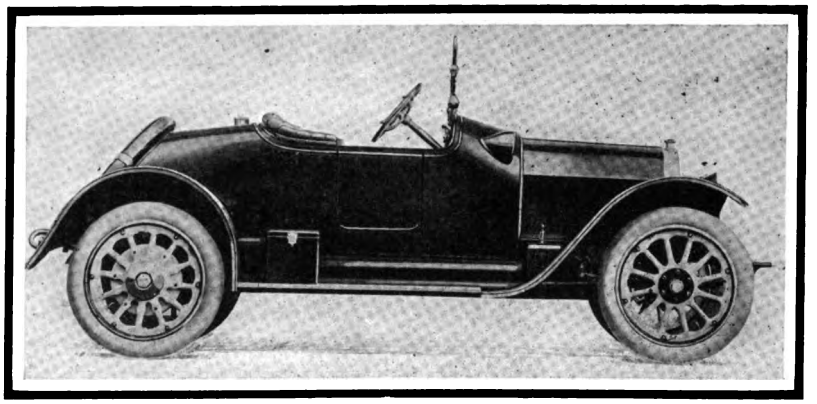
Minor Refinements Only Found Possible—Better Appearance and Better Riding Chief Results—Full Equipment Adopted.

Judging from the specifications that just have been made public covering the latest models of the Pathfinder car, that machine, true to its name, has found a path, and shows little tendency to deviate from it. Which is as much as to say that as the Pathfinder car was, so it is; no opportunity has been found to make mechanical changes in any of its parts, and the manufacturers, the Motor Car Mfg. Co., of Indianapolis, Ind., have done as most other manufacturers are doing—made a good thing better by dint of such small betterments as appear to be required.

SIDE VIEW OF STANDARD MODEL PATHFINDER TOURING CAR

Perhaps the most notable change that has been brought about in the Pathfinder is that henceforth all cars will be sold fully equipped, the regular prices including the full list of those things which the owner must buy sooner or later anyway, and might just as well purchase with the car as afterward. Chief among the things that now form part of the outfit of the car is the Gray & Davis electric lighting and engine starting system, which is installed in the same way as in previous models. In addition to this, and to the usual list of accessories ranging all the way from a top to a tire iron, the newer cars are fitted with bumpers and are equipped with electric horns.

Formerly the various instruments which necessarily are placed under the eye of the driver were placed on the dashboard, under the cowl. Now they have been brought bask to the rear of the cowl, being ranged on a polished instrument board where they are more conveniently seen and more easily reached. On the touring car the tires, which formerly were 36 x 4 inches, are 35 x 4½ inches; the former dimensions are adhered to in the Cruiser, which, however, will be fitted with wire wheels in lieu of wood wheels, if the purchaser so desires, at the same price. Add a slight change in the sweeping curves of the mudguards of the various models and the list of things that are but were not is complete.



Yet there is one more thing—which, however, will have no effect on the way the car runs. The Pathfinder arrow has been discontinued as a trademark, as already has been stated in Motor World, and its place has been taken by what the makers call "three generations of pathfinders"—pioneer scout, prairie schooner and motor car. The Pathfinder motor, which is a Continental and is rated at 40 horsepower, is of the L-head type with cylinders cast en bloc and a three-bearing crankshaft. The regular dynamometer test registers 42 horsepower at 1,300 revolutions per minute. Lubrication is effected by a constant level pump system, with splash for the cylinders. Helically cut timing gears ensure quiet running, so far as this particular part of the machine is concerned, and, it may be said, the motor as a whole is exceptionally quiet in operation.

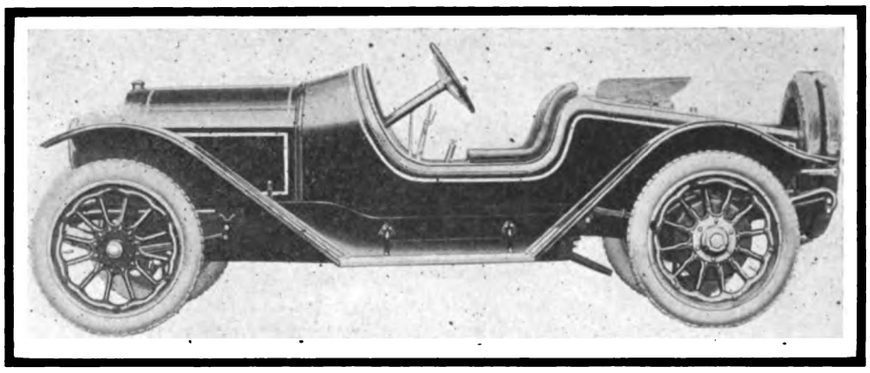
The power plant is of the unit type, the gearcase being bolted to the flywheel housing. The gears provide three speeds, selectively controlled by a lever on the right side, the steering wheel, of course, being on the right side also. The clutch is a leather-faced cone. Annular ball bearings are employed throughout the clutch and gearset.

The propeller shaft runs in a heavy torque tube which terimnates, at its forward end, in a fork or yoke which is trunnioned on a cross frame in line with the universal joint at the rear of the gearcase. This form of connection for the torque tube is one which has many adherents, and is quite worthy of them. No radius rods or other retaining or bracing members are required. The rear axle is of the floating type and has a large inspection plate at the rear of the gear housing. The driving pinion is provided with an adjustment which can be manipulated from the outside, compensation for wear thus being made very readily.

The frame, which is heavy and of the double drop pattern, having a "kick-up" at each end, is carried on four semi-elliptic springs, those in front being 38 inches long and the rear springs 50 inches long. The spring shackle bolts are ground to fit accurately in their eyes and are fitted with grease-cups.

A good big steering wheel is provided—it is 18 inches in diameter, with a corrugated rim to afford a good grip, regardless of possible slipperiness—and the steering gear is, of course, irreversible, of the worm and gear type. The gear is of the "full" type—that is, it is a complete wheel, and not a mere segment, so that it can be turned when worn and a fresh, unworn part brought into mesh with the worm.

PATHFINDER ARMORED ROADSTER SHOWING TIRE CARRIER



Protection from dust and dirt is assured to the occupants of the car by the employment of sheet metal filling pieces between the running boards and fenders and the

Digitized by Google

body of the car. All the working parts are housed, of course, and the car has been made about as thoroughly independent of road and weather conditions as its designers know how—and that is saying not a little.

All bodies are of sheet steel, built on very heavy sills and made with felt-packed joints. The upholstering is done in hand-buffed leather and the padding is of curled hair—genuine hair, and not near-hair, or moss. The cushions are of ample depth, being 10 inches thick, and they are tilted at the angle that has been found most restful to the body. The wheelbase is 120 inches and, on all regular models, the tread is the usual standard, 56 inches. On special order it will be increased to 60 inches, which frequently is required for Southern roads.

All models are mounted on the same chassis and, as heretofore, there are six models — touring car, phaeton, armored roadster, Martha Washington coach, cruiser and delivery wagon, the latter having a capacity of 1,500 pounds.

BOAT-LIKE APPEARANCE OF PATHFINDER CRUISER ROADSTER

English Authority on Future Motors.

Dr. Dugald Clerk, the British authority on matters pertaining to internal combustion engines, has expressed the hope that the future will see the development of new cycles of operation which will result in much higher thermal efficiencies than are possible with present types of gas engines. Dr. Clerk also has hopes of the gas turbine, though he states that so far there is nothing of that kind in existence that can compare with the steam turbine or the reciprocating gas engine for efficiency.

Candle as Emergency Equipment.

While emergency electric lamps are good things, and oil lamps have their uses, on occasion, even on modern cars, there are a few drivers who keep, tucked away in a tight box in a corner of the tool-box, a candle and a supply of matches as a last resort. Such things rarely are needed, but when the necessity for them arises it is likely to be a real, man's size necessity.

HOW ENTHUSIASM WILL WIN WHERE INDIFFERENCE FAILS

"Saying a Thing as if You Mean it" and What it Means in Selling—Sincerity Advised in Big Corporation's Sales Sermon.

Saying a thing as if you meant it and saying it as you said it because you had it to say and wanted to get it out of your system and didn't care much how people took it, are widely variant methods that are pursued in salesmanship; being enthusiastic and being indifferent are the dictionary terms which best apply to these two attitudes, and every salesman should know, if he doesn't know, that the man who is enthusiastic about his work is many times better equipped than is the indifferent man in the struggle for success.

And further, being enthusiastic and trying to act as if enthusiastic are not the same, all of which is the text of a little sermon to its sales organization by the National Cash Register Co., of Dayton, Ohio, in the N. C. R. Weekly.

"Study enthusiasm—its causes and effects," it says. "A man may have all the qualities that go to make up success—but unless he has the ability to enthuse, he may not often command the sympathetic audience that he seeks. Enthusiasm is a big word. It means much in modern business. It is the password that opens the door of prosperity.

"No man can be enthusiastic unless he uses his brain, takes care of his body and looks ahead. No man can be enthusiastic unless he is a true believer in his increasing efficiency. You never saw an enthusiastic man who stood still. Enthusiasm pushes you forward. Indifference drags you down. Enthusiasm springs from optimism. Indifference comes from ignorance.

Some men try to act as though they were enthusiastic. The masquerade fools no one. People see through the bluff and disguise. Contrary to some people's belief, enthusism does not mean lots of noise and bluster. Enthusiasm is an expression of sincerity. Some of the quietest men are often the most enthusiastic. The only man who can really enthuse is the man who thinks, regardless of the noise he makes.

"Be enthusiastic. Stay enthused. Fight indifference. Join the men who do things. Leave the men behind who make-believe. Open your eyes, and you'll see other successful men hurrying along the road of success.

"Enthusiastic men want you to join them and belong to their crowd. If you're unenthusiastic and indifferent, they'll turn a cold shoulder to you. No man with red blood in his veins wants to associate with a half-asleep man.

"You can't yawn in the face of progress—and advance. Progress wants to meet the man alive."

Detroit to Require Fenders on Trucks.

By September 7 every motor truck in Detroit, of one-ton capacity or more, must be equipped with a fender, which, while the ordinary street car type is not specified, must be capable of doing the same kind of work; in other words, the fender must be capable of preventing a person from rolling in under the truck or being rolled upon by the truck should the person be knocked down or fall in front of the vehicle.

The Common Council debated the matter and, holding that accidents of the sort described were becoming entirely too numerous, passed an ordinance requiring the life-saving fender; it is aimed especially to protect children. No particular type was described, this being left to the men who build or operate the trucks. Since the ordinary automobile fender is not designed to perform this sort of work, the Detroit truck men are seeking some way out of the dilemma.

One Frank Larrabee, of Chicago, has already appeared on the scene with a patented safety fender, and it is said to give promise of being satisfactory; the authorities approved it and the truck makers are likely to be obliged to manufacture it under a royalty. The Larrabee fender is said to have been approved also by the Chicago Vehicle Commissioners.

Where Portable Vise May Prove Useful.

An extremely handy thing to have along in the tool-box of the car is a little vise which can be screwed to the running board. The amount of trouble this inexpensive affair can save is astonishing. Special vises are made for car use, with detachable swivel bases that are fixtures on the running board, but for all ordinary purposes the common variety of vise is good enough.

COUNTING THE COST OF LIGHTING BY ELECTRICITY

Fuel Measurement in Tests Shows Difference With Dynamo Driving —Acetylene Man Talks on Electrical Shortcomings.

It is fair to say that not one automobile owner in fifty fancies that electric lights or electric starters in any way affects the power of his engine, much less the quantity of gasolene that is consumed. As a rule, owners know little and care less of the scientific or engineering side of the question.

But the truth of the matter is that no one ever gets anything for nothing. Everything has to be paid for in one way or another, and the man who uses an electric lighting and engine starting system pays for its operation when he buys gasolene—for it requires gasolene to generate power, and not even the slightest increase of power can be obtained without a corresponding increase in fuel consumption. As to the exact amount of increase, it is a pretty question. A generator turning over without load may take so little power that the increase actually cannot be accurately detected, while the connecting of the wires through the resistance of the lights or of the storage battery may, and probably will, add a load that is easy to determine, at least with a reasonable degree of accuracy. Just to give a rough idea of what may happen, a dynamo that is charging a battery at the rate of, say, 35 amperes and 7 volts will be generating current at the rate of 245 watts, which is the electrical equivalent of, roughly, a third of a horsepower. But as the efficiency of the generator is not 100 per cent.—that is to say, it does not convert into electricity all of the power that is transmitted to it by the driving motor—more than a third of a horsepower must be used to drive. Assuming the efficiency of the generator to be 50 per cent.—and makers claim efficiencies all the way up to 85 per cent.—it is clear that two-thirds of a horsepower will be needed to drive the generator and get the current specified. The power required to generate any given volume of current is fixed and unalterable, apart from the factor of generator efficiency, and may readily be found by multiplying the amperes by the volts, which gives watts, and dividing the watts by 746, which is the number of watts required to equal a horsepower. To this, of course, must be added the increase demanded by the efficiency of the generator.

But, after all, the real measure of the cost of running an electric lighting and engine starting system is the difference between the cost of running a car with and without such a system. And it was with a view to ascertaining what this difference is that R. H. Combs, a representative of the Prest-O-Lite Co., of Indianapolis, Ind., which naturally regards makers of electric sysetms in the light of business rivals, conducted a series of tests on the famous Speedway. The results are given in the accompanying table, which indicates that the maximum increase of gasolene consumption due to the use of the electrical equipment was 12¼ per cent. and the minimum 6.9 per cent. Combs made voluminous comment on the tests, of which the following are the more vital excerpts:

"The result of these tests shows that from 5 per cent. to 12 per cent. of the fuel fed into the engine of an electrically lighted car is consumed by the electrical apparatus. Evidently the 'waste power' theory is in urgent need of revision.

"The method of testing involved disconnecting the main line and attaching to the carburetter a special line and testing can, the bottom of which was so constructed as to drain perfectly. The car under test was first run as far as possible on a gallon of gasolene with the engine connected to the electric generator and the battery being charged, and then with the generator disconnected, another measured gallon was consumed. Identical conditions of passenger load, carburetter adjustment, speed of car, and position of spark were observed and the mileage in each instance as recorded on the odometer was checked against the known mileage of the Speedway. . . .

"Another thing for the motorist to consider is the fact that electric lighting dynamos on motor cars are rated at 25 per cent. efficiency. This means that on this small-sized dynamo, 75 per cent. of the power put into it is wasted. And on top of this the major portion of the dynamo's output is lost before it gets to the lamps, and also through the inefficiency of the storage battery. . . .

"Tests Nos. 1, 2 and 4 in the tabulated report were driven with the headlight and tail-light burning when the electric generator was operating. Test No. 3 was driven with all lights extinguished.

"Test No. 3, involving the flywheel type of generator, was made by disconnecting the wires leading from the generator. In this construction, of course, it was impossible to remove the generator from the flywheel, thereby giving the engine complete relief from the magnetic load on the second part of the test. Something should therefore be added to the percentage shown on this car.

"The car in Test No. 4 has no magneto, and since the storage battery was not deemed sufficiently charged, both sections of this test were driven on dry cell ignition. This report takes no account of any possible weakening of this ignition on the second part of the test with the generator disconnected, the condition of the dry cells being unknown.

"But even ignoring these factors, this report shows an average of over 10.7 per cent. fuel consumption by the electric dynamo on the moderate-powered, moderate-priced cars tested, which cars, by the way, constitute the vast majority of all American cars made and sold.

"And yet these percentages are not large enough to show the exact difference in power and fuel consumption between a car equipped with gas lighting and the same car equipped with electric lighting, because in these tests we were not permitted to relieve the car of the large difference in weight between its electric system and a gas lighting system. The percentages shown were obtained merely by disconnecting the generator so that the engine would not have to operate it. . . .

"It is the standard contention of electric starter manufacturers that the same dynamo and battery which would be needed for lights alone will operate the starter. This we believe is true, and the only allowance for difference in cost in operation should be for the added weight of the starting mechanism itself and for the added wear and tear on the battery.

"These items, however, have little or no connection with the generation of electricity by dynamo. The size of the battery is largely determined by the number of hours of light which it must provide and this, in turn, determines the size of dynamo which is to charge the battery.

"For instance, the discharge rate for two average headlights and one tail-light is between 9 and 11 amperes. Therefore the dynamo must generate close to 14 amperes

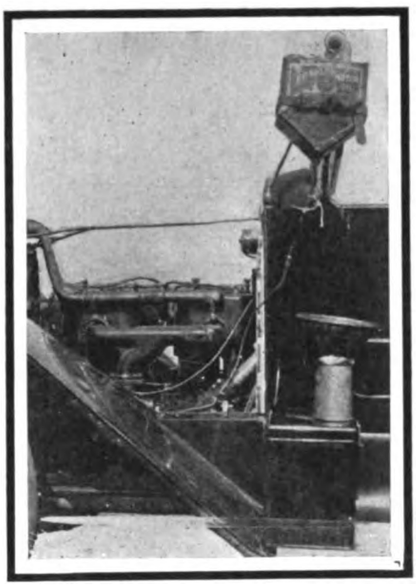
Digitized by Google

if the battery is to be charged at all for the owner who does most of his driving by night and little by day.

"It is hard to draw the line exactly in this matter. We have heard of cases where the car owner who had electric lights and no electric starter, had to run his engine for an hour before he could go out for his evening drive, in order to charge the battery sufficiently. On the other hand, some of the cars on the Indiana Pacific tour have had to burn their lights a few hours each day, in the day time, to keep from overcharging the battery, in spite of the current consumed by the electric starter. . . .



"Our information, gathered from dealers, is that storage batteries used for both starting and lighting are having an average life of less than one year. Batteries used for lighting alone are having an average life of considerably less than two years. We doubt very much if many owners will get two years' life out of the battery, particularly in view of the abuse and neglect which it receives, so that our allowance of two years' battery life in the estimate of electric lighting expense is excessive, if anything. I know of no battery used for automobile lighting which its maker guarantees for more than one year. . . .

"In buying an electrically equipped car, one of the first things the average customer is told is: "Put a little water in the battery now and then. That's all you have to do, and the rest of the system is better off if you leave it alone.

"Somewhere in the side pockets or tool box of nearly every electrically equipped car, there are instruction books issued by the storage battery makers and by the maker of the lighting and starting system. Do these instruction books say, 'Put a little water in the battery and then leave the thing alone'? They distinctly do not. Instruction books would be unnecessary if the care of a storage battery and the care of an electric system in general were as simple as the average customer is led to believe is the case. . . .

"It is a notorious fact that cars in general are getting heavier. True, electrical equipment is not wholly responsible for this, but it is the largest single element in this tendency. It must be remembered that when a motor car maker adds 200 pounds of electrical equipment, he must strengthen the construction proportionately throughout, perhaps putting an extra cross member in the frame, using heavier frames, heavier springs and larger tires, and using a larger engine, not only because of the power consumption of the electrical apparatus, but because of added weight all through the cars. Thus it is that cars which formerly listed at 2,800 pounds are now weighing 4,100 to 4,300 pounds.

"Undoubtedly the purchaser of automobiles is responsible for this condition, but not wholly so. On this point the craze for electric lights is typical. The demand for electric lights on automobiles always existed. And when the dynamo-battery systems made their advent, the public was assured that 'At last we've got it.' The public was overpowered by the alluring prospect of having electric current generated by the engine 'for nothing,' and with practically no trouble, and so the craze for electric lighting spread like wildfire. It can be shown to-day that the public demand was an absolutely unthinking one, based upon almost total ignorance of what the application of this equipment to an automobile really meant. . . .

HOW PREST-O-LITE FUEL TEST WAS CONDUCTED

"The self-starter demand is certain to continue. But the self-starter that will eventually come to stay will not be heavy and will not be complicated, and, above all, it will not be a kind of apparatus that an amateur can easily ruin, either through ignorance or wilful abuse. I know of many automobile factories to-day using electric starters, which are constantly working upon an air starter in the firm belief that one year from to-day compressed air will have displaced electricity in the popular starter demand. . . ."

"Fiscal Agent" Denies Machinery Purchase.

It isn't often that a "fiscal agent" conducting a stock selling campaign does that sort of thing. For that reason, T. S. Sprague, who is serving the Detroit Pneumatic Tire Co. in that capacity, has permitted himself to stand out by printing in conspicuous fashion in Detroit papers an advertisement denying that the Detroit Pneumatic Tire Co. has "already purchased machinery for its factory." He declares that "the statement is not true," adding that it was inserted in one of his Detroit advertisements without his knowledge. He wants it known "that the company has not bought any machinery yet"; and "that it does not have to make any misstatements, because it has a tire and stock which sell on their own merits."

Sprague, as stated in last week's Motor World, is conducting a spread-eagle stock selling campaign in the interests of the Wilson tire, which he heralds as the "final solution of all tire troubles." He is responsible for the statement that Detroiters brought their money to him in such numbers, or in such bunches, that it was necessary to turn late comers away because the days were too short to permit of taking their cash.

Velie Dealers Confer in Tented City.

Conferences of dealers brought about by individual manufacturers, which have become very much the fashion in the trade within the past few years, have taken many forms and been held in many places, but never under more novel conditions than the dealers' conference of the Velie Motor Vehicle Co., which now is in progress. The Velie dealers and sales staff, together with a number of prominent parts and equipment manufacturers, are housed under tents in what is termed "Velie Camp," near Moline, Ill. There are some 200 tents, each occupied by two men, and in addition a big tent in which the actual conferences take place. The two Velie four-cylinder models and the new Velie light "six" are likewise a part of the "big show."

Improvement in Mondex Shock Preventer.

By way of improving the efficiency of the Mondex shock preventer, which is marketed by the Aristos Co., of 254 West 54th street, New York City, the manufacturers of the device have made provision for easy insertion of lubricant between the working surfaces. Removal of a small screw inserted in the head of the king bolt permits grease or oil to be forced along a groove in the king bolt, whence it reaches small grooves cut in the surfaces of the brass planes. Although the shock preventer requires lubrication only about once in six months, the application of grease when needed has been made very simple.

Ford Acquires More New York Real Estate.

Although it only recently added four stories to its Long Island City (N. Y.) assembling plant, the Ford Motor Co. last week purchased the adjoining real estate, a plot 75 x 100 feet. It is Ford's second recent purchase in Long Island City.

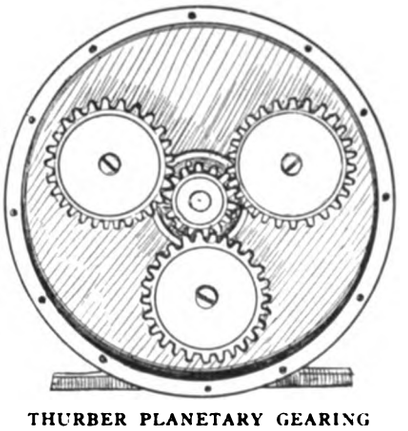
STARTING THE ENGINE WITH COMPRESSED AIR

Construction and Operation of Five Types of Pneumatic Starters Made Plain and Their Care Outlined—Advantages of Such Apparatus—Purposes of "Pop" Safety Valves and Why They Must Be Watched.

With the practical perfection of the electric lighting and engine starting system in all its various forms and its almost universal adoption by automobile manufacturers, other forms of starting apparatus have been more or less overlooked; due to the widespread publicity that has been given everything electrical, little attention has been paid to the possibility of its elimination—not that such action is entirely desirable—except for ignition, of course, and the substitution of something else, perhaps less complex, perhaps cheaper and probably just as efficient. Little cognizance has been taken of the so-called mechanical starter and its advantages have been obscured, rather than overshadowed, by the inherent advantage of the electrical apparatus which is apparent in the easy combination of both lighting and starting functions.

PHANTOM VIEWS SHOWING METHOD OF APPLYING THE THURBER AND DURNO AIR STARTERS

THURBER VANE MOTOR



That engine starters of whatever type they may be have advantages there is no gainsaying, for no internal combustion engine is self-starting, and to remove the necessity for manual labor and with it the possibility of injury to the operator as a direct result of such manual labor, is to bring about an advantage. As an engine, the gasolene automobile motor is incomplete; it requires the addition of something that will cause it to start at the will of the operator and with the least possible exertion on his part. And as the completed article, regardless of class, has peculiar advantages over that which is incomplete, so has the motor equipped with a starter, other than the time-honored and almost obsolete hand crank, advantages over the motor that is not so equipped.

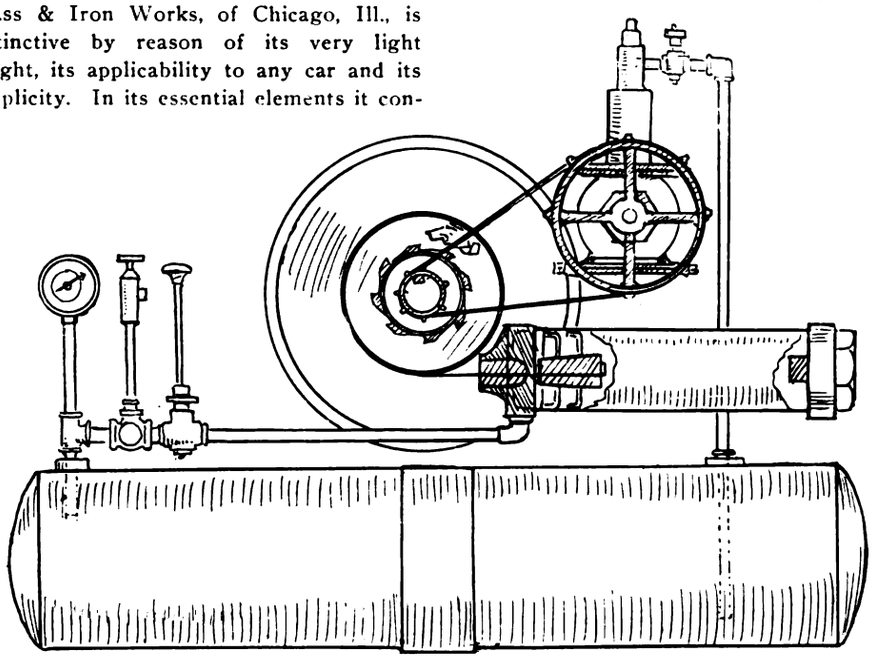
Simplicity of Mechanical Starters.

The genuine simplicity of electric lighting and engine starting apparatus was made plain in a series of articles which appeared in Motor World commencing September 26, 1912, and ending May 1, 1913, and in which the construction and operation and the care and repair of all such systems were described and illustrated in a manner never before attempted. Many of the various mechanical starters now available are no more complicated than are the electrical systems covered by that series of articles, though there are few persons who appreciate that fact. In fact, many of them are considerably simpler of attachment to existing cars than are the majority of electrical devices and, if for no other reason, it is meet that their construction and operation, their care and repair, should be better understood.

Obviously, however, it would be impossible to treat of them all in a single article without the danger of making it unduly long and sacrificing clarity and thoroughness to space. It is advisable, therefore, to divide them into classes and to study each class separately, for only in this way can confusion be avoided and comprehensive attention be given all the various systems, of which there are upward of a score.

Mechanical engine starters can be divided into three general classes: Pneumatic starters, spring operated starters, and lever or pedal operated starters. Starters in the first place can be further divided into those in which motion is imparted to the engine through the intermediary of a cable or some such device, as a chain, for instance, running over a pulley or a sprocket on the engine crankshaft with a piston and cylinder to give power; those in which a rotary air motor is used; those in which a small reciprocating air motor is geared to the engine either through the flywheel or through a chain to the crankshaft or the propeller shaft; and those in which some

THURBER PLANETARY GEARING



Digitized by Google

combination of any of these mechanisms is used.

Spring starters also are of several classees and may be divided into those in which the spring that imparts the starting energy is rewound by the engine and those in which the rewinding operation is performed by the momentum of the car. The designations pedal operated and lever operated serve to identify the divisions into which the third class of starters are divided.

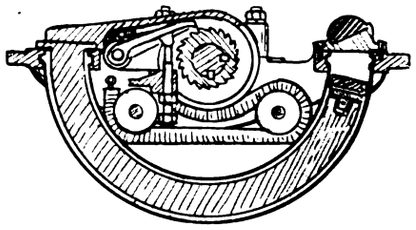
Flexible Piston Rod Turns the Flywheel.

Among the several pneumatic starters in the first class, the Vance, which is produced by the Chicago-Racine Aluminum, Brass & Iron Works, of Chicago, Ill., is distinctive by reason of its very light weight, its applicability to any car and its simplicity. In its essential elements it consists of a small power-driven air compressor, a long cylinder containing a piston that is connected to a ratchet drum on the crankshaft of the motor and an air storage tank, the whole layout being shown quite clearly by the accompanying illustration.

VANCE PNEUMATIC SYSTEM SHOWING PISTON AND PLUNGER AND PUMP

The pump, which is virtually the heart of the system, is a tiny little device with a bore and stroke of 1⅜ and two inches, respectively, though despite its small size it is capable of maintaining a constant pressure of up to 500 pounds in the air storage tank. The pump may be arranged to run constantly, in which case a "pop" safety valve set to blow off at any desired pressure is part of the equipment, or it may be arranged for manual control, in which case the operator switches on the pump when the pressure in the tank gets low and switches it off again when the required pressure is obtained. The storage tank measures 8 x 36 inches, and is tested hydraulically to 500 pounds pressure. One peculiarity of the tank is that the entering air passes through an oil seal which, it is claimed, filters the air and at the same time prevents leakage at the valve. The outlet is at the bottom, but an inside nipple reaches nearly to the top of the tank; thus no oil can be forced out.

The starter cylinder is a heavy, seamless brass tube with a cold-rolled steel head. The piston rod is unusual in that it is formed of a flexible steel ribbon which passes through a split bronze bushing in the cylinder head; to prevent the escape of air under pressure there is an oil-packed asbestos gland and a locking nut to tighten it. The plunger is a double one, consisting of two special cup leathers held by a steel piston with the lubricating compound between the two leathers; to this steel piston, the piston rod is connected.



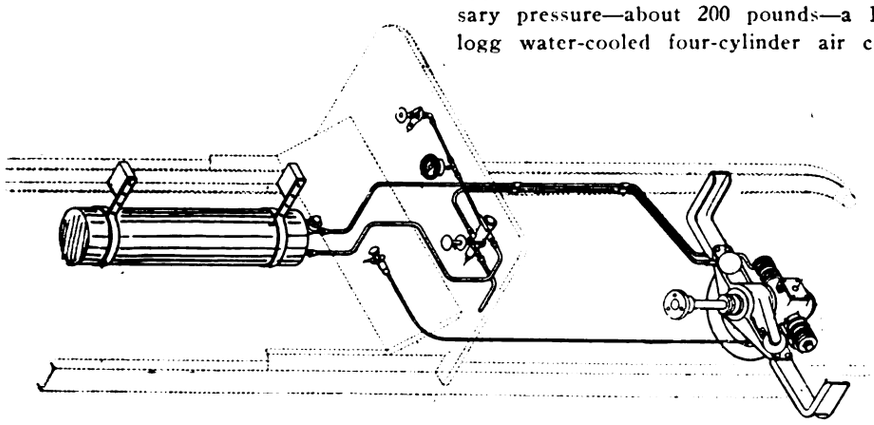
300 Revolutions a Minute on 40 Pounds.

The operation of the starter is very simple, and it is claimed that with 40 pounds pressure in the tank the average engine can be "spun" at from 300 to 400 revolutions a minute. Upon downward pressure of the starting valve, air under pressure is admitted behind the piston, thus drawing in the flexible piston rod and catching the ratchet on the drum attached to the engine crankshaft; to return the piston to its original and normal position there is a heavy tension spring which rotates the ratchet drum in the opposite direction and resets the starter for the next application. The weight of the whole outfit attached to the car is only 35 pounds.

The Durno compressed air starter, which is made by the Durno Mfg. Co., of Rochester, N. Y., and which is shown herewith in two sketches, is not unlike the Vance in its method of operation, though the design and construction are quite different. Instead of a ratchet arrangement on the end of the engine crankshaft, the Durno has a drum on which there is wound a chain which attaches to the piston of a cylinder beneath the car body. Depression of the starting valve admits air behind the piston, thus "turning over" the motor quite smartly, depending upon the pressure in the tank, of course. When pressure on the starting valve is released, the piston is drawn back to its original position with the aid of a spring. As the piston has a travel of 12½ inches in the cylinder and the diameter of the pulley on the crankshaft is only four inches, one movement of the piston suffices to rotate the crankshaft several times.

Employs a Crescent-Shaped Air Crank.

For raising pressure in the storage tank a Kellogg four-cylinder pump is provided and its operation is controlled manually from the dash by means of a lever. So that there may be no leakage of air during the time the car is stored over night, a shut-off valve, located close to the tank and ahead of all the other connections, is provided. The clutch which establishes the connection between the drum and the engine crankshaft operates quite automatically, picking up its work instantly the air pressure is turned on and dropping it when the valve is closed by the removal of the operator's foot. When this valve is closed, by the way, a special exhaust port is opened to relieve pressure behind the piston and permit the spring to do its work quickly.



CRESCENT AIR CRANK

The Crescent air system, which is produced by the Crescent Air System Co., of Detroit, Mich., though employing neither a reciprocating nor a rotary air motor, is quite different from either of the two systems described; it operates on the same general principle of a piston within a cylinder, however. Though each of the separate elements incorporates distinctive features, without doubt the engine starting device is the most unique of them all. Briefly, it consists of a crescent-shaped cylinder in which there is a piston, the arrangement of the component parts being best made plain with the aid of the accompanying picture. When a charge of compressed air is admitted behind the piston it is forced around, a pawl

Digitized by Google

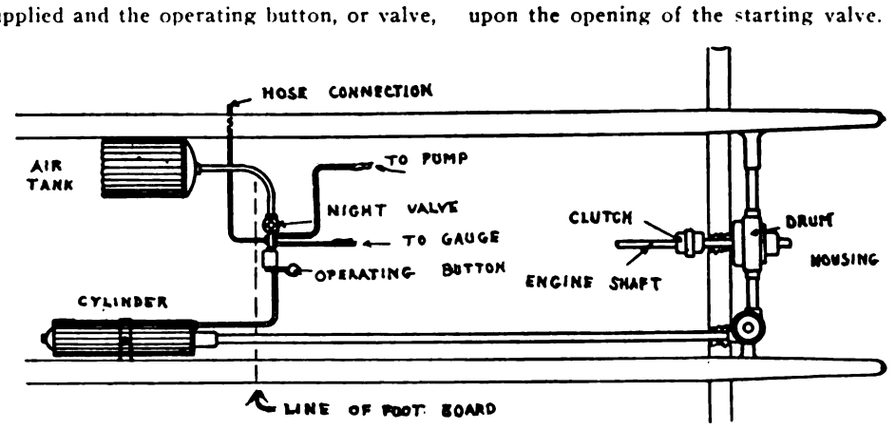
automatically engaging a ratchet wheel which takes the place of the ordinary starting crank. Immediately the piston reaches the other end of the cylinder, it is spring-returned automatically to its original position and the operation is repeated as long as the air valve is held open and there is air in the tank. One of the noteworthy features of the system is that the return movement of the piston is rapid enough to permit a continuous rotative movement being imparted to the crankshaft.

PERSPECTIVE VIEW OF CRESCENT SYSTE I AS APPLIED TO CAR

The air-compressor is of the two-cylinder opposed type and is air cooled, flanges cast on the cylinders assisting in the radiation of heat. The most distinctive feature of the compressor is its method of mounting and its drive. As may be seen by the accompanying pictures, it is mounted directly in front of the "air crank," as it is styled by the makers, to which it is attached. The engine shaft extends through the "air crank" to the compressor, connection being made by means of a clutch operated by the driver. The lay-out of the whole system as it is applied to a car is shown by the accompanying sketch.

Geared Down Vane-Type Air Motor.

The Thurber compressed air starter, several views of which are shown herewith—it is made by the Thurber Rotary Starter Co. of Detroit, Mich.—employs a rotary air motor and therefore is quite different from any of those previously described. This little motor is of the vane type, though instead of being operated by means of springs, as is the usual method, the vanes are positively operated by means of a concentric guide ring on the motor cover. Tightness at the joints between the vanes and the casing thus is ensured.



The rotary motor is connected to the crankshaft of the engine at the front, in place of the usual hand crank and to permit it to operate at comparatively high speed and consequently to develop considerable power it drives through the intermediary of a simple planetary gearing which is shown in one of the illustrations; the gear which connects with the engine crankshaft is not shown. In operation, air is admitted behind one of the vanes, thus rotating the central member until the second and then the third vane come into the working position. A simple roller clutch prevents damage to the starter from back-kicks.

The air reservoir measures 10 x 33 inches and may be mounted in any convenient place on the chassis; generally it is placed opposite to the muffler. To obtain the necessary pressure—about 200 pounds—a Kellogg water-cooled four-cylinder air compressor is supplied and may be attached to and driven from the engine in any convenient way. Just how the outfit looks on the average car is shown by the accompanying sketch, which makes quite clear the simplicity of the system. So that the operator may know at all times just how much air there is in the tank, a gauge is supplied and the operating button, or valve, generally is placed in the floor within easy reach of the driver's foot. Indicating that the average consumption of air per start is quite low, it is pointed out that with 150 pounds pressure in the tank a 40-horsepower motor has been started as many as 150 times without the necessity for operating the pump.

In the Merrall starter, which is manufactured by the Merrall Air & Steam Engine Co., of New York City, the starting motor is a clever combination of the rotary and reciprocating types, as is made plain by the accompanying sketches, which show both the internal and the external appearance of the device. The whole device is so simple that it should be easily comprehensible to any schoolboy who has ever possessed a toy steam engine, for it is in fact but little more than that. Its six cylinders are provided with pistons of the trunk pattern and all of them operate on the same crankpin.

Toy Steam Engine Principle Adopted.

Each of the pistons is pivoted to the rear wall of the casing, so that it is free to oscillate as the motor shaft is turned. A single port enters near the closed end of each cylinder and two ports, one for the exhaust and one for the intake, register with corresponding ports in the rear wall of the casing. As the crankshaft crosses the dead center with relation to any one of the miniature cylinders the port in the cylinder is registered with the corresponding inlet port in the casing wall and air under pressure is admitted to the cylinder, causing the piston to rotate the crankshaft. When the piston has reached the half-way point in its travel, the cylinder port has moved out of line with the inlet port and the expansive power of the compressed air is utilized to drive the piston the remainder of the stroke, when the exhaust ports register and the used air is exhausted. As six cylinders are provided, it is obvious that in any position of the motor shaft at least two of the cylinders must be on the working stroke and starting must be the inevitable result upon the opening of the starting valve.

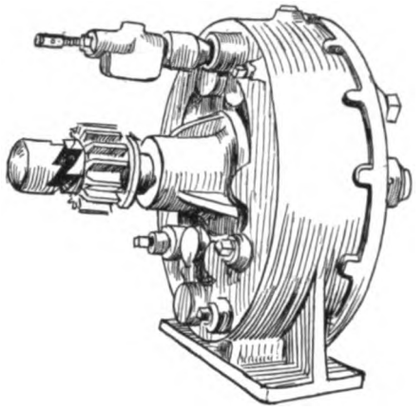
PLAN VIEW OF THE DURNO SYSTEM SHOWING COMPONENT PARTS

Unlike the other starters that have been described, the Merrall device can be attached to the gasolene motor in any one of several ways, though the preferred method is to mount it adjacent to the flywheel through which it drives by means of gearing. To prevent damage to the device as the result of back-kicks from the engine, a simple clutch is provided. Where a compressor is supplied with the system, it is cast integral with the motor case and comprises two horizontally opposed cylinders. With-

Digitized by Google

out the compressor, however, the starter can be operated by spent gas taken from one of the cylinders and stored in a reservoir beneath the car. The device, it is claimed, will start the average motor some 20 times on as little as 30 pounds air pressure, and on 100 pounds pressure it will develop 3½ horsepower. Complete with a pressed steel tank measuring 7 x 48 inches, the outfit weighs approximately forty pounds.

Advantages of Compressed Air "on Tap."

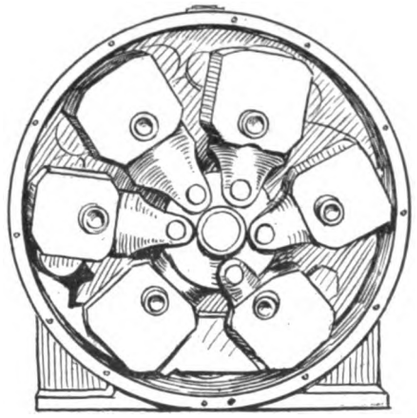


One of the particular advantages of any air system, of course, is that it provides air for the inflation of tires, and as tires always require to be inflated at stated intervals, this is an advantage that cannot well be overlooked. If a power pump is carried to inflate tires, then that pump may as well be put to other uses, among which well may be the starting of the motor. Incidentally, compressed air at the command of the driver furnishes him with power to jack up his car in a jiffy, to blow a loud-sounding whistle or to clean the dust off upholstery quickly and easily. Also, a leak in an air system may do no more serious damage than to inconvenience the driver, whereas a leak in an electric system might cause expensive damage to the battery or to any of the other parts. Such leaks are anticipated, of course, and are provided against by the use of fuses.

In the care and repair of any compressed system the first consideration always should be to see that all joints are kept tight; loose joints probably cause more trouble than does anything else. If the installation is not made at the factory of the maker, such joints should be made up, as plumbers say, with either white or red lead or shellac and should be pulled as tightly as possible without danger of stripping threads. The second consideration should be to see that all valve seats are in proper order—that they are not pitted or corroded and that they actually hold air. Valves that are in bad condition can be ground in in the same way that engine valves are ground, only care must be taken to see that the seats are not scratched in case the valves are made of brass.

Care Needed to Ensure Good Service.

In the Vance system, which was described first, care must be taken to see that the oil level in the bottom of the air reservoir is maintained at the proper height, for upon this depends the length of time the tank will hold air; the same obtains in the case of the Durno. The flexible piston rod of the Vance may require a few drops of oil from time to time, and great care must be taken to see that the compressor is properly lubricated, for if it runs continuously damage otherwise is likely to result. Oil holes are provided and the instructions of the manufacturer should be followed implicitly.



Instructions for the care of the Durno starter are few and best can be expressed in the words of the maker: "Once a year pack pulley housing with grease. Twice a year put wineglassful of oil in oil hole in night valve, taking care to replace the one-

EXTERIOR OF MERRALL STARTER

eighth inch plug securely. The pump will require oiling about once a month."

The compressor of the Crescent system will require to be oiled occasionally, according to the instructions of the maker, and the air crank only at long intervals. Otherwise there is nothing for the operator to do but to make sure, occasionally, that all the air connections are tight; they need not be touched, of course, unless the starter gives indication of failing power or the tank will not retain its charge of air.

INTERIOR OF MERRALL STARTER

Instructions for the care of both the Thurber and the Merrall are the same as those for the Crescent, except that the Merrall casing is packed with grease and need not be touched from one season's end to the next.

A word with regard to "pop" safety valves, where they are employed: These devices are safety devices, as their name indicates, and they should be examined from time to time—they should never be permitted to go without attention more than a month—and the operator should make certain that they are operating properly by pumping the tank pressure slightly higher than that for which the valve is set. If the valve "blows off," all is well and good, but if it does not do so it should be taken apart if necessary and cleaned thoroughly, for the life of the persons in the car may depend upon its action. Sometimes when a "pop" valve sticks a slight tap with a light hammer near the valve will loosen it, though a fault of the kind should be taken as an indication that the valve requires cleaning.

Gould Develops New Starter Battery.

That the rigorous service to which the storage battery for electric lighting and engine starting purposes is put, the alternate heavy drain and idle period and the continual jar and vibration, requires special construction—that no ordinary battery developed for other uses can be expected to "stand up" for long under such conditions—long has been known to battery builders, and among those who have brought out batteries especially designed for this work is the Gould Storage Battery Co., of New York, which just has placed on the market a new type of battery, which is designed for the maximum resistance to wear and to abuse.

The principal difference between the new battery and its predecessors is in the active material in the plates. In the positive plates this material is very hard and dense and is closely bound so that only a thin surface layer is softened when the plate is developed for service. As the plate wears in continued service more of the mass gradually is softened and the result is that the capacity of the battery is retained practically throughout its life. In the negative plates, the material has been proportioned to resist any tendency toward shrinkage during the life of the plate, and the mass is calculated to retain its initial hardness for long periods. The cells are contained in hard rubber jars which, in turn, are sealed in hardwood boxes in such a way that creeping and consequent corrosion are effectually prevented. Connections are unusually heavy and are placed in an accessible position.

To Prevent Silver from Tarnishing.

In order to prevent the silvering of lamp reflectors from tarnishing when not in use it is a good scheme to give the surfaces a light coating of alcohol in which a little collodion has been dissolved. This will form an excellent protection, and is easily washed off with warm water. Of course, any polished metal surface can be protected in the same way.

WINS NATIONAL TOUR WITH FOUR-YEAR-OLD LOCOMOBILE

(Continued from page 15.)

roads encountered. In the afternoon when running parallel to the Missouri river a half-mile stretch of real mud was encountered and some of the cars floundered around in it and lost much time, which later was made up, despite a number of steep hills and rough spots. None of the drivers was penalized.

The eighth day of the tour, which led the tourists over the 156 dusty miles between Glasgow and Havre, Mont., was virtually a repetition of the seventh day, with hours of running over flat plains that offered very little in the way of scenery and very much in the way of dust and discomfort. Along nearly the whole of the day's trail there were camps of the government reclamation service force, and for the first time glimpses were caught of prairie-dog towns, where hundreds of the little animals sat up on their haunches and barked at the passing cars. Although the hills were steep in the late afternoon, none of the cars had trouble in negotiating them, and all of them got in on time; which means that there were no penalizations. When the cars arrived in Havre, by the way, they were met by a delegation of 20 ladies dressed in white who presented bouquets to all the passengers.

The actual finish of the tour was about as spectacular an event as took place during the whole of the trip from the beautiful Mississippi Valley to the West. Dr. Park, who had been driving consistently but who had lost 15 minutes because of tire trouble on the last leg of the run, tore through the low-lying foothills for the last 21 miles in an effort to make up that time, and when he crossed the finish line he had only one minute to spare. A little later, Warren Munzer, in one of the diminutive Krit cars, rushed over the line with both rear tires flat and flapping; he had no time to repair them and rather than check in late he drove with them as they were and arrived in time.

Far outside of Glacier Park, the tourists were met by a band of fully 100 Indians in full regalia, and with them as an escort the procession wended its way into the reservation and, when the cars finally were brought to a halt in front of the hotel, every window framed eager faces and the roads were lined by those who had been expecting the tourists ever since they started, eight days before. Following the final checking-in process, the band dispersed, some to remain awhile to view the wonders of the park, some to travel still further westward and some to hit the homeward trail.

EAST INDIAN STATE AIDS EMPLOYES IN CAR BUYING

Mysore, in India, Advances Salaries for the Purpose but Takes Title to Vehicles — Prejudice Against Red Cars.

Reporting that the "general conditions throughout southern India are highly favorable for rapidly developing trade in motor cars and motorcycles," Henry D. Baker, who is performing special service in India and Ceylon for the United States government, cites a remarkable example of the manner in which one of the Indian States is encouraging the use of such vehicles—a scheme of making advances of money or salary to State employees for the purchase of either motors cars or motorcycles.

"The new scheme will make it easy for the higher-salaried officials to purchase motor cars and for employees of lower salaries to purchase motorcycles," writes Baker. "For the purchase of motor cars a grant of $1,334 is to be given, or four months' extra salary, whichever is the lower, and for the purchase of motorcycles and side cars a grant will be allowed of $500, or four months' salaray, whichever is the lower. In either case the money thus advanced is to be repaid to the government in 36 monthly installments without interest. The loan will be secured by a mortgage which the government will hold on the motor car or motorcycle purchased. Thus the motor vehicle can be put to use at once, but the expense will not have to be entirely met for three years.

"The government of this native State of Mysore, which is next to Hyderabad as regards population, area, and general importance among the independent native States of India, is noted for its progressiveness, and in initiating this plan of encouraging the use of motor vehicles among its employees it has been actuated by a desire to increase the efficiency of the public service, and especially to make it easier for government officials to go to and from their work with little loss of time and to attend to official services outside their offices with greater celerity. The fact also that such motor vehicles may provide the opportunity for wholesome recreation outside of working hours, and also may make it possible for government employees to live at longer distances from their work, where rent may be cheaper and better homes obtainable, has furnished another motive to the government for the adoption of this interesting scheme.

"Of course, the purchase of a motor car or motorcycle will depend upon the amount of the employee's salary, as an advance cannot be obtained for an amount larger than the total salary for three years. There are over 1,000 persons on the Mysore government civil list, most of whom draw salaries which will readily permit them to take advantage of the government's plan for granting loans for the purchase of motor veheicles. [Baker's report was accompanied by a copy of the last quarterly civil list of the Mysore government, which may be of interest to American manufacturers of motor cars and motorcycles, as it contains the names of officials of the Mysore government, and also the amount of monthly salaries they receive. This list will be loaned to interested manufacturers by the Bureau of Foreign and Domestic Commerce.]

"I understand that there is already a very great number of applications by Mysore government officials to obtain the advances necessary to equip themselves with motor vehicles. I am also told that the governments of other States of India are now considering the same plan, and that its widespread adoption throughout India is a possibility of the future."

Baker reports that there is only one American motorcycle represented in India and adds:

"Local dealers have informed me that American manufacturers should not send red motorcycles to India, the red color of one American car now offered here having greatly interfered with its sale and offsetting other special advantages, such as the fact that it is unusually well sprung.. These motorcycles should be either black, blue, or slate color.

"Over all India, red is the color of official service, and persons in red uniform in the service of the government who might be using motorcycles do not seem to wish their machines to match their clothing, nor do persons not in the public service wish to ride motorcycles of a color which might suggest that they are postmen or policemen, or other persons engaged in government service.

"Side cars for motorcycles are very much used in southern India, especially by Europeans, who like to have such provision for taking their wives or children out with them; in fact, it is doubtful if motorcycles would have much sale here without such provision for side cars. As most of the motorcycles in use are of English manufacture, it might be well for American manufacturers to follow the English patterns for side car equipment and attachment, as dealers already stocked with English side cars would not then be prejudiced against American motorcycles because of the difficulty of fitting these side cars to the British machines."

1,044,528. Spark Plug. Ezra F. Hopkins, Chicago, Ill. Filed Nov. 28, 1910. Serial No. 594,421. (Plug with adjustable gap.) 4 claims.

1,044,569. Carburetter. Fredereic Stanton Perrin, New York, N. Y. Filed Oct. 12, 1909. Serial No. 522,282. (Spray nozzle with slit, and movable port-plate to regulate opening.) 4 claims.

1,044,576. Carburetter. Jerome E. Russell, Rudd, Iowa. Filed Feb. 5, 1912. Serial No. 675,666. (Spray nozzle opening into air passage separate from main air passage.) 4 claims.

1,044,594. Carburetter. Charles M. Stroud, Minneapolis, Minn. Filed Jan. 17, 1910. Serial No. 538,484. (Carburetter with constant-level pool of gasolene upon which air impinges 4 claims.)

1,044,619. Resilient Hub for Vehicle Wheels. Edward Yoder, Tulsa, Okla. Filed May 28, 1912. Serial No. 700,207. (Hub cushioned by flat leaf springs.) 3 claims.

1,044,692. Vehicle Spring. Percival L. Rookledge and George W. Gillespie, Cambria, Cal. Filed Nov. 30, 1910. Serial No. 594,985. (Two superposed semi-elliptic springs linked to an intermediate flat spring.) 12 claims.

1,044,699. Wheel. Frank J. Singler, Irving, Ill. Filed Oct. 24, 1911. Serial No. 656,460. (Resilient wheel with curved spring spokes.) 3 claims.

1,044,703. Tire Protector. Simon Stern, Albuquerque, N. M. Filed Dec. 16, 1910. Serial No. 597,710. (Tire armor of wire fabric.) 1 claim.

1,044,709. Oil Feeding System for Internal Combustion Engines. Willard Irving Twombly, New York, N. Y., assignor to Twombly Motors Co., New York, N. Y., a corporation of New York. Filed March 6, 1911. Serial No. 612,666. (Lubricating system with cam-operated valveless plunger pump.) 4 claims.

1,044,755. Oil Engine. James William Cross, London, England, assignor to the Westinghouse Brake Co., Ltd., London, England. Filed May 17, 1910. Serial No. 561,795. (Air-valve arrangement for oil engine with hot combustion chamber.) 2 claims.

1,044,779. Tire Signal. George T. Hackley, Los Angeles, Cal. Filed Dec. 14, 1910, Serial No. 597,362. Renewed April 11, 1912. Serial No. 690,181. (Visual indicator for giving warning of escape of air from tire.) 19 claims.

1,044,846. Hydraulic Change-Speed Gear. Marius Barbarou, St. Denis, France, assignor to Societe Anonyme des Automobiles Delaunay-Belleville, St. Denis, France, a corporation of France. Filed Dec. 8, 1910. Serial No. 596,213. (Means for maintaining tight joints in distributer plates of hydraulic transmission.) 6 claims.

1,044,888. Wheel Tire. Frank Householder, Guthrie, Okla. Filed April 17, 1911. Serial No. 621,556. (Resilient tire with internal hoop springs.) 3 claims.

1,044,894. Effort Transmitting Frictional Device. Harry Ward Leonard, Bronxville, N. Y. Filed Aug. 11, 1903. Serial No. 169,071. (Adjustable governor for dynamo clutch control.) 36 claims.

1,044,898. Fluid Pressure Controlling System for Motor Vehicles. Alexander Grant McGregor, Salt Lake City, Utah. Filed June 14, 1910. Serial No. 566,893. (Brake operated by air or other fluid pressure.) 4 claims.

1,044,900. Vehicle Curtain. Theodore C. Merz, Detroit, Mich., assignor of one-half to Solomon E. Heineman, Detroit, Mich. Filed July 15, 1912. Serial No. 709,322. (Curtain with folding window with weatherproof frame.) 4 claims.

1,044,901. Steering Indicator. Frank B. Mills, Chicago, Ill. Filed Feb. 7, 1912. Serial No. 676,075. (Electric signal to indicate direction of steering.) 2 claims.

1,044,919. Sanding Device for Automobiles. Lester W. Samuels, New York, N. Y. Filed July 26, 1912. Serial No. 711,748. (Hollow mudguard containing sand and spout to discharge on rear wheels.) 2 claims.

1,044,951. Resilient Wheel. Theodore Eddy Van Derwerken, Green Island, N. Y., assignor of one-half to James E. Brooks and Charles C. Finch, Albany, N. Y. Filed Aug. 12, 1911. Serial No. 643,798. (Wheel with double rim and interconnected springs between rims.) 5 claims.

1,044,952. Starting Device for Explosive Engines. Lewis C. Van Riper, New York, N. Y. Filed Sept. 12, 1910. Serial No. 581,600. (Anti-kick crank with friction engagement.) 15 claims.

1,044,973. Spring Wheel. George F. Barnes and Willis A. Suttle, Freestone, Tex. Filed May 20, 1912. Serial No. 698,532. (Wheel with radial springs and rubber cushions.) 4 claims.

1,045,008. Dirigible Headlight. James Austin Ellison, Wilmington, Del. Filed April 10, 1912. Serial No. 689,714. (Headlight moved in consonance with movement of steering gear.) 12 claims.

1,045,018. Demountable Rim. Edgar L. Gold and Jacob H. Messinger, Nazareth, Pa. Filed May 2, 1912. Serial No. 694,787. (Quick detachable rim and fastenings.) 1 claim.

1,045,041. Starting Crank for Explosive Engines. Hermann H. Kolb, Badger, Iowa. Filed March 28, 1912. Serial No. 686,853. (Starting crank with pivoted handle held by adjustable spring.) 3 claims.

1,045,061. Cooling Device for Gas Engines. Charley A. Myers, Lexington, Neb. Original application filed July 2, 1910, Serial No. 570,147. Divided and this application filed Sept. 25, 1911. Serial No. 651,148. (Driving gear for a plurality of cooling fans.) 3 claims.

1,045,067. Motor Vehicle. Robert J. Nichols, Berlin, Ga. Filed May 29, 1911. Serial No. 630,169. (Friction driving gear for winding drum on rear of car.) 1 claim.

1,045,076. Shock Absorber. Richard Pope, Brisbane, Queensland, Australia. Filed Jan. 11, 1912. Serial No. 670,638. (Rack-and-pinion gearing actuating frictional device on a shaft.) 3 claims.

1,045,852. Lens and Reflector Retainer for Lamp Doors. William T. Jones, Detroit, Mich., assignor to the Edmunds & Jones HMfg. Co., Detroit, Mich., a corporation of Michigan. Filed Sept. 11, 1911. Serial No. 648,752. (Reflector and lens fastened to door of lamp.) 10 claims.

1,045,859. Ignition Device for Gas Engines. (Leon J. le Pontois, New Rochelle, N. Y., assignor, by mesne assignments, to H. W. Johns. Filed Oct. 21, 1908. Serial No. 458,773. (Make-and-break ignition system with magnetic breaker.) 9 claims.

1,045,861. Side Curtain Support for Vehicles. Allen Loomis, Detroit, Mich., assignor, by mesne assignments, to Packard Motor Car Co., Detroit, Mich., a corporation of Michigan. Filed Nov. 6, 1908. Serial No. 461,373. (Curtain support mounted on side door.) 15 clams.

1,045,922. Steering Gear. Charles Henry Willard, Pasadena, Cal., assignor of one-half to Dora Rowley, Gila Bend, Ariz. Filed Sept. 28, 1911. Serial No. 651,806. (Four-wheel steering gear.) 3 claims.

1,045,955. Pneumatic Tire. Fark A. Dees, Pascagoula, Miss., assignor to American Tire Co., St. Louis, Mo., a corporation of Missouri. Filed Jan. 3, 1911. Serial No. 600,449. (Repair patch for pneumatic tire.) 3 claims.

1,045,966. Starter for Explosive Engines. Judson E. Galtra, Adrian Minn. Filed March 4, 1912. Seria. No. 681,479. (Compressed air starter.) 3 claims.

1,045,992. Motor Truck. James W. Linn, Oregon City, Ore. Filed Dec. 29, 1910. Serial No. 599,835. (Motor vehicle in which front axle of trailer forms rear axle of truck proper.) 3 claims.

1,046,010. Automatic Controlling Device for Vehicle Lamps. Oliver W. Page, Ione, Wash. Filed Sept. 28, 1911. Serial No. 651,800. (Means for moving headlights concurrently with steering gear.) 1 claim.

1,046,030. Engine Starter for Automobiles. Wm. A. Sharpe, Denver, Col., assignor to the S. & S. Auto Starter Co., Denver, Col., a corporation of Colorado. Filed Oct. 16, 1911. Serial No. 654,988. (Anti-kick crank with ball-ratchet mechanism.) 10 claims.

1,046,090. Pneumatic Spring for Vehicles. Richard Liebau, Watervliet, N. Y., assignor to the Westinghouse Air Spring Co., a corporation of Pennsylvania. Filed Jan. 21, 1908, Serial No. 411,894. Renewed March 9, 1910. Serial No. 548,262. (Pneumatic cushion of cylinder-and-piston type.) 7 claims.

1,046,091. Pneumatic Spring for Vehicles. Richard Liebau, Watervliet, N. Y., assignor to the Westinghouse Air Spring Co., a corporation of Pennsylvania. Filed Jan. 21, 1908, serial No. 411,893. Renewed March 9, 1910. Serial No. 548,261. (Pneumatic spring of cylinder-and-piston type.) 9 claims.

1,046,093. Cape Cart-Hood. Reginald Walter Maudslay, Coventry, England. Filed Jan. 17, 1912. Serial No. 671,582. (Door in side curtain swinging with car door.) 2 claims.

1,046,111. Carburetter. Carl F. Schulz, Brooklyn, N. Y. Filed Aug. 21, 1911. Serial No. 645,099. (Carburetter with air and fuel valves connected by fulcrumed lever.) 15 claims.

1,046,141. Gas-Mixing Valve for Explosive Engines. Adolph Becker, Wheeling, W. Va., assignor to Albert M. Schenk, Wheeling, W. Va. Filed Jan. 4, 1912. Serial No. 669,382. (Carburetter of the mixing valve order.) 9 claims.

1,046,156. Variable Speed Transmission Mechanism. Charles A. Dreisbach, New Haven, Conn. Filed Oct. 11, 1911. Serial No. 653,984. (Worm and gear drive with roller pins in gear and movable worm with varying pitch.) 3 claims.

1,046,201. Automobile Body. Albert Kraetzer, Chicago, Ill. Filed Jan. 24, 1911. Serial No. 604,348. (Seat one arm of which constitutes a door.) 5 claims.

1,046,220. Engine. Ernest E. Proulx, Williamsett, Mass. Filed Feb. 21, 1912. Serial No. 679,001. (Rotary cylindrical valve on cylinder heatd.) 6 claims.

1,046,256. Brake. Preston H. Breed, Pittsfield, Mass., assignor, by mesne assignments, to Alden Sampson Mfg. Co., a corporation of New Jersey. Original application filed Sept. 1, 1909, Serial No. 515,650. Renewed July 13, 1911, Serial No. 638,396. Divided and this application filed May 9, 1910, Serial No. 560,224. Renewed Feb. 24, 1912. Serial No. 679,768. (Sampson cam-operated brake mechanism.) 4 claims.

1,046,272. Emergency Traction Device. Frank B. Comins, Sharon, Mass. Filed March 11, 1912. Serial No. 683,062. (Chain-link mat.) 2 claims.

1,046,273. Motor-Vehicle Suspension. Kenneth Crittenden, Detroit, Mich. Filed July 12, 1910. Serial No. 571,550. (Single cross-spring rear suspension.) 3 claims.

1,046,277. Starting Mechanism for Internal-Combustion Engines. Charles A. Deal and Marvin E. Cox, Los Angeles, Cal. Filed Aug. 1, 1911. Serial No. 642,893. (Lever starting mechanism with friction clutch.) 3 claims.

1,046,280. Internal Combustion Engine. Victor J. Diefenderfer, Allentown, Pa., assignor of one-third to Charles E. Lehr, Bethlehem, Pa. Filed Oct. 30, 1911. Serial No. 657,395. (Rotary engine with two rotors and an intermediate rotating valve, one rotor for pumping and compressing and the other for explosion.) 6 claims.

1,046,289. Spring Wheel. Edwin Lewis Goltry, Red Oak, IoIwa. Filed Feb. 3, 1912. Serial No. 675,113. (Disk wheel with enclosed curved springs supporting tire.) 1 claim.

1,046,331. Motor Arrangement for Vehicles of All Kinds. Theodor Reuter, Winterthur, Switzerland. Filed Aug. 31, 1910. Serial No. 579,929. (Pneumatic power transmission system.) 13 claims.

1,046,344. Carburetter. John K. Stewart, Chicago, Ill. Filed July 27, 1911. Serial No. 640,749. (Carburetter with heating coil in annular chamber surrounding mixing chamber.) 5 claims.

1,046,434. Carburetter. Leon Bollee, Le Mans, France. Filed April 7, 1909. Serial No. 488,348. (Multiple carburetter system.) 1 claim.

World's Stock Champion

Fastest Stock Mile

National

World's Fastest 500 Miles in Competition

"Once a National dealer, always a National dealer"

Electric Started and Lighted. Not only left side drive, but *access* to both front doors

Five Models, $2750 to $3400

National Dealers Stick

THE dealers who form the great National Sales Organization go right along year after year building up a permanent, profitable business for themselves.

There's as fine a group of "live wires" in the National Sales Organization as ever did business under one pennant—just the kind of motor car sales specialists with whom you would be proud to be associated.

They enjoy year-round business. They are free from "come-backs;" their sales remain sales; their profits stay profits. They are backed by a reliable, here-to-stay company that has the confidence of the public.

Here may be a big opportunity for you

It depends where you are located. If you happen to be doing business in open *National* territory, you are particularly fortunate at this time.

We are in a position to add to our present Dealers Sales Organization a limited number of "live wires"—men who know how to sell automobiles and who have *made good*.

Simply prove to us that you are the red-blooded dealer we are looking for, and we will satisfy you beyond the shadow of a doubt that we have the car *you* want to represent.

Just take that telegraph blank in the upper left hand pigeon hole of your desk and send us this message collect: "Will be in Indianapolis ——— to visit your factory and look over your new models"—and we'll meet you at the depot in a *National*. If you can't come now—let us know by return mail and we will send you instantly complete specifications, illustrations of various models, prices and our liberal offer to Live Dealers.

Your request for information does not obligate you in any way, so let us hear from you by return mail—or, we would rather receive the telegram.

Elyria-Dean

TRADE MARK

Now the TUTO HORN is within the reach of every car owner

Improvements and Manufacturing in Large Quantities makes it possible to furnish the Genuine $25.00 TUTO for $15.00. This new price includes all of the Exclusive features that have made the TUTO horn so practical and popular:

$15.00

Two-tone Feature—Low note for regular service—loud note for emergencies—from one horn and one button.

Instantaneous Action—No loss of time for motor to "speed up."

Steering Wheel Fixtures—Protects the cord—gives neat, permanent job.

Button Always Under Thumb—Gives quick action in case of emergency.

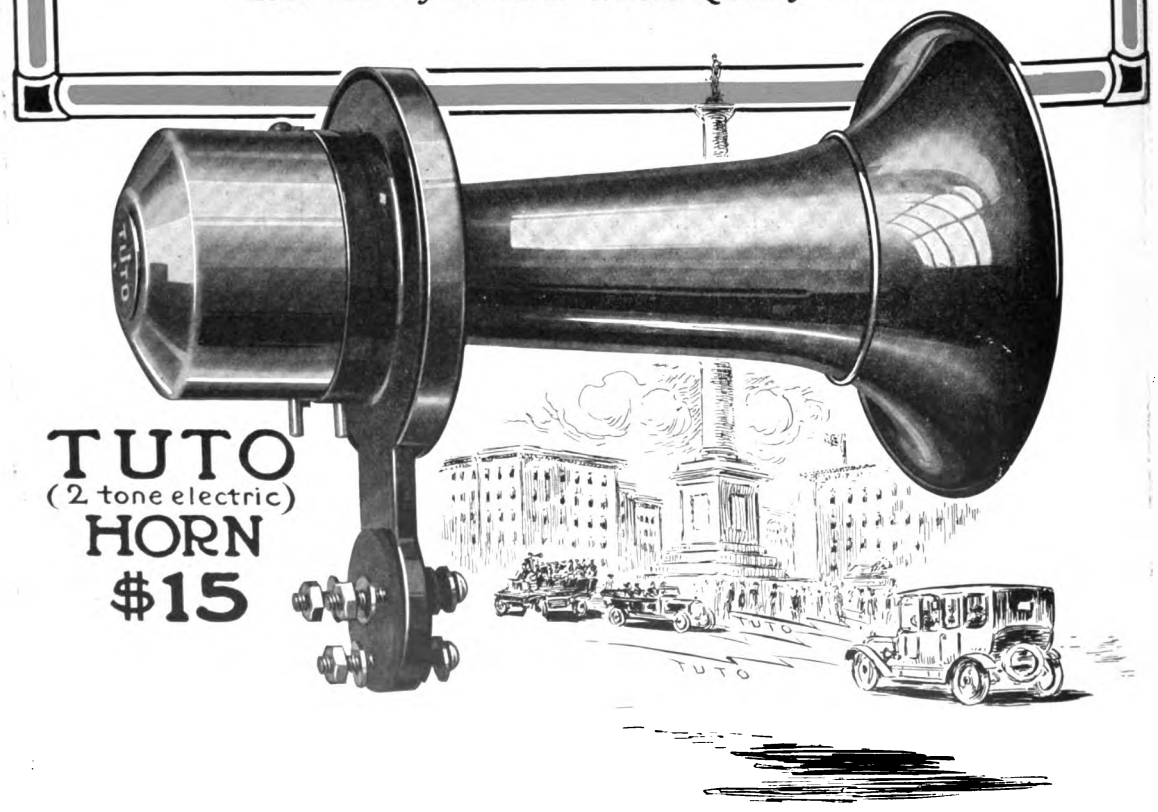
Automatic Operation—Unconscious gripping of button upon approach of danger forces button clear down and gives loud note—instantaneously. No hesitating, no selecting of horn buttons, etc.

Reliability—Always responsive, as same button, cord and horn are used for both notes, thus are self-testing. There is nothing to oil or clean, so neglect will not interfere with operation or ruin the working parts, the same as in mechanical or motor horns.

Liberal Guaranty—Guaranteed indefinitely against inherent defects or breakage of parts due to such defects. We always give the customer the benefit of the doubt.

No Experiment—The Tuto Horn has been marketed for three years and has given unusual satisfaction through its reliability and freedom from trouble. This is proven positively by our records, which show that we have been called upon by less than 1% of Tuto owners for advice or repair parts.

Once a Tuto User, always a Tuto Advocate



Tuto users never can go back to the old bulb horn or to the Slow Accelerating Motor Horn.

Cadillac 1914

Cadillac leadership in scientific motor car development is once more strikingly demonstrated

A new element of efficiency ***A new quality of luxury*** ***A new source of economy***

Each year you have looked to the Cadillac for the real and substantial progress in motor car development.

You have looked to the Cadillac for the great essentials in the practical motor car.

And you have not looked in vain.

Now conceive, if you can, a Cadillac with its essential functions sharpened, accentuated and refined.

Conceive such a process of refinement culminating in an entirely new riding quality of unexampled ease.

This is precisely what has come to pass in this new car.

The principal contributing factor—the two speed direct drive axle—is described in detail elsewhere.

The Cadillac Delco electrical system of automatic cranking, lighting and ignition, the first practical system ever made and first introduced by us, has, after experience with it on 27,000 Cadillacs, been still further developed, improved and simplified and the slight attention required from the user materially reduced.

The carburetor has been improved, its efficiency and its well-known economy increased. It is hot water jacketed and electrically heated to facilitate starting in cold weather.

The rear springs are six inches longer.

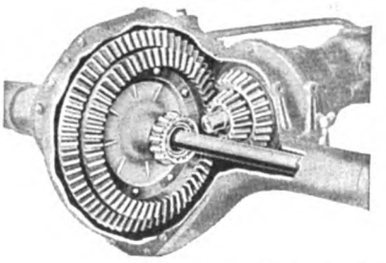
The body designs are new and strikingly handsome.

Front seat passengers may enter or leave the car at either side.

These and many other refinements of essential details make for a greater and a better Cadillac and serve to more firmly establish its position as America's leading motor car.

The Cadillac Company has never disappointed you in the smallest particular or in a single promise.

We promise you again, in this new car, a positive revelation in motor car luxury.



Cadillac two-speed direct drive axle

The advantages of this axle do not lie in its being an improvement so far as its functions as an axle are concerned, but rather in the manifold advantages attained in other directions through the medium of the axle.

In place of the single bevel pinion and single bevel driving gear common to ordinary construction, there are two bevel pinions and two bevel driving gears. This affords two different gear ratios, each driving direct from the engine to the axle without intermediate gearing.

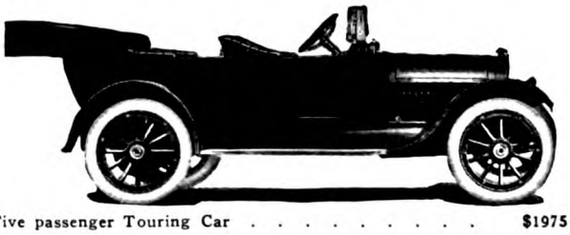
The usual single direct drive gear ratios range from about 3.5 to 1 down to 4 to 1 according to the car. Any single gear ratio is necessarily what it is because a single gear ratio must be, or should be, the particular one which is best adapted for all around general use.

No one single gear ratio can possibly be just right for all speeds and for all conditions. But by using two direct gear ratios we have exactly doubled the efficiency as it concerns the relation of power developed by the engine to the economical and efficient application and transmission of that power to the driving of the car.

In the new Cadillac axle we have, as before stated, two direct-drive gear ratios. The low direct drive gear, which is 3.66 to 1, is especially adapted for city driving, where starting, stopping and slowing down are frequent and where cautious operation is necessary.

The high direct drive gear ratio, which is 2.5 to 1, is of special advantage where speeds of about 16 miles or more per hour are permissible and desirable.

The change from one gear ratio to the other is made by means of a simple, convenient electric switch.



The advantages of the high direct drive gear ratio lie primarily in the fact that with it, any given speed of the engine produces an increase of about 42 per cent in the speed of the car. For example: at an engine speed of 700 revolutions per minute, with the low direct gear engaged the car will travel approximately 21 miles per hour; while on the high direct gear it will travel approximately 30 miles per hour with no increase in engine speed.

This great increase in car speed in its relation to engine speed accomplishes a number of desirable things.

Among these is a decrease in gasoline consumption for a given mileage. This is due to the fact that with the engine turning over slowly—comparatively speaking—a given quantity of gas is utilized to greater advantage and generates more actual power than with the engine turning over more rapidly. Friction also is materially reduced by reason of the parts operating more slowly and this, too, is a factor in reducing gasoline consumption when driving on the high gear.

Another great advantage is that with this direct drive high gear ratio, there is obtained an extraordinarily luxurious smoothness in running, together with a marked quietness and a comparative freedom from the vibration which, to a greater or less extent, is ever present when traveling at high speed with a low gear ratio.

In attaining these much desired qualities, instead of adding complications to the power plant which make for greater fuel consumption and for greater upkeep expense, they have been attained by methods which are strikingly the reverse, viz. by methods which lessen the fuel consumption, methods which decrease friction with its resulting wear and methods which make for longer life, together with an appreciable decrease in the cost of operation and maintenance.

Booth FELT

THE material from which Booth Felt Washers and Gaskets are made is the best grade of all-wool felt. Difference in materials is what makes the difference in the cost of washers.

Difference in materials is what makes a good or poor washer.

We make cheap washers as well, but for automobile work we strongly recommend the use of nothing but Booth all-wool felt washers. The difference in the cost between cheap shoddy washers and Booth Felt Washers is practically nothing per car—and no great item even for a year's output.

The trouble Booth Felt Washers save your dealers and customers makes the use of shoddy washers poor economy.

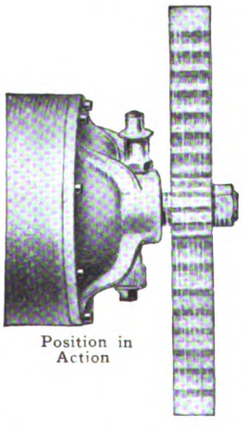
RUSHMORE



PERFORMANCE

Recent tests of a Model B Rushmore Starter, embodying our latest refinements in construction, show that our previous statements as to its power were too modest.

The tests were made by a leading automobile manufacturer, on a 6-cylinder car of 4½ x 5½ inches, bore and stroke. Using 100 amperes at 5.6 volts, the Starter turned the engine over steadily at **108 R.P.M.** (We have hitherto claimed only 80).

With three passengers, in fourth gear and with full compression in the cylinders, the Starter propelled the car on a level dirt road at about 3 miles per hour, taking a current of 126 amperes at 5.5 volts.

In first gear, with the same passengers, the Starter propelled the car up a runway of 20 per cent. grade into a second-story shop, taking a current of 350 amperes.

Position in Action

The Starter used in these tests weighs 47 lbs. complete without switch. It acts directly on the flywheel, without intermediate gears.

Another make of starter, weighing nearly 70 lbs. and having a very well-built hard steel and ball-bearing reducing gear made by the car manufacturers, turns the same engine at only 75 R.P.M., using the same current and voltage. Thus the Rushmore equipment shows 44 per cent. higher speed with a much lighter weight.

Even with equal current, the Rushmore Starter would save the battery very greatly by giving a snappier start. If 75 R.P.M. were considered sufficient, a lighter and cheaper battery, giving about one-third less current, could be used.

The Model A Starter, weighing 62 lbs., delivers a maximum torque up to 600 inch-lbs.—i. e., 600 lbs. at the flywheel rim with a 2-inch pinion, or 400 lbs. with a 3-inch pinion. We recommend it for the biggest engines on wheels, and for large motor boat engines.

MARMON

Old School Honor Plus The Efficiency of Today

PLAIN, old-fashioned honor has been the foundation of many industrial successes. An honest effort to make the best possible goods to meet the requirements of the purchaser, a fair price placed upon these goods and square dealing with the buying public—these are among the things covered by that one word "honor."

Twelve years before the battle of Gettysburg, Nordyke & Marmon Company began the manufacture of machinery to meet highly exacting requirements. Since then more than forty manufacturing concerns have entered the same field, some with large production and low prices, others with special methods of obtaining business, and others with various propositions. Today the Nordyke & Marmon Company, with no variation of its policy, is among five survivors of this varied competition. During the sixty-two years, it has never marketed a product built for cheapness or with any other end in view than the best possible service to the purchaser.

Has this "old-school honor" paid? The answer lies here—in one of the leading manufacturing institutions of the great Middle West, a concern owned by the family that founded it, a company with sixty-two years of constant, healthy growth and unimpaired credit.

In the early days of the automobile industry Nordyke & Marmon Company began to build motor cars, the best that brains, experience, money and honest intent could produce. Always abreast and sometimes in advance of the marvelous development of this new device for the pleasure and convenience of mankind, the Marmon has become known the world over as among the very few cars classed in the first grade. It will continue among the best so long as this great manufacturing institution endures.

The great manufacturing plant of Nordyke & Marmon Company, equipped and organized at every point for up-to-the-minute efficiency, is open to your inspection. You cannot visit it without gaining from every department the indelible impress of years of sound, successful experience—without carrying away with you the greater confidence in the future and product of such an organization.

"The Easiest-Riding Car In The World"

MARMON

The Marmon "32" Five Passenger Touring Car

Price, $3,000. Four cylinder, 32-40 h.p., 120" wheel base, body types and equipment to meet every requirement. A rational, logical car for touring and city use. Years of satisfactory service have proved its economy in tires, fuel and upkeep—plus smooth, delightful operation and durability.

ANNOUNCEMENT

For the coming season the Marmon "Thirty Two" offers all the latest ideas in equipment, style and appointment.

The features of exclusive Marmon design, the scientifically selected materials and conscientious, expert workmanship, attain their highest development in this car.

The experience of sixty-two years as successful manufacturers of high grade machinery stands back of the refinement and mechanical perfection of the Marmon "Thirty Two."

A few of its many superior features:

Marmon "32" Motor—Proved the best by comparison with the finest products of European and American makers in the winning of the most arduous of long-distance races and road tours, and backed by years of consistent service in the hands of owners. 4 cylinder, 4½ inch bore, 5 inch stroke, 32-40 h.p., two spark, dual ignition system, large valves, abundant power combined with great flexibility and economy of fuel.

Lubrication—Marmon automatic force-feed, direct to bearing surfaces through hollow crank shaft. Widely copied but never equaled. Simple and reliable reducing oil consumption and wear to the minimum.

The Most Practical Three Point Motor Suspension. Straight Line Shaft Drive. Improved Cone Clutch.

Transmission—Unit with rear axle. Simple, strong, easy of access.

Internal Expanding Brakes—Two sets on each rear wheel, 403 square inches of braking surface. Clean cut design. Accessible and effective adjustment. Acknowledged by official investigation the most effective of braking systems.

Rear Axle—Marmon design and construction. Pressed steel housing, light, strong and durable. Accessible differential.

Left Hand Drive—with center control and every feature for safe and easy operation, making a car that a woman may drive with assurance—a car that may be trusted in any emergency.

Bodies—The individual design and finish of the Marmon "Thirty Two" bodies add a distinctive tone of beauty and refinement. Distinguished in appearance they indicate the high character of every detail of the car. They are made with every care, of finest materials, fitted with every appointment and extra deep hand-buffed upholstery. The running boards are clean, with metal boxes for batteries and tools set in front fenders.

Equipment—Electric starting and lighting system; tailor made top with dust boot and curtains; built-in windshield adjustable for ventilation; black and nickel finished; speedometer and clock combination; electric horn with button on steering wheel; electric light to illuminate entire dash; shock absorbers front and rear; single tire carrier rear and one extra demountable rim; coat rail; foot rest; full assortment of tools, and electric extension lamp. Box in rear and compartments in tonneau provide ample storage space for curtains, tubes, pump, jack and other articles.

Prices—Five-passenger Touring Car $3000; Four-passenger Suburban $3000; Two-passenger Roadster $2900; Speedway Type Speedster $2850; Limousine (seats seven) $4000; Landaulet (seats seven) $4100; prices f. o. b. factory, Indianapolis, Ind.

"The Easiest Riding Car In The World"

MARMON

The Marmon "48" Seven Passenger Touring Car

Price, $5,000. Six cylinder, 48-80 h.p., 145" wheel base with short turning ability eliminating the old objections to long wheel base. Body types and equipment to meet every requirement. The only big car with small car advantages. Wonderful riding qualities and surpassing power and flexibility. A car developed by years of exacting tests.

ANNOUNCEMENT

The more a man knows about motor cars—the more he will appreciate the Marmon "Forty Eight."

It is distinguished by its exclusive features as the most complete, luxurious and capable of all high-powered cars.

It has abundant power in proportion to weight. It combines small car ease of operation with the comfort and luxury of big car smoothness, flexibility and easy riding.

A few of the distinctive features of the Marmon "Forty Eight":

Marmon "48" Motor—The finest example of modern motor construction—silent and free from vibration at from three to sixty miles per hour on high gear—tremendously powerful—wonderfully flexible and responsive. Six cylinders, 4½ inch bore, 6 inch stroke, two-spark dual ignition system, large valves, enclosed, silent chain connection to electric starter.

Lubrication—A further development of the famous Marmon automatic force feed oiling system, used first in this country by the Marmon and proven successful by over ten years of service on Marmon cars. The oil is carried through hollow cam-shafts direct to the cam-shaft bearings as well as through the hollow crank shaft direct to the main bearings, connecting rod and piston-pin bearings.

Three Point Suspension. Straight Line Shaft Drive. Multiple Disc Dry Plate Clutch.

Transmission, Rear Axle and **Brakes**—of proportionate size and following the same general design developed on the Marmon "32" and proved by the most strenuous tests of racing on track and road and in the hands of owners.

Front Axle—One of the many exclusive features of this distinctive car. The vertical spindle is placed in the direct, center line of the wheel. It makes the safest, surest and easiest steering mechanism ever devised. It permits this 145 inch wheel-base car to be turned in a remarkably short radius—gives you all the pleasure and comfort of big car operation combined with the advantages of small car ease of control.

Simplicity and **Accessibility**—No other high powered car on the market offers such freedom from complication of mechanism—gives so many aids to sure, quick and simple adjustment of working parts.

Capability—In the design and manufacture of this car, the underlying idea was to meet every requirement of the discriminating buyer, who after long years of motoring experience has come to the exacting point of knowing and demanding the best. The Marmon "48" is alike the car supreme on the fashionable boulevard or on the most tortuous road or hill that long-distance touring provides. In all-round capability no car can equal its records of performances.

Bodies—The low-hung, graceful Marmon bodies mark a new note in design, distinctly in advance of anything heretofore presented to the public. In the beauty of line, in the comfort of even balance, well proportioned springs and deep upholstery and in luxury of appointment and finish, they leave nothing to be desired. The appearance is enhanced by clean running boards. Ample storage is provided for luggage and supplies.

Equipment—Electric starting and lighting system; extra quality tailor-made top with dust boot and curtains; new type windshield, designed as part of the dash with provision for abundant ventilation; speedometer and clock; electric light to illuminate entire dash; electric step light under tonneau doors; electric emergency lamp with long extension cord; electric horn, power tire pump, shock absorbers front and rear, tire carrier rear and extra demountable rim, coat rail, foot rest, full assortment of tools.

Prices—Seven, Five, Four and Two-passenger Body Types $5000; Limousine (seats seven) $6250; Berline Limousine (seats seven) $6450; Landaulet (seats seven) $6350; prices f. o. b. factory, Indianapolis, Ind.

New Lewis single-bearing full-floating type rear axle. For cars up to 4,000 lbs.

THIS axle presents the graceful lines, the rugged strength, and the refinement of detail that mean axle success for the car manufacturer and everybody concerned. It is "Lewis Quality" throughout. Note the following details:

Housing made from two stampings 3/16 sheet steel autogenously welded. Reinforced internally by tubes which carry the wheel bearing, extending through the main housing as close to the differential as is practical and supported at this point by elliptical plates embracing the wheel bearing tube and extending to the main housing walls to which they are welded.

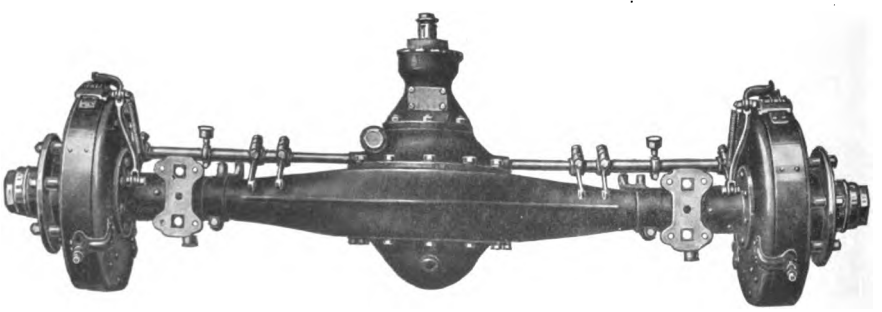
Adjustments can be made with ease—and the simple method by which axle can be dismounted insures quietness even when the work is done by unskilled labor.

Driving shaft is one-piece solid construction 1⅜" diameter made from 3½% hot rolled nickel steel heat treated. Will carry any load it is designed for.

Bearings: New Departure double roll ball with bronze ball separator. Differential bearings equipped with ½" balls; bearings with ⅝" balls. THIS AXLE IS ALSO DESIGNED TO ACCEPT ANNULAR BEARINGS.

LEWIS QUALITY

Brakes: Internal and external 16" diameter by 2¼" face. Facing impervious to oil, mud and water. Full floating, band type, toggle operated, very powerful.



Lubrication of this axle is exceptionally efficient. The oil and grease get to where they are needed—and stay away from where they are not needed! Think over this point and get details.

Gears: Main driving gear is 20-point carbon open hearth steel forging case-hardened and ground. Driving pinion is 3½% nickel steel case-hardened and heat treated—taper hole ground where fitted to pinion shaft. 1 5/16" face, 4 diametral pitch. Differential gears are 5-7 pitch and ⅞" face, bevel type with four pinions.

You will see at once that we have an axle of the very latest type with many exclusive features covering the very points you are most deeply interested in. Full details will be sent on request. Write.

"Automobile—
a motor vehicle"
From Webster's New Standard Dictionary

Trade-Marking a Famous Motor

Engrave on the tablets of your memory this trade-mark. It is the stamp of a good motor and a good motor is the solid foundation of a good automobile. The dictionary makers realized this, when they defined an Automobile as a "Motor Vehicle"; all men who motor acknowledge it; and more than 50 of America's leading motor vehicle makers proclaim it by building their cars upon the sure groundwork of the Continental Motor.

¶ A weak foundation has ruined many a costly edifice. Down to bed rock must go the substructure; down—in the case of a motor vehicle—to the hard and fast assurance of a motor with power, with speed, with certainty of service, with sales prestige, with long years of life-span.

¶ The name of the motor—symbol of power— reveals the character of the car. For the motor is the key to the whole construction—the costliest and most vital factor. Every motorist should know this, and Continental advertising is going to make this knowledge public property.

¶ Continental motors date back to 1903. They have perennial youth in design—the maturity of age in experience. Over 75,000 are now in use—developing, daily, more than six times the horsepower taken from Niagara. Best known cars —cars that have conquered the world's markets—have swept to success carrying the Continental Motor.

¶ To the companies making these cars, their engineers as well as our own, belongs the proud distinction of having made "Continental motors America's standard." For the counsel of these many engineers, some of whom not only stand as leaders in their profession but are individually known to every American who reads, has had much to do in the final perfecting of Continental motors.

¶ These are the far-seeing, level headed men who, building for the competition coming, have already specified over 40,000 Continental motors for 1914.

¶ Not made to meet a price, not built to shatter records of quantity, Continental motors are constructed to fulfill a service ideal—to be a true foundation for a worthy motor vehicle.

¶ For this we trade-mark our product.

Cole – "The Standardized Car"

Why did COLE buy the BIGGEST AD ever printed?

Why did he literally buy the **most expensive advertising** medium in the world by the yard?

Why did he spend $30,000 in one smash?

He did it for–YOU

COLE has always been the strongest champion of the automobile dealer in America. Cole has always contended that the foundation of the automobile industry is the dealer, and that in order to succeed any automobile factory must consider the dealer **first.** The only time the dealers of America ever got together in a convention with the idea of figuring out how to make more money was at the call of J. J. Cole. You have possibly heard J. J. Cole say—"The secret of success in this business is building a car on which the dealer can build his own business." You have said to your factory time and again—"I could make money if you would give me a car that wouldn't consume all my profit in service." The Cole's answer is—**"The Standardized Car"**—the car made from radiator to rear axle from the best stuff in the world, and by the greatest specialists in the world—the car that **leaves** your profits with you.

Why the Six-Page Ad in The Saturday Evening Post?

BECAUSE the Post is the world's one great, permanent automobile show. Because two million people visit this show every week—most of them successful people—a great mass of men and women who **buy** automobiles from **you.** This being so, and the Cole being game to the core, and having your interest at heart, the Cole bought more floor space at this show than any automobile maker ever bought. The Cole struck a heavier blow for you than any automobile maker ever struck—for behind this blow was the tremendous force of this great standardization idea, which is exclusive with Cole, and because Cole was fresh from one of the most successful automobile years an automobile maker ever enjoyed—the profits of which were shared in by Cole dealers everywhere.

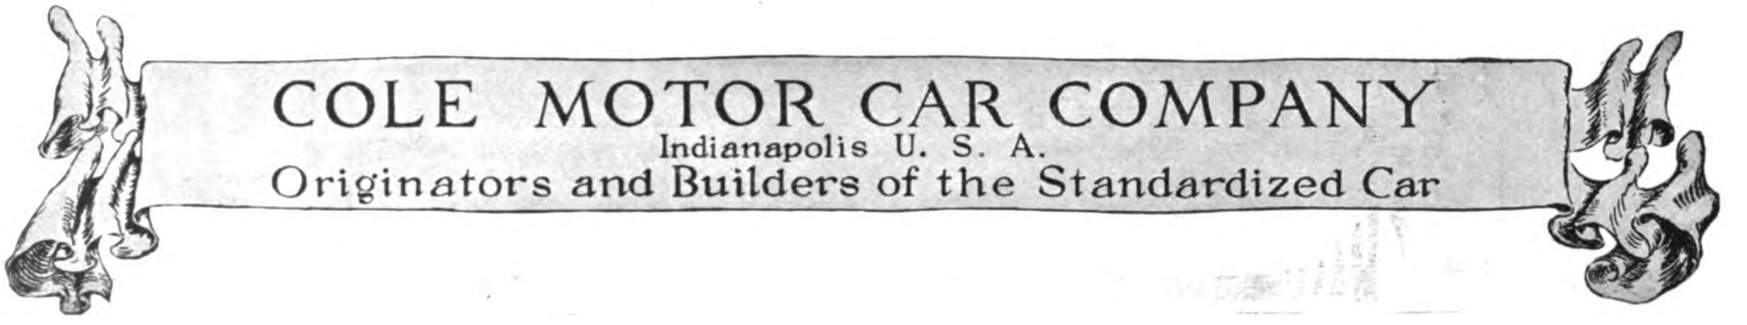
The Cole advertising campaign last season was recognized—even by competitors—as the best campaign of the year, and it did the business. It cleaned out the stuff. On July 1st there wasn't a car left on the Cole factory floor. That's the proof of advertising. Now, the same men who did the Cole advertising last year are doing it this year—they are Cole men 100 per cent—they live Cole—they know Cole—and when they tell the unmitigated truth about Cole, prospects are bound to fall because no man can resist the **truth.**

You are a dealer. You know what this means. You know it means that these Cole motor cars were **sold,** and that the men who sold them made money. Proof—fully 100 per cent of all Cole dealers applied for renewals for the coming season. The only thing in the world which makes it possible for us to talk business with you is the fact that we have doubled our output.

Cole Dealers Everywhere Are Making Money

ASK them—ask their bankers. **Now, how about you?** Only your private ledger can tell whether or not it is time for you to **hook up with Cole.** If you didn't make money last season it probably was not your fault. Who knows, maybe your factory was still doing business on the old lines—putting all the burden on the dealer—making you find your own prospects, leaving you alone to fight it out with your banker, making you work out for yourself the problems of its car, leaving you alone to sink or swim.

By Cole's methods—the prospect is brought to your salesroom with his checkbook in his hand. Will you take his check, or will you let that competitor of yours across the street see the light first and take that buyer's check from you, thereby making you **compete** instead of **share with** the livest automobile organization in the industry? Perhaps this coupon is the nugget which lies above the pay dirt. Dig—fill it out. Act **now.**



COLE MOTOR CAR COMPANY, Indianapolis, Ind.

Gentlemen:—Your way of making money for the automobile dealer looks good to me. I am certainly ready to talk to any organization which is game enough to spend $30,000 in one smash for the good of the dealer. When can I see you?

THE ATTERBURY LINE

Dealers gain a great advantage by handling a line of trucks which have years of practical experience behind them.

Years of practical experience in the sense we use it, does not mean a company's claim to have experimented from one to four or five years before putting a truck on the market. It means the experience of having built trucks and sold them—trucks that were designed and built in a factory and which went out into actual service and made good.

That is what is meant by years of practical experience behind the Atterbury line. In ten years of actual truck production, the Atterbury line has never had a weak member.

Each succeeding year has seen improved construction and truck refinements. Such betterments came as a result of contact with conditions, not the uncertain theory without chance for practical application.

The Atterbury Line—delivery cars and trucks from fifteen hundred pounds to five tons capacity—has a tremendous prestige and the weight of ten years of successful practice to work in your favor.

Write for particulars regarding our selling agreement and unassigned territory.

BAILEY
ELECTRIC SYSTEM

Refinement

No electric dynamo so far produced has the refinement which is characteristic of the Bailey.

The reason for this is, that Benjamin F. Bailey, the inventor, is an Electrical Engineer who not only has a good practical knowledge of electric lighting requirements, but the theoretical training and experience necessary to eliminate the trappy devices with which other generators are encumbered.

For instance, his mercury switch has displaced all troublesome methods of control, such as reverse current relays, magnetic switches, vibrating contacts, delicate rheostats, slipping clutches, corroding platinum points.

He has so designed the generator that the current output automatically increases the moment the headlights are turned on, to a point sufficient to meet the increased demand.

The machine is only 5 1-2 in. high, 5 1-2 in. wide and 7 1-2 in. long and weighs only 17 pounds.

It will develop almost twice the current that other generators of this size will.

Send for our booklet, "Electric Lighting," which explains it in detail.

Also describes the Bailey Combination Ignition Starting and Lighting unit.

PRICES :

Model L1, suitable for car lighting systems requiring 50 candle-power or less.....**$75.00**

This price includes generator, wiring, harness, 60-ampere hour storage battery and all controlling switches ready for installation.

Model L2, suitable for car lighting systems requiring 60 to 100 candle-power.....**$125.00**

This price includes generator, wiring, harness, 80-ampere hour storage battery and all controlling switches ready for installation.

"American" Axles

With the Famous Lanchester-Daimler Worm Drive

THE WORM DRIVE—for either gasoline or electric pleasure cars—reaches its highest form of efficiency when the Lanchester-Daimler type of gear is mounted in a full floating "American" Axle.

The superiority of this unit will be recognized instantly. It embraces the Worm Drive that has led the development of this gear abroad, and the highest class axle in America.

The combination carries with it the assurance that only the finest and best materials have been used—and assembled by highly expert workmen.

An "American" Axle containing the Lanchester-Daimler Worm Drive unites the best English and American shop practice. Fitted throughout with the finest class of foreign ball bearings, it is both silent and marvelously long lived.

We hold exclusive American rights as axle manufacturers to the Lanchester-Daimler Worm Gearing

Hartford Cone Clutches

REGARDLESS of whether a manufacturer's policy calls for quantity production or a limited number of cars, the quality maintained in the manufacture of Hartford Cone Clutches is economy for all concerned.

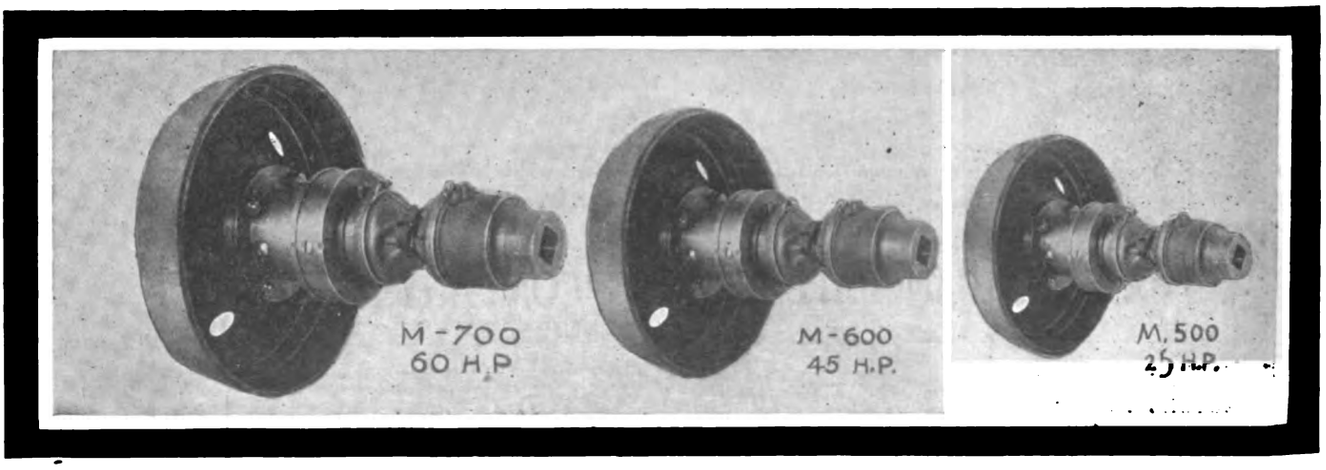
Two great features are essential to the successful performance of any clutch.

The First is "Efficiency to handle the work imposed upon it" regardless of the user's skill as a driver.

The Second is "The longevity of this sort of efficiency"—the life of clutch efficiency must equal the life of the car at least.

Any clutch which does not possess these two properties is bound to "back-fire" very seriously at both the car manufacturer and dealer. The back-fire from an incompetent clutch assembly is just as serious to those who make and sell high-priced cars in limited numbers as to those who make and sell lower priced cars in great numbers.

We have realized this always— that if our cone clutches caused a back-fire of public opinion, injuring the car's reputation, its manufacturer would suffer, its dealer would suffer and so would we as makers of the clutch.



How do we know that Hartford Cone Clutches have invariably given the best of satisfaction?

First—because they are correctly designed and manufactured with the utmost skill and nicety.

Second—because we never have lost a customer. On the contrary, each succeeding year has brought us new customers.

Just as the clutch is the intimate point of contact between a car and its driver, so is Hartford Quality the intimate point of contact between us and our customers.

"32" Six-Passenger	**$1200**
In Canada, $1450	
"20" H.P. Runabout	**$750**
In Canada, $850	

F. O. B. Detroit, *or Windsor*, fully equipped

The man who sells the Hupmobile enjoys advantages which are as helpful as they are unique.

He has a car that is practically without competition; and he has back of it and back of him, a most complete system of advertising and sales co-operation.

Perhaps our ideas of the dealer's relation to the factory differ from those that usually prevail at the factory; but we firmly believe, from our experience, that they work to the benefit of both dealer and manufacturer.

That is why we endeavor to fill the dealer with the spirit that imbues the entire factory organization.

That is why we want every Hupmobile dealer to feel that he is a member of the Hupmobile family—not merely a selling representative with the task of disposing of a number of cars alone and unaided.

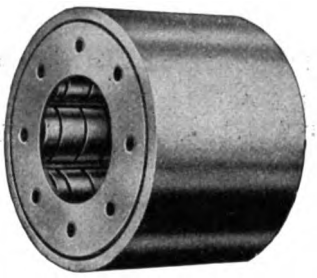
We want every Hupmobile dealer to have the benefit of our selling experience and our sales ideas and methods.

We spend thousands of dollars annually to advertise the Hupmobile in the most forceful way we know, to the greatest number of people.

We spend other thousands in sales suggestions to our dealers, for a house journal that the dealers prize highly for its merit, and in maintaining a field sales and service organization that is constantly in touch with Hupmobile dealers throughout the country.

That is our part of the work; and that it is performed and appreciated is evidenced by the co-operation we get from the dealers and in Hupmobile sales.

Team-work counts biggest and best in any business; and team-work is the keynote of the Hupmobile organization's efforts.



Hupp Motor Car Company, 1254 Milwaukee Ave., Detroit, Mich.

HYATT QUIET BEARINGS

LONG SERIES

The Short Series, High Duty Type, of the Hyatt Roller Bearing is furnished in shaft diameters from one to three inches inclusive, and in length from one inch upward. The Long Series is furnished in the same diameters and in lengths from two to three and one-half inches.

Special diameters and lengths to meet individual requirements, consistent with proper engineering practice will be furnished promptly.

Short Lengths are made possible in the High Duty Type through the use of nickel steel rollers, properly heat treated and ground, operating on solid inner and outer steel casings, also heat treated and ground. Heavy loads can thus be concentrated on short lengths.

TIMKEN
BEARINGS & AXLES

Literally, You Ride on the Bearings

THE actual size of the bearings is small; they are hidden away in the hubs of the wheels; good bearings need scarcely a thought. Yet they support the entire weight of the motor car—whether a light runabout or a heavily loaded truck.

Every roller in a Timken Bearing (average size for pleasure car) revolves 3.59 times during each revolution of the wheel, two thousand and thirteen times each mile of travel.

In 153,618 miles covered by N. W. Curson's car, in and out of Sacramento, each 4/10-inch roller has turned 309,229,008 times. Yet his Timken Bearings are still giving perfect service.

Curson's mileage record is extra long. Few would care to drive that far. Yet you do want to know that the bearings will stand up and give satisfactory service for the life-time of your car. Because cars today are being built for years of work.

Timken Tapered Roller Bearings have many records of long, severe service. In every part of the land motor car enthusiasts will tell you of the satisfaction they give.

Timken Bearings keep transmission, driving shaft, axle shafts, driving and differential gears, working with that smooth, "sweet," quiet uniformity that delights the "motor-wise" owner.

They withstand tremendous shocks, end-thrusts and stresses which would otherwise rack the entire vehicle as it bumps over a stone, drops into a rut, or swings rapidly 'round a corner.

Timken Tapered Roller Bearings do these things not only when they are new, but during the entire life of the car.

Get the whole interesting story of axles and bearings in greater detail by writing for the Timken Primers, T-3 "On the Care and Character of Bearings," and T-4 "On the Anatomy of Automobile Axles." Sent free, postpaid, from either address below.

Do you realize that the axles and their bearings are the most important parts of your motor car?

THE axles and bearings carry the load; are nearest the ground; are the first to meet every shock and stress.

On the front axle depends safe steering; it meets every emergency head on; it is the one part of the car where reliability is absolutely essential to your safety.

The rear axle is the one part of the car that performs more than a single function. It carries the load; it applies power to the wheels; it checks momentum with its brakes; its differential gears allow you to turn a corner safely.

Over 700 Separate Pieces in a Rear Axle!

TO be exact there are 723 pieces in a Timken-Detroit Rear Axle, and each piece, large or small, has an important duty to perform.

Timken experience, dating from the first motor car, proves that all of the 723 pieces are needed to make the most efficient axle.

They are made with such minute exactness that they fit together like the parts of a watch, forming a unit with the strength of a giant, the suppleness and elasticity of an athlete, the smooth, easy, quiet operation of a perfect mechanism.

It needs Timken-Detroit design, equipment, organization and experience to insure this result.

Starting at the Foundation.

TIMKEN starts at the foundation—an expert engineering staff that co-operates with the engineers of the motor car maker. Timken brings to the car builder's problem the specialized knowledge gained only by years of exclusive axle and bearing study and experience.

Regal

Your Problem—Our Solution

As a dealer you have many individual problems—created by local conditions. But primarily, this is the big issue with you:

The distributing of a car that will fit the needs and the pocketbooks of 90% of the car-purchasing public.

And here's a truthful, significant fact that commands your serious attention:

Up until June, the majority of automobile dealers in this country who actually sold their allotments, carried cars that sold for less than $1,200.

Among the successful ones, in many sections of the country, were dealers in

Regal Cars—Selling Around $1,000!

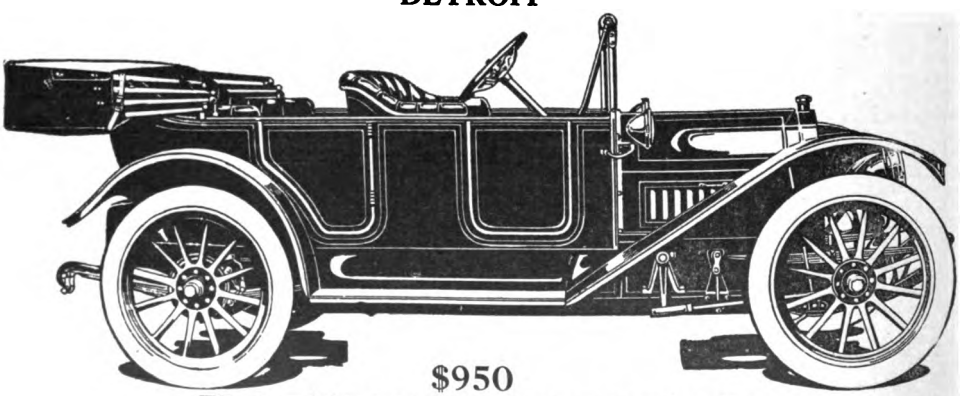
The solution to your problem is simple.

Become a Regal dealer. Regal cars challenge comparison in point of constructional superiority, efficiency, dependability and beauty.

Our Underslung Cars Are Favorites the World Over

The Regal Underslung cars insure a maximum of safety. They are *built to* and *do overcome* the dangers of skidding and "turning turtle." A Regal will cling safely to a 60° embankment.

You can prove that Regals conduce to gasoline and tire economy. The straight shaft drive transmits all power to the rear axle. The distinctive spring construction greatly reduces the wear on tires.



You can point to the low, sweeping, rakish lines of the Regal Underslung, and know that in point of beauty it is unchallenged.

Our line is broad and meets all demands. The Regal prices are all around the $1,000 figure. Our Underslung Touring Car and Roadster are favorites all over the world.

We have a good car, a good price and a good proposition for wide-awake, progressive dealers. Write us today, and we will explain our plans immediately. It will obligate you in no way. Get in touch with us at once.

BOSCH PLUGS

AS GOOD AS BOSCH MAGNETOS

IN the 500-Mile Sweepstakes 80 per cent. of the ten prize winners used Bosch Magnetos, 70 per cent. used Bosch Spark Plugs. The showing made by Bosch Magnetos, Bosch Plugs, Bosch Cable, etc., in this race, as in their many preceding trials of national and international fame—was not an accident, not a mere chance performance, as could be recognized by the practically exclusive use of Bosch Products—but is proof conclusive of Supreme Quality.

To the Dealer in Motor Accessories This Means Much

It means the vivid and conclusive demonstration of Bosch Quality.

It means the maintenance of Bosch Supremacy.

It means even a greater spread of Bosch Fame.

It means big demand and ready sales of Bosch Spark Plugs.

In addition, Bosch Plugs are backed by an advertising campaign of national scope—a campaign broader, more persistent and more far reaching than that for any other spark plug.

To the dealer this means quick moving stock—and a high cash value for all stock on hand.

There is a fair margin of profit in the sale of Bosch Plugs, a margin that will repay any dealer for their handling.

There are New Quantity Prices on Bosch Plugs

Successful Sale of Used Cars

It is trite to say that the manufacture of automobiles has developed from a game to a business. Evidonce of this fact is patent on every hand. Continuous refinement of car details will still further disclose it.

One of tho most important foatures of the business and one of the greatost arguments which a manufacturer can offor for the oxcellonco of his product is tho successful salo of his used cars.

And one of the points on which such successful sales are largely governed is the PERMANENT SECURITY OF THE BOLTED-UP CONSTRUCTION.

To guarantee such security the SPRING LOCK WASHERS must be first, of proper size, i. e., of such section as to have sufficient holding strength; second, a steel of such analysis as will take proper heat treatment; third, a heat treatment of a nature calculatod to insure uniform excellence.

Are you protected on all three points?

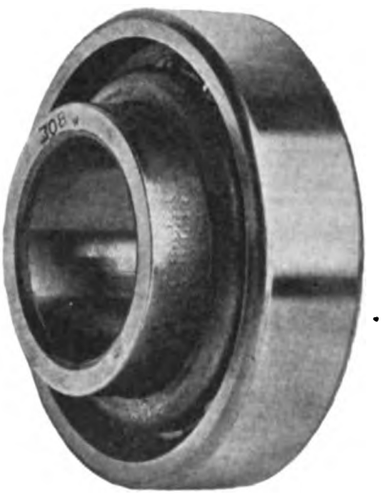
CAPACITY

GURNEY

ENDURANCE

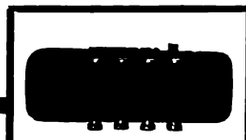


THIS BEARING, THE GURNEY RADIO-THRUST BEARING, is especially applicable in a number of places in a Motor Car. And in these places it has distinct advantage over any other bearing made.

¶ **In Front Wheels**—In addition to the simplicity, low friction, and general desirability of the annular ball bearing it has the one thing more desired, abundant capacity to take thrust.

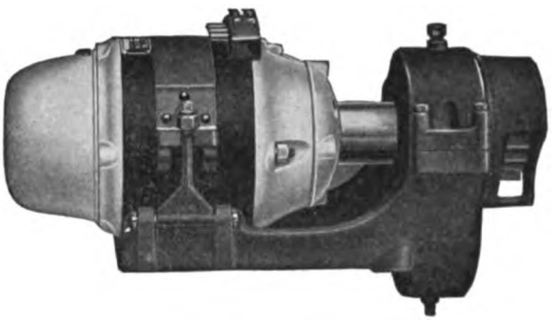
¶ **On Rear Axles and in Rear Wheels**—In any of the various types in use, it has precisely the same advantages as in the Front Wheels, all the good features of the best annular ball bearing plus Thrust Capacity for any possible exigency.

¶ **Next to the Differential**—A single bearing serves with equal efficiency and success where ordinarily two bearings are used, a radial and a thrust bearing.



¶ **Back of the Bevel Pinion**—As next to the Differential you get in One Bearing all the service of two bearings, and at the Price of One.

¶ The Gurney R-T Bearing is the Ball Bearing plus. It gives you all the bearing value you have heretofore gotten, plus certain very desirable features you have always wanted. It gives you Gurney CAPACITY and ENDURANCE, plus Gurney SIMPLICITY and ECONOMY.



Gurney Ball Bearing Company

Jamestown, N. Y.

The North East Lock Switch Positively locks the different circuits on or off as desired.

The North East Motor Generator—Note its compactness.

The North East Starting Switch Free from complicated contactors and contact troubles.

THE NOISELESS NORTH EAST

Electric Starting

AND

Lighting System

Positively the Lightest, Most Compact, Most Flexible, Most Powerful and Most Economical—the perfected result of over four years' experience in building electric starting and lighting systems in the finest and best equipped factory in the world devoted exclusively to the purpose.

HAS BEEN RUN 60,000 MILES WITHOUT ANY PRECEPTIBLE WEAR ON EITHER BRUSHES OR BEARINGS

Proving itself best by actual test, its simplicity has never yet been approached. The motor generator is constructed on the unit system with only one moving part — the armature — which automatically changes from motor to generator when the engine starts. It thus combines in a single machine the functions of two separate and distinct machines for starting and lighting. Its compactness requires only a comparatively small amount of space, which allows its installation on any engine in the most advantageous position.

The North East System does its work smoothly and noiselessly, and revolves the motor at exactly the critical speed to start the engine under any condition without pulling the voltage of the battery down to a point of exhaustion. Gives the same service on hilly tours as on the streets of the city.

Manufacturers who are serving the best interests of their car owners have realized the economy and efficiency of the North East Starting and Lighting System by adopting it, and investigation will prove it is the only system you'll want on your new car.

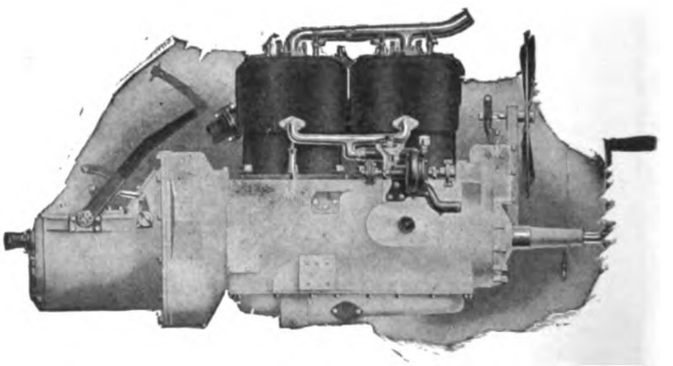
STANDARD SIZES

Model D, . . 3¾ x 4½
Model CX, . . 4 x 4½
Model D, . . 4⅜ x 6

A feature of Ergon design is the method of valve arrangement. Valve stems and push rods run in removable guides. Valves are extra large and the entire assembly is enclosed in an oil and dust proof compartment. They are, however, easily accessible by removing a door on each pair of cylinders.



A large cooling water jacket is provided, the water intake at the bottom of the firing chamber and outlet near the top.

Both intake and exhaust manifolds are located on valve side of this motor, not so close together as to produce unusual heating but so as to aid carburetion. Magneto and water pump are located on opposite side.

Ergon cylinders are cast in pairs from special analysis non-shrinkable iron. The cylinders are bored twice and finished by grinding to a limit of .001 before being run in on the block.

In line with the general tendency toward starting devices, the Model D Motor Crank Case is deep enough so any standard make starter, electric or pneumatic, may be accommodated without disturbing motor accessibility. Timing gears have been replaced by Renold Silent Chain Drive.

We are prepared to make prompt shipment of any of the Ergon standard motors, either unit plant type or as independent motors.

Ergon Models C and CX in unit plant type are regularly equipped with multiple disc clutch in oil and selective type transmission. Model D in unit plant type has Brown-Lipe dry plate clutch.

SPRINGFIELD CONVERTIBLE BODIES

Dealers who anticipate the wants of hypercritical car buyers will be quick to see the advisability of specifying Springfield Convertible Bodies, for it stands that they make good cars still better and the quality argument they offer is too big to be discounted.

As specifications they offer a strong selling argument for both the manufacturer and dealer.

Beauty, convenience and sterling worth of these bodies is apparent to all who have seen them and studied their construction.

We show here an illustration which is a faithful picture of one of our products—made in a factory equipped to turn out bodies and tops of every style and size, from the smallest runabout to the most pretentious limousine or landaulet.

Send for complete details of construction.

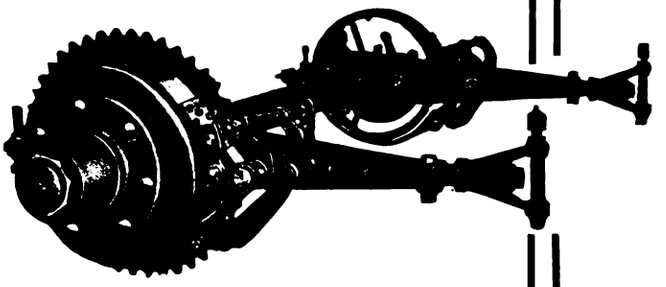
SHELDON BRAKES Are the Real Thing!

For Motor Trucks

They are double acting, of course—both service and emergency sets. But, unlike many double-acting brakes, they do **not** sacrifice the highly desirable **"wind up"** principle of action in order to work equally well in both directions.

Sheldon brakes "wind up"; but neither end of the band is rigidly anchored. When going ahead one end is anchored and the other is tightened. When going backward the **other** end anchors and the first end is tightened.

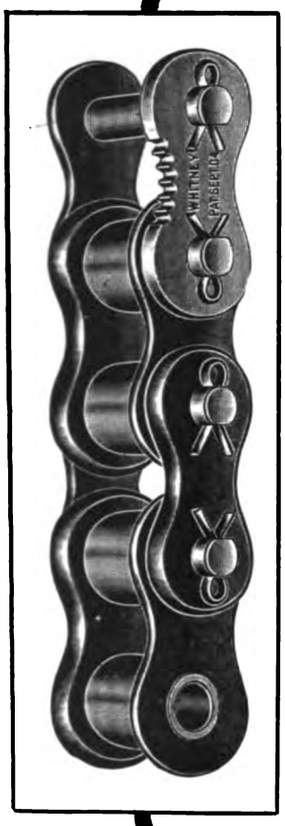


In the drawing A is the going-ahead anchor link, ending in a closed slot in which floats the pin B, attached to the outer brake band. The lever C, fulcrumed on B, and the adjustable tension link D tighten the brake. When going ahead the whole band moves till the pin B comes to the end of the slot as shown.

The cross pin E, in the end of the second anchor link F, engages the slot in piece G, riveted to the brake band. When the wheel is turning backward the band when tightened rotates till G stops against E thus anchoring the upper end of the band. This movement carries B to a free position in its slot in A, and causes the brake to wind up in the reverse direction.

The inside band simply floats in its drum. When the ends are spread by the toggle H I J, either end stops against the pin K, and the other spreads until the band grips all around its surface.

Incidentally, both sets of brakes act on the rear wheels—as they ought to! That is an accident policy worth having.



Let us tell you more about Sheldon axle, brake, and steel wheel equipment

"WHITNEY" Chains

WE call your attention here to "Whitney" Cotter Detachable Chains as the most practical chains ever offered for motor vehicles. They have made a record for themselves which no other Detachable Type has approached.

This Cotter Pin feature is so practical and necessary that it calls for little detailed explanation. The illustrations tell their own story, proving that this form of construction is logical and necessary for chain equipped motor vehicles. This Cotter Detachable Chain can be taken apart at any link and lengthened, shortened or repaired without the use of any special tool, as the Cotter Pin can be removed with pliers, screw driver or any sharp pointed instrument. The use of "Whitney" Cotter Detachable Chains assures the builder, owner and driver of commercial vehicles uninterrupted service on account of the ease of repair.

"Whitney" Chains are made from steel best adapted for the purpose, carefully hardened and calculated to resist the most wear, while in the matters of machining and assembling the utmost care is exercised and thorough inspections and tests characterize each process of manufacture. Their future service, however, depends upon the accuracy of sprockets, care, lubrication, alignment and adjustment, for the best chain in existence cannot withstand the evil influence of improper conditions and give best results.

Write for our illustrated catalog which shows top and side views of each size of all Roller chains manufactured by us.

HARTFORD, CONN.

SPLITDORF

"Always There"

Neglect breeds mischief

and every day you neglect insisting upon the use of SPLITDORF COMMON SENSE PLUGS you are opening the way for mischief in your ignition system and your motor.

We make no mistake in claiming absolute superiority for SPLITDORF PLUGS for they are soot-proof, gas-proof and unbreakable and we GUARANTEE OUR CLAIMS.

The insulation of SPLITDORF PLUGS is high quality mica and designed and manufactured to absolutely withstand the breaking down effects of high tension current.

The design of the SPLITDORF central electrode is proof against all expansion and contraction.

The construction of the SPLITDORF shell allows small space for gas and its shape prevents all trouble due to pre-ignition on account of red-hot metal parts.

The SPLITDORF PLUG is less liable to short-circuit from carbon deposits than any other form of plug ever put out by any manufacturer.

Neglect no longer—insist upon SPLITDORF PLUGS with the hexagonal porcelains, and eliminate all chance of future mischief.

Remember, All! "New ignition for old" is our slogan--We have a SPECIAL EXCHANGE proposition of the greatest interest to every owner of a gasoline motor who would save time and money. Write or call TODAY for particulars.

Your Customers Want Soot-Proof Spark Plugs

There is a greater and steadier demand for Soot-Proof Plugs than for any other.

They have been on the market longer and motorists have come to rely upon them when others failed to live up to their advertised qualities.

Soot-Proof Plugs are warranted not to short-circuit or leak. They are built with a double chamber and have three times the resistance of the ordinary plug—hence the hottest spark a current is capable of.

Soot-Proof Plugs are self-cleaning and prevent all ignition troubles such as balks, weak spark, carbon, etc., in so far as plugs are concerned.

Why not sell the best known and most reliable spark plug. Going with popular demand is better than bucking against it.

THE FEDERATION OF TRADE PRESS ASSOCIATIONS OF THE UNITED STATES

Business Promotion Through Trade Press Efficiency

is to be the keynote of the most notable gathering of technical, class and trade journal editors and publishers ever held in America. No live manufacturer, sales manager, advertising man, trade paper editor or publisher can afford to overlook the

Eight Annual Convention of the Federation of Trade Press Associations in the United States at the Hotel Astor, New York, Sept. 18, 19, 20, 1913

Two sessions will be held daily. There will be editorial, circulation, advertising and publishing symposiums under competent leaders. Many of the leading editors, business managers, buyers and sellers of advertising, and authorities on modern merchandising methods will take part. On Friday afternoon, September 19, there will be a mass meeting with addresses by representative business and professional men, on subjects of timely interest to editors, publishers and advertisers. Distinguished guests and worth-while speakers will be at the annual banquet, which will be made a memorable social occasion. No matter what may be your connection with the trade journal field, if you are interested in the idea of business promotion through trade press efficiency, if you believe in business papers for business men, you will be welcome at all sessions.

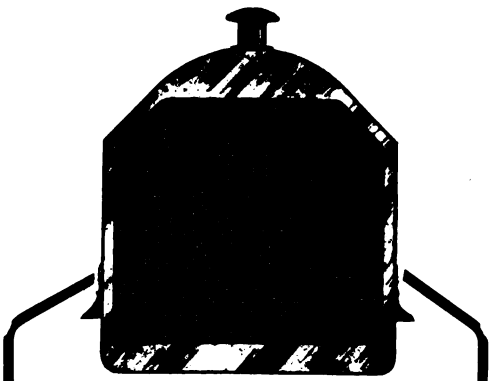
Automobile Owners and Tourists

Should break their journey and avail themselves of the excellent facilities offered by the D. & C. Lake Lines, operating daily service between Detroit and Buffalo and Detroit and Cleveland.



Enjoy the delights of the cool breezes from Lake Erie and resume your journey in the morning after a refreshing night's rest. Special attention given by this company to the handling of automobiles. Rates quoted on application (state wheelbase); tanks of automobiles must be emptied of gasoline before being shipped. Supply is furnished free by dock attendants before leaving dock.

Roads in this section of the country are in first class condition; new road between Detroit and Toledo; tourists speak highly of the road between Buffalo and New York.

On your trip this summer, bear in mind "The Water Way is the Comfortable Way."

Send two-cent stamp for illustrated pamphlet and Great Lakes map. Address L. G. Lewis, Gen'l Pass. Agent, Detroit, Mich.

For Tire Trouble

Much of which results from the friction between tube and shoe, you want a lubricant that will cure the trouble, not aggravate it.

Dixon's Motor Graphite

Introduced between tube and shoe does not injure the rubber (as does soap stone), materially reduces the heating due to friction, and lengthens the life of the tire. Blow-outs are practically unknown where Dixon's Motor Graphite is used. This—with other automobile economies—is explained in "Lubricating the Motor," No. 23—a book every autoist should have.

Sanford

MOTOR TRUCKS

They are distinctly representative of modern standardization of merit, as well as the standardization of their different parts. They are the most conveniently accessible trucks on the American market.

Their efficiency has made them popular; their builders make them lastingly good.

They are known for their reliability, dependable delivery schedules, low gasoline consumption, large loading space, and easy maneuvering in crowded traffic conditions.

They do not have long rear overhang. This means low tire expense.

Wrapped Tread Blow-out Repairs Outwear the Tire

REPAIR tires by the approved method that tire makers have adopted for MAKING them. Instead of cutting away a lot of fabric and rubber from the OUTSIDE of the tire, reinforce it from the INSIDE with a few layers of canvas, seal the hole through the tire with a plug of raw rubber, and apply heat to the inside and outside at the same time. Thus you can make a repair that is actually stronger than the rest of the tire—one that can't give way.

This method is economical, requiring only about half as much material as any other system. It is simple—anyone can do the work perfectly. Only one set of forms is required for handling all sizes of tires. By curing from both sides of the tire at once the time of curing is decreased 50 per cent. and all tendency toward overcuring the tire is eliminated.

SHALER

Steam and Electric

VULCANIZERS

Wrapped tread repairing can be done best only with Shaler Vulcanizers because they have the exclusive feature of a temperature control that is automatic. This insures the maintenance of a uniform temperature from beginning to end of the cure and does away with constant watching by the operator. He can devote ALL of his time to preparing repairs while the vulcanizer is at work.

Write today for details of this moneymaking process

We have published a book of especial interest to garage men. In addition to other valuable information it contains description of Shaler tire repair outfits. Write for free copy of "Common Sense About Tire Repairs."

Why the Church-Field Electric has been Klaxonized

"IT has been customary for manufacturers of electric carriages, for a number of years, to use electric bells as warning signals.

"In view of the fact that the Church-Field Electric is designed and manufactured along automobile lines, in distinction from carriage lines, and is in all respects an electric automobile, this company has from the beginning used Klaxonet horns as its standard equipment for warning signals.

"The Klaxonet was selected because of its high standard and fine tone, and the economy of current consumption. There is an advertising value to the Church-Field Electric by reason of the use of Klaxonet Horns."

—Excerpt from a letter from the Church-Field Motor Company to the Makers of the Klaxon.

The inadequate bell is as out-of-date for electrics as is the bulb horn for gasolene cars. 6 of the former, 51 of the latter, are now Klaxon-equipped. This list includes, with but one or two exceptions, every high-grade car on the market.

Studebaker "35"
$1290

THE demand for Studebaker Cars is universal. But the explanation is simple.

In the first place no bigger values can be found.

In the second place the public has confidence in Studebaker integrity.

—And that is why Studebaker dealers enjoy the popular favor that comes from handling a standard line of known value.

Contracts to sell Studebaker cars are eagerly sought and always will be sought—so long as the public endorses Studebaker cars, Studebaker service and Studebaker integrity.

Ten cents a copy
Two dollars a year

"COMPLICATED STARTERS WON'T DO"

That's what automobile **owners** and automobile **dealers** are saying.

They agree that the Electric Starter has come to stay, but all will be careful to avoid **complicated** starters that puzzle the brain of any garage man that attempts an overhauling.

Thus comes the **increased** popularity of the **Electric** Disco, which is **NOT** a complicated starter.

Motor car makers are paying more for this starter than for any other, **to avoid mechanical complication. They want their cars to be trouble-proof** as well as efficient.

You, Mr. Motorist, should heed these facts. Then you'll get the benefit of a **simplified** electric starter.

Spinning or Cranking?

In comparing Electric Starters, the experienced motorist also notes the **speed** at which the motor revolves.

The difference is very noticeable.

The average electric starter gives a speed of 40 to 50 revolutions per minute. It cranks, but does not **spin** the motor.

The **Electric Disco,** at the touch of the button, spins the engine 150 revolutions per minute.

Think what this additional speed means on a cold day when the engine is dead and the oil stiff.

It means not only a **sure** start but an **instantaneous** start.

Leading 1914 Cars Carry Disco Equipment

More automobile manufacturers are being added right along to the list of Disco users. And the greatest engineers in the country concede that the **Electric Disco** is built of the best materials and in the most expert manner. That's because we are not jobbers. We make our own parts, thus attaining a precision otherwise impossible.

Before You Buy

your car, look into this starter subject carefully. Sooner or later you must know starters. And the time to know is **before,** not **after** your car is delivered. **FOR YOU CAN'T CHANGE STARTERS. THE STARTER is built into** the car.

Send for the Electric Disco Book. We have equipped over 150,000 cars. Surely our experience should be worth something to you. A postal sent today brings answer by return mail.

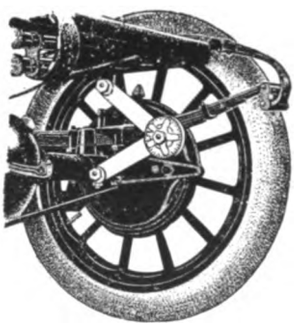
Truffault-Hartford Shock Absorbers Help Sell Stevens-Duryea Cars



Progress in automobile manufacture dates back to the creation of the first power-driven wagon by Mr. Frank Duryea and is traced up through its several stages to the splendid six-cylinder Stevens-Duryea car of today.

The Stevens-Duryea occupies a unique position in the automobile world not only as the pioneer car, but as one to advance many new and revolutionary departures in construction—later to be universally adopted by leading car concerns.

One of the factors to which may be attributed the fast-increasing demand for the Stevens-Duryea car is the exceptional provision its builders have made for the comfort and easy-riding of its passengers.

With deep upholstery, newly designed springs and finally Truffault-Hartford Shock Absorbers, this car rides with remarkable smoothness.

Truffault-Hartford Shock Absorbers virtually complete its comfort equipment—bringing out the best in each of the other factors.

Send for New Complete Catalog

Comfort has become a vital consideration to which car buyers are no longer indifferent. The provision made by car concerns in the equipment of their cars is one feature that never escapes the car buyer today.

In his estimation there is an emphatic need for Truffault-Hartford Shock Absorbers—due not alone to his knowledge of the adoption of this device as regular equipment by 25 leading car builders, but in nine cases out of ten to his actual and satisfactory experience with Truffault-Hartfords on cars he formerly owned. The

Truffault-Hartford
SHOCK ABSORBER
"The Pioneer Shock Absorber"

is of highly material assistance in selling any car. Manufacturers have this assurance and the extra assurance that their car's appearance will not suffer by attachment. There is an expressed preference for Truffault-Hartfords among women motorists—and as occupants of the rear seat and tonneau *they ought to know.*

For progressives only

AS a rule, an automobile dealer's success or failure is equivalent to the success or failure of the factory he is doing business with.

The success of the Willys-Overland Company has been due, largely, to its foresight and ability to correctly judge and weigh the average public demand. Definite knowledge of this has made it possible for us to always keep it over-supplied. That is, knowing public opinion and operating along the lines of least resistance, we have continually given the public considerably more than they expected.

The result is that today we are recognized as the leading and most influential factor in the industry.

Every Overland dealer shares in the prestige and profits that naturally come from such industrial distinction. Thousands of dealers have prospered with us. Thousands of Overland dealers are recognized by their local banks as among the soundest business institutions in their community. Thousands of Overland dealers have constructed a profitable business which would have been impossible without such a sought-after car and comprehensive organization as ours back of them.

Think this over. We are continually on the lookout for new and better dealers. Possibly we can get together to our mutual advantage.

Our 1914 line will be the strongest in the history of our company. And 1914 would be a splendid time for you to start.

We announce August 16th. Wait for this and then get into communication with us.

BRITISH COMMER TO HANDLE ITS AMERICAN INTERESTS

Lapse of Old Contracts Enables Truck Maker to Establish Direct Branch —"Lets Out" Three-Million-Dollar Company.

Despite the fact that the Commer Truck Co. of America was incorporated in March last under the laws of Delaware with a capitalization of $3,000,000 and was generally supposed to be about to continue the Commer business in America, which was interrupted by the failure of Wyckoff, Church & Partridge, of New York City, affairs have taken a different turn. Existing contracts having expired, the Commercial Cars, Ltd., of Luton, Eng., which makes the famous truck, is to establish a direct branch of the parent company for the transaction of its American business, and A. C. Platt, who was connected with Wyckoff, Church & Partridge, will be its manager.

As soon as is possible, the branch will open up in New York City and the marketing of the trucks will be actively resumed. Platt states that he has 18 or 20 trucks practically available for his purpose and is seeking an advantageous location. Later, arrangements for manufacturing in America may be made.

When the Wyckoff company became financially involved there was speculation in the trade as to what would become of the Commer contract, and when the Delaware corporation was formed it was supposed that its future was based on this agreement, but inquiry of those who were directing affairs always failed to reveal anything definite in the way of information.

If such were the plans of the $3,000,000 Commer Truck Co. of America, however, they were dissipated June 30 last, when the contract expired, for it was not renewed; instead, Platt, who had hied himself to England, convinced the Commer company that the best way to handle its American trade with success and prestige for its name in "the States" was through a direct representation, and this arrangement resulted. Branches or dealerships in other cities and an extended selling campaign are included in the branch plans.

Warren Assets to be Resold Monday.

After having been once offered for public sale, and then ordered restored to the receiver, the assets of the Warren Motor Car Co., of Detroit, will be again put on the block on Monday next, 4th proximo. The assets include real estate, buildings, equipment and material on hand. When it was first offered for sale, June 26th, it was bid in by W. C. Rands, of the Rands Mfg. Co., of Detroit, but a legal knot developed and, as Motor World exclusively stated, the sale was not confirmed by the court.

Maxwell Cuts Deep Into Its "Six."

Instead of increasing its prices, as was stated in a paid-for announcement of its New York agents four weeks ago, the Maxwell Motor Co. will reduce the price of at least two of its models. The Maxwell "six" will be reduced from $2,350 to $1,975 and the Maxwell "35" from $1,085 to $1,075 without electric starter and $1,225 so equipped. The price of the Maxwell "25" will be maintained at $750.

McMullen Secures McCue Sales Account.

The increasing pressure of manufacturing demands finally has induced the McCue Co., of Buffalo, to turn over to Roger B. McMullen the entire distribution of its wire wheels and axles. McMullen, who maintains offices in Chicago and Detroit, long has been widely and favorably known to the entire trade.

Willys-Overland Declares Extra Dividend.

The Willys-Overland Co. has declared an extra dividend of five per cent. on its common stock, payable August 10th. This, of course, is in addition to the regular quarterly dividend of 1½ per cent., which is payable August 1st.

RECEIVER FOR R.C.H. FOLLOWS THE CREDITORS' COMMITTEE

"Friendly Proceeding to Assist Reorganization," the Official Explanation — Train of Embarrassment Caused by Excess of Orders.

After having been in the hands of a creditors' committee since November last, the R. C. H. Corporation, of Detroit, was placed in the hands of the Security Trust Co., as receiver, late last week. According to the formal announcement of the company itself, "the receivership is one of the steps in the reorganization plan, the application being a friendly one and made with the endorsement of the entire board of directors and the majority of the creditors."

The receivership follows a succession of rumors that such a move was in contemplation and, therefore, will excite small comment in the trade. In November last, when the creditors took charge and were elected directors, it was stated that the R. C. H. assets exceeded the liabilities by $576,000. Later, in January, the creditors displaced R. C. Hupp as president, and installed J. F. Hartz, president of the C. M. Hall Lamp Co., of Detroit, who in November had been elected treasurer of the R. C. H. establishment. At the same time, Peyton R. Janney was appointed general manager, R. C. Hupp becoming vice-president.

Hupp then practically retired from active participation in the affairs of the company, but it was not until several months later that he formally severed his connection with it and became president of the Monarch Motor Car Co., which, meanwhile, had been organized by his brother-in-law.

When the changes were brought about, in January, it was stated that the R. C. H. Corporation had executed a mortgage on its property which rendered available the sum of $300,000.

During its comparatively short life the company had built up a considerable agency

Digitized by Google

system and had also established some very desirable foreign connections, but, like many another concern identified with the automobile industry, it accumulated more orders than its resources would permit to be handled. President Hartz, it is officially stated, will cooperate with the receiver in continuing the business.

Chicago Dealer Suddenly Disappears.

Grover E. Olds, the 24-year-old manager of the Herreshoff Chicago Motor Car Co., dropped out of sight late last week and his present whereabouts are unknown. He was started in business by his father, a retired capitalist, and the business is said to have been profitable, but young Olds is reported to have flown so high in several directions that apparently he deemed disappearance the better part of valor. The Chicago agency, it is understood, will be taken over by the parent Herreshoff company, of Detroit, J. F. Hebbard, its representative, now being in the Windy City for that purpose.

Rajah-Grossman Litigation Terminated.

The second suit of the Rajah Auto Supply Co., of Bloomfield, N. J., against the Emil Grossman Co., of New York City, over the Rajah removable porcelain spark plug patent, No. 825,856, was ended last week when the complaint was dismissed without costs in the United States District Court for the Southern District of New York; the suit was more or less a continuation of an attempt to have the Grossman company held in contempt of court for selling porcelains after it had been enjoined from manufacturing infringing plugs. The contempt proceedings were unsuccessful, as was the following suit.

Raleigh Dealer Demands Jackson Deposit.

Claiming $1,580 as an unrefunded deposit following a breach of contract, the Raleigh Motor Car & Machine Co., of Raleigh, N. C., has filed suit in the Supreme Court for New York county against the Jackson Motor Co., of Jackson, Mich. The Raleigh company signed up as a dealer in 1910 and deposited $2,000, it claims, and had received a refund of but $420 when the Jackson company broke the contract by failing to ship cars as scheduled and by failing to have what it did ship of proper quality, according to the allegations. The Jackson company has entered a general denial.

Castle Lamp to Remove to Toledo.

The Castle Lamp Co., which about a year ago was removed from Amesbury, Mass., to Battle Creek, Mich., is to be removed to Toledo, Ohio. It is one of John N. Willys's properties and the decision to locate it in Toledo is, therefore, not wholly surprising.

INTERNAL CLASH BRINGS WOE TO THE MUNCIE GEAR WORKS

With $400,000 Orders in Hand, Receiver Appointed in Order to Conserve the Assets—Working Capital Impaired.

On allegations that disagreements in the board of directors imperil the creditors' interests and that its liabilities have increased since June 1st and that its assets have diminished, the Muncie Gear Works, of Muncie, Ind., was thrown into the hands of a receiver late last week on the application of E. C. Atkins, of Indianapolis, Eugene Vatet, of Muncie, being named by the court to act as receiver. Among other things, it is also charged that certain assets have been removed from the State.

The Atkins complaint states that on June 1st the Gear company's liabilities amounted to $277,061 and its assets to $204,752, but, despite the alleged increase in one and decrease in the other, it is admitted that the company has in hand orders sufficient to earn a profit of $100,000, which sum is the estimated difference between the assets and the liabilities. These orders are said to amount to $400,000.

Thomas W. Warner, of Toledo, who is president of the company, is reported to have recently loaned it $25,000 as working capital and is credited with stating that since that time it has made net profits amounting to [illegible]

Hugh [illegible]arner, of Muncie, and D. C. S[illegible], a glass manufacturer, are among the largest stockholders.

It is understood that but for differences between the directors the financial stringency might have been bridged. As it is, the factory will be operated by the receiver without interruption.

Because the two Warners were once identified with the Warner Gear Co., of Muncie, the latter concern reports that it is being confused with the embarrassed company when in fact they have nothing to do with it; they long since disposed of their holdings, no one of the name Warner now being in the Warner Gear Co.

Willys Secures Service Station Site.

While most other automobile manufacturers have sought Long Island City as a location for their metropolitan service stations, the Willys-Overland Co. has made a move in an opposite direction, and in seeking a site for an additional service station for Garford trucks has invaded The Bronx; a 21-year-lease has been secured on a plot of land on 150th street, between River and Gerard avenues, and on which the owner, Henry Lewis Morris, will erect a two-story building, 200 x 148 feet. The aggregate net rental is about $275,000.

This station will supplement the one now operated on West End avenue, on New York's upper West Side, by the R & L Co., the Garford dealer in New York, both being operated to care for their respective territories. Another move which concerns the Willys interests is to be made, probably September 1, when the C. T. Silver Motor Co., Overland dealer in the metropolitan district and now located at 1599 Broadway, will move its salesrooms to the place formerly occupied by the accessory department of Wyckoff, Church & Pratridge, at Broadway and West 56th street. Other quarters will be sought for the Silver service station which is now located at the rear of the salesrooms, and which has long since outgrown its location.

Motor Financiers "Go Into" Cars.

Kenton Harman, head of the Harman-Yount Co., which is conducting an automobile financing business, is the prime mover in the Michigan Motor Car Co. of New York, which was incorporated last week and which will handle the Michigan car in New York City. Harman is president of the company, James A. Murphy vice-president and treasurer and C. Anthony Wolfe secretary. Murphy and Wolfe are also interested in the Harman-Yount Co. The Michigan company will locatae its sales room on Broadway, and already has established its service station at 155 West 56th street.

Kellogg Organizes European Company.

The Kellogg Mfg. Co., of Rochester, N. Y., which for some time has maintained an establishment in London, has incorporated its business on the "other side" under the style Kellogg Mfg. Co. (Europe), Ltd., with a capital of $10,000 in $5 shares. In addition to acquiring the Kellogg business at 265 Strand, London, W. C., the objects of the incorporation are stated to be "to adopt an agreement with A. H. Hedinger," who figures as managing director of the new company. Kellogg pumps are almost as well known in Great Britain as they are in this country.

Knox Not to be Sold at Auction.

According to a tentative agreement between the chief creditors of the Knox Automobile Co. of Springfield, Mass., and Charles W. Bosworth, the referee in bankruptcy, the company's plant will not be offered for sale at public auction, as it first advertised. It was decided at the hearing before the referee that a private sale would best serve the interests of all who are concerned.

TWO SALES DEPARTMENTS ARE MERGED BY HANDLEY

Unites His Interests in American and Marion in New Million Dollar Selling Company—Manufacturing Policies Unchanged.

To unify his interests and effect overhead economies in the American Motors Co. and the Marion Motor Car Co., of Indianapolis, of both of which he is president, J. I. Handley has organized the J. I. Handley Co., which, capitalized at $1,000,000, will consolidate all of his individual holdings in not only the American Motors Co., Marion Motor Car Co., American Motors Realty Co. and A. & M. Sales & Service Co., all of Indianapolis, but the American-Marion Sales Co. of New York and the American Motors California Co. of San Francisco.

The new Handley company will become the sole selling agent of the Marion and American Motors companies, all of the sales, advertising and service departments of both of those manufacturing companies being consolidated under the Handley direction.

The amalgamation will not affect in any way the individuality of either of the manufacturing companies. The American Motors Co. will do its own engineering, purchasing, financing and building and the board of directors and officers will be undisturbed. This also holds true for the Marion Motor Car Co. Under the new arrangement each manufacturing company will have one customer for its product instead of many, and will look solely to the one big customer for successful distribution. On the other hand, this one customer, the J. I. Handley Co., will come in direct contact with the many American dealers and Marion dealers, and it is believed the result must prove happy.

The relationship of the Marion dealer to the Marion car will remain just as individual as it is now, and likewise the relationship of the American dealer to the American Underslung car.

The most immediate result of the new order of things, so far as men are concerned, will be the removal of Vice-president Menasco to the Pacific Coast.

Handley himself will retain the presidency of the American Motors Co. and the Marion Motor Car Co., while V. A. Longaker, chairman and general manager of the American Motors Co., will become vice-president of the new Handley corporation. P. S. Menasco, vice-president of the American Motors Co., will continue in that capacity but will also become president and general manager of the American Motors California Co., which carries with it his removal to San Francisco, where his headquarters will be established.

Church-Field Electric in Trouble.

Aggravating delays in the production of its car, which impaired its working capital, have brought about the appointment of a receiver for the Church-Field Motor Co., of Sibley, Mich. It is believed, however, that its affairs can be straightened out and that the property will be taken over by a new company which will be formed for the purpose.

The Church-Field car itself is an uncommonly appealing electric. In general appearance, it so closely resembles gas cars as to almost defy detection. It not only utilizes shaft drive, wheel steer and a bonnet, but is marked by underhung suspension and a radical two-speed gear.

Magic Powder Leads to Bankruptcy.

The American Voltite Co., of New York, a $2,000,00 corporation which set out to at least partly revolutionize the world by marketing a more or less magical powder which, applied with a cloth, nickeled brass and other metals, went into the hands of a receiver late last week. Its liabilities are $50,000 and its assets $8,000. In a small way, the company attracted some notice in the automobile trade, many repairmen and owners believing that the powder would assist in solving the nickel plating problem.

Big Company Takes up Automobiles.

It is now an a[illegible] that the Standard Steel Car Co., whose [illegible] Into is in the Frick building in Pittsburgh. [illegible] gage in the manufacture of automobiles [illegible] that the big factory now building in Butler, Pa., will be utilized for that purpose. Statements to this effect have been confirmed by Motor World's inquiry. It will be several weeks, however, before additional information will be available.

Gray & Davis Get Detroit Plant.

In order to facilitate deliveries, Gray & Davis, of Boston, Mass., have purchased the Sprague-Waldo lamp plant at 19-23 Harper avenue, Detroit, and will take possession September 1st. This will give the Boston firm four large factories—two in Boston, one in Amesbury, which just has been enlarged one-third, and the new acquirement in Detroit.

Willys Incorporates English Company.

To better conduct his business in Great Britain, John N. Willys has organized and incorporated Willys-Overland, Ltd., with headquarters in London. It is capitalized at $50,000, in $5 shares, and is rated as a "private company." Willys and C. A. George are named as the first directors.

HIGH TEMPERATURES STILL RULE IN NORTHLAND RUBBER

Court Holds Bidwell's League and Its Secretary in Contempt—Cleared of One Charge, Bidwell is Then Sued for $100,000.

Whatever else they may succeed in accomplishing, A. C. Bidwell and his former colleagues in the Northland Rubber Co. are making lots of work for lawyers. Charges and countercharges have followed so thick and fast that it is difficult to keep track of them, but it is clear that at the adjourned hearing on Friday last, before Judge Laughlin in the Supreme Court in Buffalo, James J. O'Shea, secretary of Bidwell's so-called International Automobile League, and the League itself were adjudged guilty of contempt in that they had violated an injunction restraining them from continuing a campaign to secure stock in the Northland corporation by inducing holders of it to exchange their shares for stock in other Bidwell enterprises. Judge Laughlin announced that he will impose punishment as soon as he ascertains that he has jurisdiction.

Efforts of officials of the Northland Rubber Co. to have Bidwell indicted by a Federal grand jury for fraudulent use of the mails in circulating its literature failed of their purpose. Undaunted, however, they instituted a libel suit for $100,000 against Bidwell and three others, charging that their literature had defamed the Northland company. Civil warrants were isued for their arrest, and later Charles E. Grant, who printed the offending circular, was arre[illegible] and released on $1,000 bail. The oth[illegible] warrants were not served, and it is probable that the defendants whose names have not yet been permitted to become public will surrender themselves.

This is the second libel suit filed against Bidwell, the first one, as stated in Motor World last week, having been brought by James Bendure, consulting engineer of the Northland Rubber Co., who claimed that his professional reputation had been injured to the extent of $20,000.

Libel suits apparently being fashionable, Bidwell, it is understood, has brought several on his own account. He is said to have sued all of the Buffalo papers which printed the statement that he was in hiding in Canada when, as a matter of fact, he claims to have been there on business.

At last accounts, Bidwell himself had not yet appeared in court, but his answer to the Northland complaint had been presented. It took the form of an affidavit executed July 21st in Toronto, where it is stated he has been engaged in looking after his en-

Digitized by Google

terprises in that particular section of the dominion.

Bidwell's affidavit attacks George C. Riley, a lawyer, who is vice-president of the Northland Rubber Co., and charges him with having assisted in designing the Northland voting trust and a series of contracts through which Bidwell lost control. He admits that he organized the International Automobile League Tire & Rubber Co. which, after internal upheavals, changed its name to the Northland Rubber Co. in March last, and that the International Automobile League was to dispose of the stock under a contract made in December, 1911. Bidwell affirms, however, that the other officers interfered with his orders, rejected his suggestions and precipitated a crisis.

Out of the trouble grew a voting trust and later a new contract was entered into with Bidwell, or his "league," whereby stock held by the voting trust was returned to the Northland company, although the voting power remained with Lawyer Riley, according to Bidwell. A financial settlement of $152,000, which the Northland company claimed Bidwell or the league owed it, was brought about and Bidwell's resignation as president placed in the hands of a lawyer, but Bidwell's hands were so completely tied that he states that early this year he formally resigned.

In his affidavit, Bidwell also declares that by reason of contracts which were executed he was bereft of the power to use proxies. It appears that whenever his "league" sold a share of Northland stock it acquired a proxy to vote it and also an option to buy the stock if the proxy was cancelled. By reason of the contracts, the Northland management acquired control of these "league" proxies and Bidwell was left in the air. Then, apparently realizing that his more or less confiding nature had made him a victim of too many contracts, he began to print circulars and "do things."

Bidwell has found some support in Canada, several Canadian stockholders having joined him in opposing the continuance of the injunction. They join him in asserting that the present management of the Northland company is not to their liking.

Grand Rapids Truck Files Schedules.

Schedules in bankruptcy of the Grand Rapids (Mich.) Motor Truck Co., which were filed last week, disclose liabilities of $124,239.74 and assets of $110,006.81. Frank T. Hulswit, whose claim amounts to $31,694, and the Old National bank, of Grand Rapids, $38,990, are the heaviest creditors. Both claims, however, are partly secured. The first meeting of the creditors of the bankrupt company will be held September 16th next.

WEAVING WEED CHAINS IN WINNING WINDOW DISPLAYS

Providence Supply House Takes Chief Award in Chain Company's Contest—Awards Aggregating $250 to go to Twelve Dealers.

Just what ability in the window-trimming line is possessed by supply and accessory dealers was demonstrated in a contest just concluded by the Weed Chain Tire Grip Co., which was productive of a number of excellent windows, each of which indicated considerable effort and skill. Twelve prizes were offered, totaling $250. In addition, each winner is entitled to a certain amount of advertising in any paper he may select in his locality, the bills to be footed by the Weed company.

The first prize, $100, went to the Waite Auto Supply Co., of Providence, R. I., which arranged its window to represent a little village with houses, roads, railroads and the customary dangerous grade crossings, a snow scene and other effects, into which was woven the danger of skidding and the safety of Weed chains. The Waite window is at the point of a triangle, and miniature automobiles in the layout showed what can happen to an unprotected car. There were numerous wrecks and disasters on cars which had no chains, while the equipped variety found safety. The contest closed July 15 and checks will be mailed to-morrow, August 1.

The complete list of winners follows: First, $100, Waite Auto Supply Co., Providence, R. I.; second, $50, Bannister & Pollard Co., Newark, N. J.; ten prizes of $10 each—Tri-State Supply Co., White Plains, N. Y.; Albert E. Goodby, Providence, R. I.; Hamilton Hardware Corporation, Waterbury, Conn.; Blue Ribbon Garage, Bridgeport, Conn.; Herr & Co., Lancaster, Pa.; Post & Lester Co., Boston, Mass.; Louisville Auto Supply Co., Louisville, Ky.; Dayton & Walker Hardware Co., Paterson, N. J.; Ferris-Dunlap Auto Supply Co., Dallas, Tex.; Bi-Motor Equipment Co., Boston, Mass.

Midland Trustee Chosen After a Tussle.

After a sharp fight between conflicting interests, J. H. McCullough, a Peoria lawyer, has been elected trustee for the bankrupt Midland Motor Co., of Moline, Ill. McCullough was the choice of 156 creditors, representing $102,000, and was chosen over J. D. Metzger, of Moline, who represented 83 claims, the items of which aggregated $83,000.

It is stated that a disputed claim of the Racine Mfg. Co. for $55,000, which the referee allowed to be voted, decided the issue. During the course of the argument, it was intimated that a composition of 20 cents on the dollar would be offered and that the creditors represented by Metzger would oppose it.

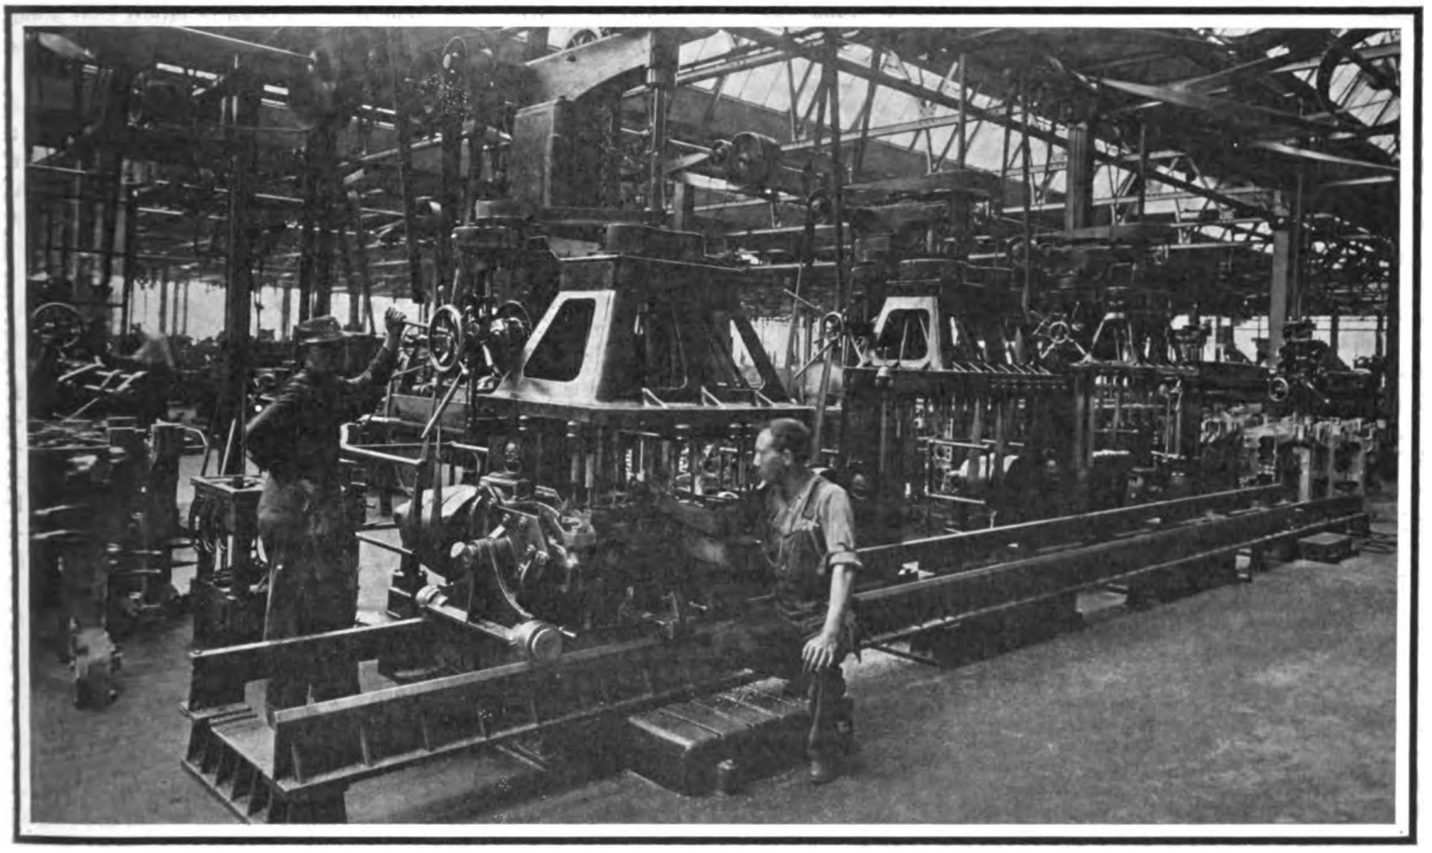
There will be another meeting on August 5th in Moline, when the officers of the bankrupt company will be examined. It is stated that a great deal of litigation is in prospect because of allegations of many preferential payments during the four months preceding the filing of the bankruptcy petition.

Great Britain's Exports and Imports Gain.

Great Britain's exports and imports both are still on the up-grade. For the six months ending June 31st last, the export of cars, chassis, parts and tires totaled £2,134,181 as against £1,618,874 during the corresponding period of 1912. The total is made up of cars to the value of £1,092,595, chassis £253,834, parts £291,767 ,tires £395,985. Prior to 1913, the tires were included in parts. The total for the first six months applies only to exports of British goods for, in addition thereto, reexportation was carried on to the extent of £417,658.

During the same period, Great Britain's imports also showed substantial increase—£3,812,441 as against £3,674,773 for the first six months of 1912. The imports were made up of cars, £918,495, chassis £1,003,005, parts £582,653, tires £1,308,288. During the corresponding period of 1912 there were imported cars to the value of £1,121,704, chassis £926,435, parts (including tires) £1,626,595.

Claims Repairman Damaged Her Car.



In an attempt to restrain the Auto Construction Co., of 2637-45 Cottage Grove avenue, Chicago, from executing judgment on three promissory notes which she gave it for the repairing of her car, Mrs. Florence E. Kirkpatrick has instituted injunction proceedings against the company. The latter secured judgment June 28. Mrs. Kirkpatrick says she placed her car in the hands of the company in April and that it was damaged while there. The bill rendered was for $568.50.

Dealer is Sued on $2,000 Tire Note.

Edward Maurer, as assignee of the Mansfield Tire & Rubber Co., of Mansfield, Ohio, filed suit this week in the Supreme Court for New York county against the Automobile Tire Co., of New York City, for $2,186.71, which is claimed as the unpaid face of a 90-days note; the paper is claimed to have been given March 14, 1913, for goods furnished. Edward C. Griffith is president of the defendant company.

The Week's Incorporations

FEW PERSONS OUTSIDE OF MOTOR FACTORIES KNOW WHAT A RAILROAD GANG DRILL LOOKS LIKE. THIS ONE IS IN THE DETROIT PLANT OF THE CONTINENTAL MOTOR MFG. CO. AND CAN DRILL 95 HOLES IN SEVEN MINUTES

Peoria, Ill.—Peoria Automobile Club, under Illinois laws. Corporators—H. C. Roberts, W. E. Hull, S. J. Nelson.

Cleveland, Ohio—The White Co., under Ohio laws; authorized capital, $2,500,000; to manufacture and sell motor cars.

Mount Jewett, Pa.—"DeWitt" Muffler Co., under Delaware laws; authorized capital, $30,000. Corporators—C. E. DeWitt, A. O. Downey, R. B. Rupert

Cleveland, Ohio—Original Auto Polo Co., under Ohio laws; authorized capital, $25,000. Corporators—Ralph A. Hankinson, R. Bert Worthington, A. E. Bernsteen.

Cleveland, Ohio—General Auto Parts Co., under Illinois laws; authorized capital, $10,000. Corporators—F. C. Walsh, M. Kepke, William Radtke, C. R. Cross, J. F. Johnson.

Albany, N. Y.—Capital City Vulcanizing Co., under New York laws; authorized capital, $1,000; to repair and deal in motor cars, etc. Corporators—John W. Giblin, John F. Cregan, Daniel H. Cregan, all of Albany.

Joliet, Ill.—Joliet Motor Co., under Illinois laws; authorized capital, $10,000; to conduct a garage and general motor machinery business. Corporators — W. S. Campbell, John H. Garnsey, Maurice F. Lennon.

Latrobe, Pa.—Latrobe Automobile Turntable & Jack Co., under Delaware laws; authorized capital, $100,000. Corporators—J. Gilligan, Latrobe; T. H. Griffin, W. B. W. Bryan and N. L. Bogan, of Pittsburgh; C. J. Jacobs, Wilmington.

Brooklyn, N. Y.—Bridge Plaza Garage, under New York laws; authorized capital, $1,000; to conduct a garage. Corporators—Charles Beaumann, 210 March avenue; Leo Costello, 55 South Fourth street; Norman Murray, 225 Division avenue.

New York, N. Y.—Eclipse Garage Co., under New York laws; authorized capital, $6,000; to conduct a garage. Corporators—Thomas J. Cardiff, 100 West 71st street; Walter A. Builder, 272 Manhattan avenue; John Mano, 182 West End avenue.

New York, N. Y.—Metropolitan Public Motor Corporation, under New York laws; authorized capital, $1,000. Corporators—James O. Tryon, 30 Broad street; Eleanor A. Mathews, 1698 Topping avenue, Bronx; Clayton R. Olena, 55 Liberty street.

Philadelphia, Pa.—Pennsylvania Omnibus Co., under Pennsylvania laws; authorized capital, $300,000; to manufacture and operate motor cars and establish a taxicab service.

Chicago, Ill.—Automobile Service Co., under Illinois laws; authorized capital, $30,000; to conduct a motor livery. Corporators—H. Decker, S. J. Richman, P. R. Mayer.

Syracuse, N. Y.—Bennett's Garage, under New Yor klaws; authorized capital, $5,000;

Digitized by Google

to conduct a garage. Corporators—George F. Brainard, Sidney B. Johnson, George W. Bennett, all of Syracuse.

Wilmington, Del.—American Motors Co., under Delaware laws; authorized capital, $500,000. Corporators—F. A. Hyde, F. B. Smith, Baltimore, Md.; C. G. Guyer, Wilmington.

Claremont, Ill.—Claremont Garage, under Illinois laws; authorized capital, $2,500; to conduct a garage and repair shop. Corporators—James F. Hutchinson, Jacob Diamond, Annie S. Winslow.

Chicago, Ill.—T. S. Wheel & Mfg. Co., under Illinois laws; authorized capital, $2,000; to manufacture motor cars and accessories. Corporators—S. Fred Schulz, Theodore J. Smulski, Stanley Zukowski.

Martinsville, Ind.—Citizens' Automobile Co., under Indiana laws; authorized capital, $25,000; to conduct a garage. Corporators—Walter E. Hendricks, Walter A. Kennedy, Edwin L. Poston and others.

Chicago, Ill.—Stewart Auto Accessories Co., under Illinois laws; authorized capital, $1,500; to manufacture and sell motor car accessories. Corporators—F. W. Stewart, Lesley L. Kennedy, James A. Steven.

New York, N. Y.—Zip Sales Agency, under New York laws; authorized capital, $15,000; to deal in motor car accessories. Corporators—George W. Phillips, Jr., Victor W. Cutting, A. E. Hall, all of 60 Wall street.

New York, N. Y.—Consolidation Auto Supply Co., under Delaware laws; authorized capital, $500,000; to manufacture, sell, deal in and prepare for market all kinds of motor cars and boats. Corporators—H. O. Coughlan, F. Schmidt, both of New York City.

Brooklyn, N. Y.—Rambler Motor Car Co., under New York laws; authorized capital, $5,000; to deal in motor vehicles. Corporators—G. Rudolph Ruckert, 488 Nostrand avenue; B. Fletcher Donnocker, Northport, L. I.; James B. Smith, 467 Grove street.

New York, N. Y.—Twombly Car Corporation, under New York laws; authorized capital, $500,000; to manufacture motor vehicles. Corporators—D. Stuart Dodge, Hotel Ansonia; W. Irving Twombly, 208 West 86th street; Henry W. Jessup, 55 Liberty street.

Increase of Capitalization.

Detroit, Mich.—Traveler Motor Co., from $15,000 to $50,000.

Akron, Ohio—Akron Gear & Engineering Co., from $20,000 to $50,000.

Detroit, Mich. — General Aluminum & Brass Castings Co., from $75,000 to $150,000.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve to Place Many Workers in New Places—Few Leave the Industry.

E. R. Hand has been appointed district manager of the Marion Motor Car Co. for the Middle West. Previously he was with the Abbott Motor Co., of Detroit.

Albert S. Halley has resigned the management of the Kelly-Springfield Motor Truck Co.'s New York branch to become manager of the truck department of the Packard Motor Car Co., of Boston.

Cassius F. (Cash) Baker, one of the best known travelers in the West, has connected with the National Motor Vehicle Co. of Indianapolis. His duties, of course, will continue to keep him circulating among dealers.

H. W. MacKaye has been appointed manager of the Keeton Motor Co.'s Detroit branch, which just has been established at 728 Woodward avenue. MacKaye has been identified with the company since its organization and, therefore, is no stranger to his duties.

Wallace C. Hood has been appointed commercial manager of the Empire Automobile Co., of Indianapolis, which carries with it supervision of the sales and advertising departments. Hood was at one time sales manager of the Chalmers Motor Co. and later of the Metzger Motor Car Co., of Detroit.

C. R. Burt, of Rockford, Ill., has been appointed factory manager of the Russell Motor Car Co., of Toronto, Can., succeeding M. MacDonall, resigned. Burt was for nine years connected with Brown & Sharpe, in Providence, but for the past eight years has been general superintendent of the Barber-Coleman Co., of Rockford, which produces textile and automobile machinery and parts.

E. A. Scheu, manager of the Invader Oil Co.'s Boston branch, has been promoted to the post of sales manager, which carries with it removal to the company's headquarters at 50 Broad street, New York. Scheu was for many years with the Packard Motor Car Co. and for eight years New England representative for E. A. Kellam & Co., which firm was succeeded by the Invader Oil Co.

George H. Kelly, manager of the truck department of the Baker Motor Vehicle Co., of Cleveland, has been advanced to the office of secretary and sales director. R. C. Norton, heretofore secretary and treasurer, will continue as treasurer. E. J. Bartlett becomes sales manager of the truck department, and O. B. Henderson continues as sales manager of the pleasure car department.

Minor Business Troubles.

The Federal court in Boston has adjudicated a bankrupt the Taxi Meter Cab Co., which has been in the hands of receivers for some time; it is anticipatetd that about $30,000 can be realized from a sale of the assets. The liabilities are about $210,000.

Harold B. Elgar, as trustee in bankruptcy of the Automobile Fault Finder and Anti-Forgery Electric Pen Co., will auction the bankrupt's assets August 8 at 10.30 A. M. at 535 Broadway; the assets consist principally of anti-forgery electric pen patents.

T. J. Linehan, Jr., manager of the Trumbull street store for the Auto Owners' Supply Co., of Hartford, Conn., has been appointed receiver for the company; a bond has been furnished and Linehan will continue the business for four months. Financial troubles have lately beset the company, which has stores at 284 Trumbull street and in Newington, and which is headed by Former Senator John M. Brady, of New Britain.

The F. L. C. Martin Automobile Co., of Plainfield, N. J., one of the oldest dealers, having started in the bicycle business in 1889 and progressed into the automobile trade in 1902, has filed a petition in bankruptcy; it states that its assets are $102,633.72 and its liabilities $53,533.51. The assets include $18,000 insurance and are otherwise so involved as to be not immediately available. It is stated that the bankruptcy court was sought because of the continued ill health of Martin, who desires to close out the business in order that he may better apply himself to the task of regaining his physical well being.

Recent Losses by Fire.

Oyster Bay, N. Y.—Auto Tire Repair Co., building damaged. Loss not stated.

Freeport, Ill.—J. E. Thompson, 455 North Broadway, garage damaged. Loss, $8,000.

Boston, Mass.—Premier Motor Car Co., Beacon street, garage damaged. Loss, $1,500.

Binghamton, N. Y.—Binghamton Motor Car Co., machine shop damaged. Loss, $1,000.

Ansonia, Conn.—Edward Crane, 79 Elm street, garage and contents damaged. Loss not stated.

Detroit, Mich.—Maxwell Motor Co., one-story storage house containing 100 barrels of varnish, totally destroyed. Loss not stated.

In the RETAIL WORLD

COLE SALES STAFF AND DEALERS LISTENING TO AN ADDRESS ON STANDARDIZATION DURING THE RECENT CONFERENCE IN INDIANAPOLIS. IT WAS NOT WHOLLY A "DRY" PROCEEDING.. WITNESS THE TABLE AT THE LEFT

The City Auto & Machine Co., of Latrobe, Pa., has completed a new garage. It is located on West Depot street.

John Umbel plans to open a garage in Leatherwood station, W. Va. He will locate in the B. C. Nichol building.

A new fireproof garage has been erected for the Winton agency in Cincinnati, Ohio. It is located at 324 West 7th street.

Holland Garage is the style under which a new business has been launched in Orange, Tex. Judge Holland is the owner.

The Hardman Tire & Rubber Co., of New York, has opened an agency in Philadelphia at 1936 Sansom street; J. A. McTaggart is manager.

The Veihl-Crawford Hardware Co., of Fort Worth, Tex., has entered the automobile trade; it has added both cars and supplies to its stock.

The Neighbors Motor Car Co., of Cleveland, Ohio, has opened a branch in Youngstown, in the same State; it is located at 209 South Champion street and is managed by J. W. Keues.

The Hemet (Cal.) Garage has been purchased by Crosson & Whetstone, of San Jacinto, in the same State. New equipment will be installed and the new owners will operate the business.

The Homer Motors Co., of 1326 Washington building, Los Angeles, is about to erect a three-story, reinforced concrete building, 150 x 350 feet. The site is on San Fernando road, near Arvia street.

The Loveland-Estes Park Auto Co., of Loveland, Col., has had erected on West 4th street a garage which is one of the largest in Northern Colorado. The company operates a fleet of nine Stanley steamers.

Charles Smyth, Jr., formerly half owner of the Cadillac Service Station in Wichita, Kan., has withdrawn from the trade; T. J. Holdridge, Jr., is now in full control of the business and plans to enlarge its scope.

O. D. Strader, of Nicolotte, W. Va., has purchased the interest of L. C. Mead in the Market Garage & Machine Co., of Parkersburg, in the same State; he will incorporate the business and improve the premises.

R. E. Newell has entered the trade in Waterloo, Ia., as a dealer. He has taken possession of the Iowa Auto Co.'s former location at 185 Park avenue West, and the latter concern has removed to a new building at 410 5th street West.

The King Motor Car Co.'s branch in Sioux Falls, S. D., plans to erect a one-story warehouse and garage at 5th avenue and 13th street; this is made necessary by an increase in territory, the branch now caring for all of South Dakota and one Iowa and three Minnesota counties.

Its taxicab business having assumed considerable proportions, the R. D. & C. O. Britton Co., dealer, of 115-21 Allyn street, Hartford, Conn., has incorporated a separate company to handle it; the new concern is the Pioneer Taxicab Co. and has its headquarters at the same address.

Morgan N. Smith, formerly connected with the Cleveland (Ohio) Automatic Machine Co., has taken over the Acme Machine Co., of San Diego, Cal. The company operates a garage on 13th street, between G and Market streets. and has the Hender-

Digitized by Google

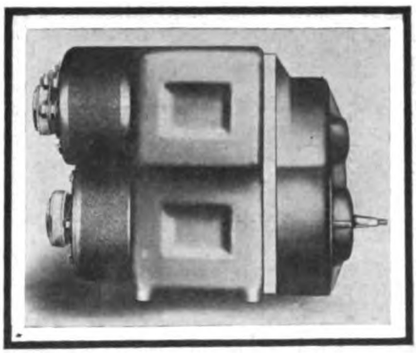
son agency for both San Diego city and county.

The Dallas (Tex.) Automobile Club has appointed a committee to investigate the feasibility of opening a cooperative garage, supply store and repair-shop for the club members; the committee consists of Gilbert H. Irish, chairman; C. W. Miller, Z. E. Marvin, H. A. Overbeck and J. B. Seeger.

D. S. Kruidenier, proprietor of a garage in Des Moines, Ia., at 1119 Locust street, has plans for a new building to be erected on Locust street, between 11th and 12th streets. October 1 the Cole Motor Car Co., which is now at 17 12th street, will take possession of Kruidenier's present quarters, first having them remodeled.

The Gerlinger Motor Co., of Portland, Ore., has opened a branch in Seattle, Wash., at Broadway and Pike street. Edward E. Gerlinger, the proprietor, has enlisted W. H. Miller, for three years manager of the Pacific Motor Car Co., of Seattle, as assistant manager. Gerlinger handles Herreshoff cars and Menominee trucks.

The California Moline Plow Co., of Los Angeles, has "gone into" pleasure cars; it previously had the International truck agency and has now taken over the Carter-car agency in that city. A. R. Davis, formerly with the Vance-Caravan Co., of that city, is connected with the California Moline's new pleasure car department. C. I. Dorn is its truck manager.



The Pathfinder Pacific Motor Sales Co. has been formed in San Francisco to distribute Pathfinder cars in Northern California, Nevada and the Hawaiian Islands; it has no connection with the Los Angeles distributing house. The officers are: President, James H. Borland; vice-president, J. R. Pringle; secretary-treasurer and general manager, J. M. Whited; sales manager, Barry Cool. The company will utilize a new building on Geary street, near Van Ness avenue, and will maintain branches in Fresno, Sacramento and Watsonville, Cal., Reno, Nev., and the Hawaiian Islands.

A four-story, fireproof building, 100 x 104 feet, with a one-story service building of the same dimensions at the rear, is to be erected in Cleveland, Ohio, at Euclid avenue and East 20th street, for the Cleveland Cadillac Co. T. H. Towell, president of the company, has signed a ten-year lease of the structure which will represent an expenditure of $100,000. It will be ready for occupancy January 1, 1914. The building will be of steel, concrete and brick with a white terra cotta front. The first floor will be devoted to display rooms and a woman's rest room and the second floor to offices. The third and fourth floors will house the mechanical equipment.

Harry B. Blair, of Livingston, Mont., has completed a new garage, 50 x 140 feet, at Clark and Main streets and with entrances on both thoroughfares; the garage includes the customary machine and repair departments and has a modern ladies' waiting room. Blair, who is Reo and Ford dealer, has given his establishment prominence by painting the front of the building a bright red.

Disco's "Double-Decker" Device.

The Disco electric lighting and engine starting instruments, which are produced by the Disco Co., of Detroit, Mich., and which always have been distinctive by reason of the extreme narrowness, are to be still more distinctive, for the manufacturers have brought out a new type of machine quite different from the originals. The new instrument is styled a "doube-decker," from which it may be gathered that it virtually is two machines, one mounted directly over the other; it is shown by the accompanying illustration. One of these is the generator and the other, of course, the starting motor, and they are arranged in this way in order to economize space.

DELCO DOUBLE-DECKER

Although there are separate armatures for generator and motor, there is but a single drive, or rather, a single drive connection; the generator is driven at 2 to 1 with the engine crankshaft, and the motor drives the gasolene engine through a spur reduction gearing, giving a ratio of from 11 to 1 to 30 to 1, according to the size and characteristics of the motor to which it is attached. All of the gears are constantly in mesh, the interposition of a compact four-point roller clutch preventing the motor from being driven by the gasolene engine; as usual, the generator is of the shunt-wound type and its output is controlled by a combination of armature reactions and a bucking coil. The battery is prevented from discharging back through the generator by a new form of automatic cut-out in which there are two sets of contacts, one set being carbon and the other set copper; as the carbon contacts close first and open last, sparking is effectually eliminated. Machines are made to operate on both six and 12-volt circuits, and though the new "double-decker" will be the leader for the coming season, the older type machines are to be continued.

May Manufacture Tires in Seattle.

E. K. and A. K. Allen, Seattle, Wash., who for years have handled either the Pennsylvania or Republic tires in that part of the country, are preparing to go into tire manufacture on their own account. They have invented a non-skid tread and, it is stated, have promises of "practically unlimited financial backing" for the factory which they contemplate establishing in that city.

To Assemble Moreland Trucks in 'Frisco.

The Moreland Motor Truck Co., of Los Angeles, which manufactures the distillate burning truck of that name, is preparing to establish an assembling plant in San Francisco at Fourth and Harrison streets. It will be in charge of J. S. Phillips. The chassis will be built in the Los Angeles plant and the bodies and final touches be applied in San Francisco.

Making Room for More Crankshafts.

The Auto Crankshaft Co. is erecting a brick and concrete addition, 50 x 165 feet, to its plant in Detroit. This enlargement will increase the output to about 75,000 crankshafts per year, an increase of approximately 50 per cent. It is probable that in the fall another building of the same size will be erected on an adjoining plot of real estate.

Multibestos Removes to Framingham.

The Standard Woven Fabric Co., which manufactures Multibestos brake lining, among other things, has taken possession of its new factory in Framingham, Mass. The new plant is very much larger and, of course, more modernly equipped than the one in Worcester, which has been abandoned.

More Money for Grabowsky Creditors.

The Security Trust Co., of Detroit, receiver for the Grabowsky Power Wagon Co., is making a distribution of about $45,000 to the creditors, bringing the total dividend to about 50 per cent. It is probable that another small dividend will be disbursed later.

Walker Electric Gets Into Cincinnati.

The Walker Electric Vehicle Co., of Chicago, has opened an office in Cincinnati at 515 Mercantile Library Building, and later will establish a service station. The office is in charge of C. E. Ogden, as district manager.

SEEING THE LIGHT IN GREAT BRITAIN.

From the day the American automobile first appeared upon the British market the British public, with great unanimity, decried it, characterizing it as homely and uncouth, as rough and unrefined, as over-engined and overweighted—in short, as a thing very different from the home product and, therefore, far less desirable. While it is true that to a certain extent this expression of feeling has been prompted by intense patriotism and loyalty to indigenous products, it is more than hinted, even in John Bull's own territory, that not a little of it has emanated from sources not unconnected with the British automobile industry.

But while trade-fostered anti-American sentiment may be expected to endure to some extent regardless of facts, however cold and hard, the Britisher who shouts for the "all-British" car because he honestly believes it is the best is amenable to reason, and not a few thousands of his ilk have been discovering that the trouble with the American car has been in the British point of view, so to speak. The British point of view is naturally the result of observation of British conditions, and they are so radically different from American conditions as to render the resulting deductions worse than worthless. The oft-repeated fact that the American car is built for American roads, and its correlative fact that American roads are abominable, must be considered when passing on the relative merits of the cars, and it has happened time and again that over-seas visitors who have observed the American car in its native habitat have been unreservedly converted and have said so.

A member of the party of British automobile engineers which recently visited this country has written of his impressions to an English motor paper, and he is not slow to point out the fallacy of judging a fish by its actions on dry land. After an outburst born of his first intimate acquaintance with American roads, he says: "The first country run does more than educate the visitor in regard to the road system; it raises the American car many points in his estimation. A production which can give satisfactory service under such truly awful conditions has to be made well, and has, moreover, to be specially designed for its work. It may sound dreadful heresy; nevertheless, let it be said right away, as definite expression of opinion, that the average English car, constructed for and tested on our own roads, would not stand up for six months under such treatment."

Not only is this true—as has been appreciated by Americans from the first—but it also is true, as the British correspondent further remarks, that the reason for the fact that British colonies seem to prefer American cars is that they are built for just such roads as exist in the colonies, while British cars are not. While European cars are very good cars under European conditions, they are entirely unsuitable for really rough going. On the other hand, it stands to reason that an American car, which is capable of giving good service on abominable American roads, should be able to move as well and last very much longer on the good roads of Europe. And the way in which American makers sell their cars in competition with the British or other European product, would seem to indicate that there is much in this reasoning, despite the loud cries of foreign dealers concerning the cheapness and nastiness of everything that is American, particularly automobiles.

WHY THE TREND TO LEFT-SIDE STEER.

The increasing rapidity with which automobile makers are embracing the doctrine of left-side steer brings into strong relief the fact that the principle involved has been recognized from the first.

The American driver always has been on the right side because that is where he was when all Americans were Englishmen; but in those days the rule of the road was, as it now is in England, "keep to the left," and the driver on the right could clearly see the vehicle he was passing. In changing the rule of the road, however, Americans have retained the right-hand driver's position—an anomaly that has persisted for so long that it has been not a little difficult for many people to see why it should not continue to exist. The driver on the left side can see those things that he most needs to see—the vehicles moving in the opposite direction—and the things that are on his right and therefore less easily seen are stationary or else moving in his own direction, and therefore less menacing.

Drivers experienced in left side steering state emphatically that accidents are more easily avoided than when the wheel is located on the right.

ONE TALE OF FOUR BULLS, OR, WHAT IS A BULLKONN?

Being the Narrative of the Deeds of a Quartet of Bovine Gentlemen to Anger Stirred—What, Whom, How and Why They Did.

"Once upon a time there were three Jews," is the burden of a song which has been sung more or less for years, but for the purposes of the present occasion the line is altered to read, "Once upon a time there were three bulls." Which means that this is a bull story—not the kind that is sometimes "shot" by automobile salesmen, but the kind which sailed with Noah in the ark, and is therefore an ancestor of all things bovine.

Rather, there are four bulls, but only three bull stories. As to the first one, Dr. M. F. Maxwell, president of the County Fair Association, of Paris, Tex., is the sponsor for it and the owner of the two bulls that play the leading parts. While not actually sworn in, the bulls—the Durham breed—took the parts of three or four dozen deputy sheriffs at a racemeet which the association recently staged, and the doctor won several hats by demonstrating that he could keep the curves of the county fair dirt track cleared of spectators without an army of deputies.

When the doctor was informed that he could not stage the meet unless the curves were kept free of people, there were those who anticipated trouble for the physician—the "those," however, did not include Dr. Maxwell. When the 4,000 spectators flocked upon the field some of them jumped over the fences and made for the large, clear fields about the ends of the curve. But they much more speedily jumped right back again, for they were greeted by the two Durham gentlemen, who seemed to appreciate the fact that they had been deputized to keep the "fool public" away from those curves.

Look out! Here comes another bull! This concerns Joseph Coffee, of East Orange, N. J., and the next time he spots a herd of cattle in the road ahead it is safe to assume he is going to be more considerate of the bovine feelings than he was Sunday, 27th inst., when he encountered several lady cows and their gentleman escort on the road near Canajoharie, N. Y. Also, it isn't safe for a red car from "Jersey" to take liberties with "Yoke State" cows.

Coffee, perhaps, isn't entirely to blame, for those who use the highways of any part of the world are familiar with the cow's womanly habit of changing her mind at the last minute and deciding to cross the road just as a vehicle approaches. One of the herd which did this was struck by the car and she forthwith bellowed for help—and not in vain.

The gentleman cow hurried to the scene. He took one look at Coffee and the car, said "Oh! So you did it, did you?" and proceeded to "make a bum" out of the little red gasolene wagon. The car may get over it, but it will never be the same car. But that didn't terminate Coffee's troubles, for the owner of the herd, not satisfied with what the bull had done, had Coffee arrested and the outcome of the legal end of the matter will depend upon the outcome of the cow's injuries.

Bull No. 4, the hero of bull story No. 3, lives in Huntley, Ill., and his master is Peter Breen, a farmer; that is, Breen always considered himself the master until last week, when he went out into the pasture to issue orders to the bull. A young rebellion ensued immediately, and the rebellious subject had broken three of Breen's ribs and was just trying to locate a fourth when a motorist saw Breen's predicament. The car driver took down a pair of bars, honked his horn as ferociously as possible and put the bovine fighter to flight.

Cheyenne Church on Motorists' Trail.

Since the church attendance fell off this summer because those who attend in bad weather would rather motor when the days are fine, the clergymen of Cheyenne, Wyo., not being able to bring the motorists to church, have decided to take the church to the motorists; a majority of the car-owning church people spend their Sundays on Sherman mountain, wherefore the clergymen have decided to inaugurate a church service at this place on Sundays. It is estimated that this "nearer-Heaven" location will draw an attendance of about 400.

The services are to be not exactly denominational, for clergymen of several denominations will take part and an effort will be made to make the venture appeal to the public generally.

A. C. A. Bows to Blue Book Copyright.

The suit brought by the Automobile Blue Book Publishing Co. against the Automobile Club of America for infringement of copyright in the publication of the Tour Book issued by the club has been settled out of court. In the settlement the A. C. A. makes a payment of $7,000 and withdraws its contemplated road book from publication for this year. The club also agreed to purchase 1,000 Blue Books for distribution among its members. In their complaint, the Blue Book people charged that the A. C. A. had "pirated" their maps and road data, even to the "lifting" of errors.

GALVESTON BEACH HONORS ARE WIDELY DISTRIBUTED

Disbrow Takes "Big" Race but Others Earn Their Keep—Nikrent Badly Hurt—Time Trials Declared Void Because of Timer.

Galveston, Texas, which has a section of beach hard rolled by the Gulf, and which has been trying for three years to mantle itself with some of the glory which once attached to the Daytona beach in Florida, made its 1913 bid for popularity and publicity this week with a three-day automobile racemeet in connection with the Galveston Cotton Carnival. The events were run Monday, Tuesday and Wednesday, 28th, 29th and 30th inst., and there were races aplenty, the feature being a 300-mile $5,000 sweepstakes run in three sections, 100 miles each day for three days.

In this big event, although Louis Disbrow in his Simplex was the winner, it was by no means a walkaway. Disbrow took the first and third "installments" but lost Part II to Ferguson. Totaling his time for the three parts gave Disbrow the race by six minutes. His time was 4:17:23.90; LeCain (Stutz) was second in 4:23:25.45. Bill Endicott in a Case was third, and Moseley in a Studebaker, fourth. The prize of $5,000 was split, $2,500, $1,200, $500 and $300, with $100 added for the winner in each of the five classes which were admitted to competition.

The first day's running of 100 miles went to Disbrow in 83:59.48 and second place was taken by Chandler in a Mason special. Endicott captured third position. At the close of the second 100 miles the best time for this section was accredited to Ferguson in a Peugeot who totaled 83:57.30. Disbrow was second and LeCain and his Stutz third. In Part I of the feature event, Mulford gave Disbrow a neck and neck fight for the first 25 miles, or until he broke his clutch, which put him out of the running. The Peugeot developed trouble after winning the first day's 15-mile event and could not be started until the mechanicians had worked an hour and a half on it. Ferguson, however, found his speed again on the third day, and won the 25-mile, Class E, 450 cubic inches displacement event in 22:26.

In the last event of the last day, a 10-mile free-for-all handicap, Joe Nikrent, in a Case, was badly injured. There were twenty starters, the beach was crowded, and after Nikrent had forged to the front he pulled over too far from the sea and his car dropped into loose, soft sand. The steering wheel turned in his hands, all four wheels collapsed and the wreck collided with two empty touring cars which were drawn up along the course. Nikrent was the only one injured; his stomach was cut by barbed wire of a fence and his recovery is by no means assured.

The mile time trials were unsuccessful. The automatic timing device failed to work satisfactorily and all of the trials were declared void and the entry fee returned.

The race management announced at the close of the contest that larger prizes would be awarded next year. Just before the opening of the meet the center section of the grandstand collapsed but no serious injuries resulted and this minor accident had no effect on the holiday crowd. The summary:

Monday, July 28.

Ten miles, Class E, 230 cubic inches and under—Won by George Dewitt, Gila Monster; second, Moseley, Studebaker special; third, Mulford. Mason special. Time, 11:07.85.

Ten miles, Class C, Division 3, 231-300 cubic inches — Won by Chandler, Mason special; second, Ulbrecht, Case; third, Horan, Mercer. Time, 9:58.20.

Fifteen miles, Class C, Division 4, 301-450 cubic inches—Won by Ferguson, Peugeot; second, Mulford, Mason special; third, Rickenbacher, Mason special. Time, 11:59.29.

One mile, free-for-all, flying start—Louis Disbrow, Jay-Eye-See Fiat, time 32.10; Ferguson, Peugeot. Time, 35.14.

First 100 miles of 300-mile, 3-day, $5,000 Carnival Sweepstakes—First, Louis Disbrow, Simplex; second, Chandler, Mason special; third, Bill Endicott, Case. Time, 83:50.40.

Tuesday, July 29.

Ten miles, Class C, 161-300 cubic inches—Won by Chandler, Mason special; second, Bill Endicott, Case; third, Mulford, Mason special. Time, 9:09.82.

Twenty miles, Class E, 450 cubic inches and under—Won by Mulford, Mason special; second, Ferguson, Peugeot; third, Bill Endicott, Case. Time, 15:59.

One mile, free-for-all, flying start—Disbrow, Jay-Eye-See-Fiat, time 31.11; Ferguson, Peugeot, time 34.20.

Ten miles, Class E, 230 cubic inches and under—Won by Mulford, Mason special; second, Dewitt, Gila Monster; third, Moseley, Studebaker special. Time, 9:41.20.

Second 100 miles of 30-mile, 3-day, $5,000 Carnival Sweepstakes — First, Ferguson, Peugeot; second, Disbrow, Simplex; third, Le Cain, Stutz. Time, 83:57.30.

Wednesday, July 30.

Last 100 miles of 300-mile, 3-day, $5,000 Carnival Sweepstakes—Won by Disbrow, Simplex, 4:17:23.90, $2,500; second, J. LeCain, Stutz, 4:23:25.45, $1,200; third, Bill Endicott, Case, 4:46:21.56, $500; fourth, Moseley, Studebaker special.

Twenty-five miles, Class E, 450 cubic inches—Won by Ferguson, Peugeot; second, Endicott, Case; third, LeCaim, Stutz. Time, 22:26.

Ten miles, free-for-all—Won by Endicott, Case; second, Rickenbacher, Mason special. third, Disbrow, Simplex. Time, 12:17.40.

"200" Club Means Both Miles and Members.

Just what is the meaning of the "Chicago 200 Club," which organized and held a trial for admission of its first members early this month, is made plainer by additional information regarding this form of organization, which now bids fair to take more or less hold in other cities; Detroit is about to inaugurate one, and hopes to do better than Chicago did, the latter city having but 13 in its initial trial.

The "200" has a dual meaning; it means both 200 miles and 200 members. The former stipulation is fixed, but the latter may be increased, if necessary, by a vote of the club. To become a member a car owner must give notice that on a certain day he will attempt to drive 200 miles in not more than 10 or less than 9 hours, not covering the same road twice and not stopping his motor. If he succeeds, he is a club member, and if he fails to start or fails to achieve what he attempts he is penalized $5. Members will be given a gold wheel badge with a white enameled tire, and for every succeeding 200 miles negotiated a gold spoke will be added to the wheel. In other words, the 200-mile non-stop run will be to members of the club what a century run is to bicyclists whose rules provide for similar self-decorations.

The promoters of the project state that the object of the organization is to increase touring on the part of car owners. Many now are familiar with the roads surrounding the cities in which they reside but permit a chauffeur to guide the car when on tour, whereas under the club arrangement a car owner must be the driver.

Sheriff Arrests Entire Motoring Club.

A distinction which is unique, to say the least, attaches to the Grand Junction (Col.) Motor Club, for every member has been arrested and fined, but this does not imply that an arrest is essential to membership; the distinction is further unique in that the records of arrest were established all on the same day. All of the club members were out in their cars on a recent Sunday and what the sheriff thought of the way they drove was learned the next morning, when he haled the whole club before the judge. Fines of from $25 to $600 were imposed for speeding.

SERVICE — THE GREAT ASSET

Business Quality Which Exerts Powerful Grip on Garageman's or Dealer's Patrons—How it Made a Business "Grow in a Day."

On every hand, in every line of business, the observer notes the strong, powerful grip exerted by that undefinable element in business that is nevertheless very tangible to every customer—Service. Each business has its peculiar forms of "service." In most of them it is not included in the contract nor wrapped up in the package, but it makes itself felt just the same.

Tell Employes What Service Can Do.

Employers can do no greater task for employes, for themselves, for their business than give to employes a clear and definite idea of what "service" means to the "house"; how it attracts and holds trade in spite of price competition; how it secures better prices; how it gets the preference; and in general promotes the most satisfactory business relations. "Service" is the keynote of modern business. It works just as effectively for a small institution as for a large one and creates word-of-mouth advertising that cannot be beaten.

A man does not have to wait till he has been in business several years before he gives "service." The first customer he has can be made to feel the spirit of it—the reality of it. And just as sure as he feels it he will begin to boost. And that "boost" means another, perhaps several more, customers. For service builds trade faster than any other element in business.

Two Young Men Who Started Right.

Two young men got out of a job through the failure of the factory with which they were connected. They were practical mechanics. They had no fancy ideas about business; they had saved a little money and they decided to risk it in a small garage. They knew automobiles and they had some friends who knew they could do good work, who knew they were honest and conscientious and dependable. They rented a stable for a workshop and then sent notices to a few people. First day they got one job; second day two or three. After the first week they had four men working for them—and they averaged seven to ten repair jobs on hand all the time.

Thorough Work and "Service" Did it.

They did not have even proper equipment to start with. Often they had to go out and borrow a tool or have the work done for them; but they kept at it and the work they did was thorough. When they took an order for "doping" a rear axle they actually put the grease in it; they never short-changed their customers. They worked like Trojans. Pretty soon they were able to tackle any job. In four months they had rented a garage on the main street of the city and were enjoying a more profitable business than many older concerns.

Pinned right down to brass tacks, the one feature that made their business and attracted customers was "service." Service to them meant not only doing what the customer ordered but looking over a car with a view to seeing what else was the matter and remedying that; promptness and truthfulness about delivery of work; alertness for the interest of the customer—and always a disposition to favor the customer. It has won big things for them already; it is going to bring into their hands a still greater business.

VALUE OF KNOWING LIGHTING AND MOTOR STARTING SYSTEMS

The lighting and starting system is one of the strong selling points of present-day cars; prospects are anxious to know about them, and no salesman can afford not to be informed about them. Knowing your own system is not enough; you should be posted on the type which is installed in your competitor's car. If a Y. M. C. A. offered a course in these systems many salesmen might be tempted to take it; but this is unnecessary.

Practically every system in vogue has been described in detail in a series which recently concluded in Motor World; these technical analyses are written in a manner which is comprehensible to the untechnical salesman as well as to the man of greater engineering knowledge. Motor World has received numerous requests from men for copies which they had lost containing some one of these descriptions. If you haven't done so, dig into the back files of your Motor World and give yourself a course in starting and lighting.

UTILIZING GARAGE SPACE TO THE BEST ADVANTAGE

How to store the largest number of cars in the space at your command and how to keep customers from encroaching an extra foot or two and thus displacing one or two cars on a side, is a task that is well worth figuring out. The difference between storing 60 cars and 66 by using every foot of floor space intelligently is a nice comfortable little profit.

Ed Brosch of the North Woodward Garage in Detroit has worked it out, down to the last six inches. He has taken the standard tread and figured out a space that will accommodate cars of ordinary width and then marked it out on the cement floor with white paint. Each space is numbered. Each customer is given a number. He knows exactly where his car goes. When the big garage is filled up at night it is impossible to see where one more car could go. There is absolutely no waste of space, and yet there are very few accidents to fenders or bodies, because each man watches the line carefully and keeps his car on his side of it.

CREATING DULL-TIMES TRADE

Methods by Which a Dealer Filled His Store with Customers When Stock Was Moving Slowly—Cut Prices Sold "Uncut" Goods.

An automobile equipment company that had been having a rather dull time decided to stir things up and see if there really was any business obtainable. They thought they could not afford to advertise in the local papers because the rates were so high—and besides they did not have the money. They did not even wish to expend money for a painted sign, but they made up their minds to get people into their store some way or another. They succeeded; and this is the way they did it:

The Sign that "Waked Folks Up."

On Monday morning their store opened up with this sign in the window—made by hand with a marking brush and lamp black:

"Cut-price Sale Auto Supplies
1/4 to 1/3 off Everything
Except .....
Reason: Going to take inventory
—want stock as low as possible."

There were about 20 different things displayed in the window and each bore a hand-made price tag with the "original" and discount price. When a caller got inside he found everything tagged with prices in plain figures. On every hand he saw things he needed at attractive prices. He went in to buy one or two things and came out with half a dozen.

People told their friends about it. By the end of the week there was comparatively little stock left outside lamps, chains, and a quantity of standard supplies that caused no worry. One feature of the sale that proved intensely interesting was that in spite of the fact that there was no cut on certain trademarked goods, like Twitchell gauges, etc., the demand for these at regular price proved steady—and more of them were sold than had been handed over the counter in six months before.

The proprietors were careful to treat every customer with the utmost courtesy—and they explained carefully the contracts they were under not to cut the price of certain goods—and in every case the explanation was accepted without a murmur. The sale lasted in all two weeks. It meant much to the concern, for it opened a new line of customers and turned stock into cash at a time when money was needed. They are planning to repeat the idea next July.

PROOF THAT IT IS POSSIBLE TO MAKE NOVEL TIRE DISPLAYS

The Detroit branch of the Firestone Tire & Rubber Co. evidently has come to the conclusion that there is an opportunity for a tire store to have a window display that is not a pile of tires or three tires placed in triangular fashion. Heretofore that has seemed to be the limit for a tire display anywhere and everywhere.

This Firestone new window display consists of a tube—ground to pieces by driving on a flat tire. It shows the results as nothing else could show it. Next to it is a card reading: "This tube was driven four miles on a flat casing. Next time you are in trouble 'phone Firestone."

Tire Wisdom and What Comes of It.

The opportunity for teaching tire wisdom by means of carefully planned window displays is a big one. So far it has apparently been overlooked. The practical idea worked out by the Firestone branch suggests a variety of displays such as a casing and blow-out, showing how the big blow-out developed from a small cut that was not attended to; another one showing the effect of unequalized brakes or oval brake drums on tire casings; a display showing the effect of running tires with wheels not properly lined up, and so on down the whole list of tire trouble causes and effects.

A display has to be just a little bit out of the ordinary to attract attention. Anyone who noted the large number of persons who paused and looked at the practical Firestone display would appreciate the fact that passers-by notice the slightest change in window trtimming—and the secret of getting attention is "change."

EFFECT OF THE TIME-WORN "JUST OUT OF IT" EXCUSE

There is one garage in the Middle West that is perennially and perpetually "out of" something. One week it is cylinder oil; another time it is transmission oil; again it is gasolene. It is a pretentious garage, too—one that sells a fine line of cars and has a handsome display window. But its customers cannot fail to notice this strange "just out of it" condition that usually prevails, and the comments created are far from favorable.

Frankly, it is not good business. It is disappointing to go again and again and find that the staple article wanted is not available. Perhaps you like the man and you will be loyal to him for a long time, but sooner or later you will decide that it doesn't pay to bother going to Blank's Garage—"more than likely he won't have it, anyway."

There is a screw loose in the stockkeeping system. All his oils and greases are purchased in town from a wholesaler. It is so handy that he neglects to keep track of how fast they go. Thus time and time again he has to disappoint customers and offer an apology instead of selling goods.

Have any of the readers of this department a simple, practical stockkeeping system? If you have worked out something that does the work, send it ito the Wide-Awake Merchandising Department of the Motor World.

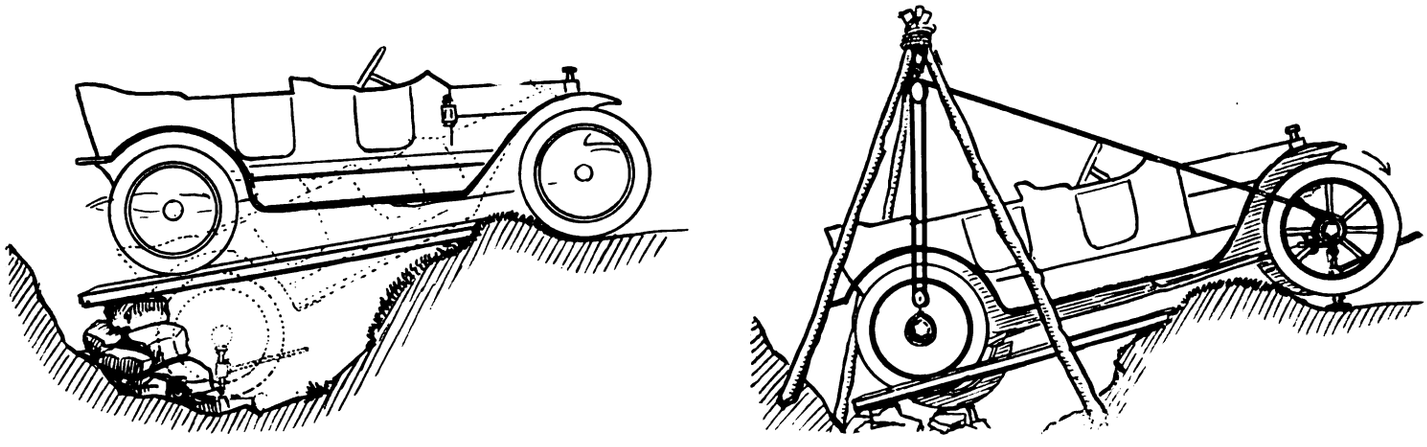
TWO WAYS OF RENDERING FIRST AID TO THE DITCHED

How to Haul Out a Helpless Car with Simple Appliances—Effective Combination of Block and Tackle, Jack and Rocks.

One of man's favorite occupations is building unto himself machines that are far bigger and more powerful than he is, and, by dint of the ascendancy of mind over matter, making these great engines do his bidding in various ways—such, for instance, as carrying him around the country faster than he could run, had he even a thousand legs. Occasionally, however, something happens to one of his monsters. Perchance it may fall into a hole or go backwards into a ditch, so that despite all the cunningly contrived doodads in its belly it cannot wriggle out, even with its master—man—on the job.

And right here is where mind has an excellent opportunity to demonstrate its mastery over matter—only the matter must be of a certain sort, or it will not do what it is told. If, through some miserable mishap, a car has landed with its rear wheels in a deep ditch and it cannot be dragged out by main force in the shape of a couple of teams of horses, either of the methods shown in the accompanying illustrations may be adopted—or, at least, tried. It is better to try something that maybe won't work than to sit and look at the car and say bad words about things in general.



If there are a couple of good, heavy planks available, a good supply of big rocks and a jack in the toolbox, it may be possible to bring the car up to a position so nearly horizontal that the motor, if it is in working order, can pull the car out. It is a case of little by little. The first step is to jack up each rear wheel and work in the planks, making sure that the "shore ends," so to speak, are well bedded on the bank. All the height gained by the lifting of the jack should be saved—or, at least, as much of it as possible—by placing stones under the boards.

The planks must be jacked up one at a time and a little at a time and the process repeated over and over, each time the stone packing being increased. There are several things to be remembered in doing this work. One is that in all probability it will be impossible to lift more than one wheel at a time, unless the jack is far more powerful than the usual "regular equipment" jack, or else the car extremely light, for owing to its tilted position the lift would be vastly heavier than with the car in a horizontal position. Another is that the jack, with nothing under it, probably would bury itself in the ground before consenting to shove the car up; a flat rock or a piece of plank under the jack would act as a "snowshoe." Still another is that not a little art would be required to arrange a pile of straggling rocks so that they would afford a decently firm support for the planks and the car—especially about the time the clutch was let in. Still, far greater obstacles than these have been overcome, and with the requisite jack, planks, pluck and perseverance a car can be worked out of an extremely awkward predicament.

If it is possible to augment the wrecking outfit by the addition of a set of shear-poles and a block and tackle, the work may be done with less trouble, less danger and more certainty of success. Good, big, husky shear-poles are necessary, and a good stout set of tackle, for, as has been said, the position of the car makes it necessary to handle a great deal of weight. The process may be practically the same as with the jack, except that the wheels are lifted from above by the hubs. Where the tackle is employed the jack plays another part altogether. The front wheels may be raised—one at a time—and the rope pased around the hub a couple of times, or, if the hub is not of a suitable shape, around a spoke, and the tire pulled around. In this way an enormous leverage is available, and the load could be held at any point by blocking the wheel, or by securing the rope so that it could not run down.

As to using the hubs as indicated, some care would be required, for though there are hubs that would be long enough for the purpose, they might not withstand the strain, and it might be better to hook the tackle onto the spokes of the wheels, or even the rims, though such a proceeding might be disastrous in its effect upon the mudguards.

It is not out of place to remark that there are occasions where the horse, whether emancipated or not, is a distinct blessing, and one such occasion is when a car is in a hole that it cannot pull itself out of. A good team intelligently handled, a couple of planks and strong hands to wield them, will do more in the rescue line in an hour than most any other system will do in a day. But if man's best friends are not within reach there is nothing for man to do but to befriend himself, and these suggestions may perhaps help some one to do so.

TWO WAYS OF RESCUING A DITCHED CAR; JACKING OUT AND HOISTING ON SHEARS

Making the Fan Generate Electricity.

The middle of a fan is of very little use in moving air, the inner sections of the blades serving as supports for the outer ends, which do the bulk of the real work. Therefore, in enlarging the hub of the fan and building into it an electric generator which is driven by the same belt that drives the fan the Kouyoumjian Electric & Mfg. Co., of Cleveland, Ohio, is, while detracting practically nothing from the efficiency of the fan, making an almost revolutionary departure. The Temco generator, as it is called, is designed for furnishing current for starting and lighting systems. It weighs but 10 pounds and is mounted on ball bearings. A factory for its production is now being erected in Cleveland.

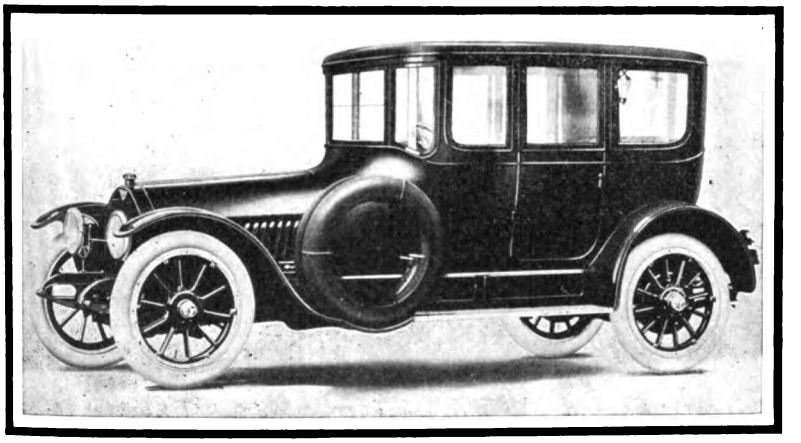
HUDSON LINE ONE "SIX" AND WITH LEFT SIDE STEER

Latest "54" Bigger and Better Looking than its Predecessors—Four-Cylinder Model Discontinued but "Little Six" Coming.

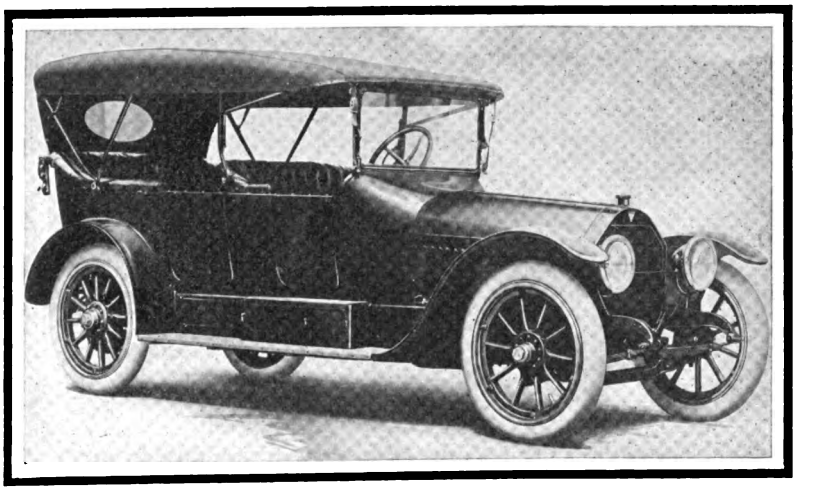
From the day it first came into the automobile world, a year ago, the Hudson "six" was anything but a small car. With its husky 54-horsepower motor and everything else in proportion, it was a good, big machine, despite its moderate price. Whether it was because the motor acted like a man doing a boy's work, or because the Hudson Motor Car Co., of Detroit, just came to the conclusion that popular feeling was in favor of a larger car, however, the latest Hudson "six," which still bears the designating number 54, is a distinctly bigger car than its predecessor, though the motor is unchanged except in detail and, stranger yet, the price has grown shorter as the wheelbase grew longer. The seven-passenger touring car, for instance, now lists at $2,250, as against the old price of $2,600. Speaking in terms of values instead of comparative money prices, there is a considerably greater difference, because not only is the new car a bigger one, but it is improved in a number of respects and its equipment is more complete.

As for the Hudson four-cylinder car, known as the "37," it apparently has served its purpose and has gone the way of all cars; that is to say, it has been discontinued, as stated in Motor World of June 26. But while the big "six" will be the "whole show" for a while, it will not be for very long, for the simple reason that in November it will be joined by a "little six" which now is in process of incubation.



The first thing to attract the eye in the latest Hudson "six" is its very considerable increase in length. From 127 inches the wheelbase has jumped to 135 inches—a difference of 8 inches—and it shows plainly in the machine. For a long car like this, a stiff frame is an absolute necessity, and therefore the frame channels are made 5 inches deep and 2 11/16 inches across the flanges; the material is pressed, heat-treated steel.

Probably the next change to make itself manifest to one familiar with the older car would be the change from right steer and control to left steer and center control. And not only has the gear lever changed its place, but that which it controls has been redesigned, for the gearset, which formerly provided for three speeds with direct drive on third or top speed, now gives four speeds, with direct drive on third, the fourth being an overstep for higher speed than is advisable under average give-and-take road conditions.



Not a little has been added to the attractiveness of the new "six" by a slight change in the shape of the hood. Where the hood lines were perfectly straight in the older models, they now have a slight though distinct forward inclination, the result being a slight tapering that is not only good to look at, but stamps the car as being right up to date in the matter of automobile body styles; for the gently tapering hood is quite the proper thing abroad and its real attractiveness just is beginning to appeal to the public on this side of the water. This type of hood outline lends itself particularly well to six-cylinder machines, with their long hoods, the taper very materially modifying the impression of length.

In the matter of fittings and equipment, as in the case of the car itself, whatever changes have been made have been dictated by a spirit of generosity, for nothing formerly supplied is lacking, while sundry items have been added and most of the things have been more or less bettered in some way or other. For instance, the motor driven horn, which formerly was listetd as an extra at an extra price, now is included in standard equipment. A folding steel trunk rack is permanently attached to the rear of the car. The tool kit has been made uncommonly comprehensive and is neatly packed in a canvas carrying case. The speedometer drive is taken from a gear, integral with the left front wheel spindle, and is concealed and encased. The cleanness of the car, as a whole, has been enhanced by the abolition of the side-lights, the big 12-inch parabolic headlights having a dimming attachment which makes them suitable for urban work and renders special side lamps an unnecessary equipment.

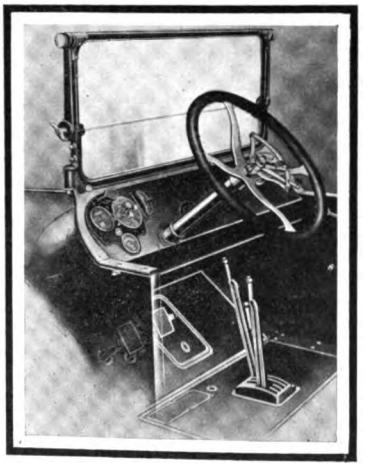
In the main the motor is unchanged. The cylinders are cast in two blocks of three; the bore is 4⅛ inches as against a long stroke of 5¼ inches. The crankshaft, which

HUDSON "SIX 54" SEDAN, SHOWING THE TAPERING HOOD

HUDSON SEVEN-PASSENGER TOURING CAR WITH 135-INCH WHEELBASE

Digitized by Google

is of special design and runs with very little vibration, has three bearings varying in diameter from 2 inches at the front to 2¼ inches at the rear or flywheel end bearing. Valves are of nickel steel, 2 inches greatest diameter, with 1¼ inches clear opening, and are actuated by a single camshaft. The timing gears are helically cut to ensure quiet running. Lubrication is effected by the usual pump circulating system, with constant level splash for cylinders and pistons. The Delco ignition system is employed, in connection with the Delco lighting and starting system, as in the past.



Enclosed in the flywheel, the clutch is made up of stamped steel disks with cork inserts; the disks are 11 inches in diameter. A bore cut in the end of the crankshaft serves as a housing for the clutch spring, the pressure of which is transmitted to the clutch drum through a ball thrust bearing. Small springs insure the proper separation of the disks when the clutch spring is released. The clutch runs in a mixture of half oil and half kerosene, which has been found to answer its purpose admirably.

The gearset, which is new, as already has been stated, in that it provides four speeds and has direct drive on third, is bolted up to the motor crankcase by means of a yoke which passes around the flywheel but does not enclose it. The short, stiff gear shafts run in roller bearings which are mounted in malleable iron cages, so that they are well secured against working loose and are quickly and easily removed in case of necessity. While all the gears and their bearings run constantly in oil, adequate provision has been made against the leakage of the lubricant. A good, big try-cock at the side of the gearcase provides a means of ascertaining the oil level, and a large filler opening on top permits the addition of lubricant when needed.

The full-floating rear axle is built with a pressed steel casing of stiff construction and is fitted throughout with roller bearings, including the driving pinion, which has two such bearings. Means are provided for determining the meshing of the pinion teeth with those of the large bevel gear, and also for making adjustment between the pinion and the gear in case such a step should be necessary. The brake drums on the rear wheels are 16 inches in diameter and 2¼ inches' face, and carry both brakes in the usual way, the foot or service brakes being the externals in the usual way, the foot or service brakes being the externals and the emergency brakes the internals.

Wheels are of the artillery type in regular equipment, though, as in the older car, wire wheels will be fitted at an extra cost. The wheels are fitted with 36 x 4½-inch tires on demountable rims, which take either clincher or straight side tires. The extra charge for wire wheels, which is $80, includes five wheels.

Long and flexible semi-elliptic springs are fitted in front and three-quarter elliptics in the rear. The front springs and the lower members of the rear springs are almost flat in order to eliminate as much as possible the jerky action of springs that are exceedingly curved. The front springs are 39 inches long and the rear springs 54 inches long. In assembling the leaves, which, incidentally, are tongued together to prevent lateral displacement, graphite grease is placed between the leaves to give easy action, and all the spring eyes are bronze bushed, fitted with hardened steel fitted

HUDSON "SIX" DASHBOARD

bolts and lubricated by means of grease cups.

A 19-inch walnut-rimmed wheel controls the worm-and-gear steering mechanism, which can be adjusted for wear by giving the full-circle gear a quarter turn and bringing a fresh section into mesh with the hardened steer worm. Soft grease is packed into the steering gear case, a dustproof grease cup on the top of the case permitting filling when necessary.

The gasolene tank is placed high up under the deep cowl, where it occupies space that is of no other use and affords a very good head of fuel for feeding to the carburetter. No matter how steep an ascent may be, the carburetter is sure to be well supplied with gasolene. Two partitions prevent the straining of the tank and the dash structure by swashing of the 21 gallons the tank will hold. A gauge shows at all times the quantity of fuel in the tank. A sediment cup is provided in the bottom of the tank, as well as a separator and a shut-off cock in the gasolene line.

Beginning with the Delco starting, lighting and ignition system, and ending with the ubiquitous tire-repair outfit, the equipment of the car leaves little to be desired and renders the machine really ready for the road. Anyone who cannot get along for some time, at least, with the regular equipment of the Hudson must be hard to please.

When a Car is a Two-Horse Wagon.

Automobiles have been classified as various things for various purposes, and now for peddlers' purposes, in Ohio, at least, an automobile is a two-horse wagon; it doesn't make any difference whether it's a one- or a 50-horsepower car, it's a two-horse wagon, according to the ruling of Attorney General Timothy S. Hogan.

In the statutes, the attorney found that peddlers going on foot must pay a license of $12 a year to the county; if he rides a horse or travels about in a one-horse wagon, he must pay $20; if he goes in a two-horse wagon, the fee is $28; if in a boat or railroad car, $60. But what if he goes in an automobile? There is not a word in the statute providing for peddlers with automobiles.

Mr. Hogan reasoned that as the statutes governing peddlers' license had been enacted before the advent of the automobile and as the automobile now is a general means of conveyance, the peddler should be allowed to use a machine, but that he should also pay a tax. He therefore decided that an automobile comes the nearest to being a two-horse wagon and that the peddler using automobiles should pay a license of $28.

Minnesota College Has Automobile Course.

To afford efficient instruction in automobile operation and repairing, the University of Minnesota, located in Minneapolis, has decided to offer a course in automobile instruction; this is designed to be more comprehensive than the instruction given in chauffeurs' schools and is divided into three grades. The amount of instruction is of three degrees in quantity, and the tuitions are $5, $7.50 and $10. Business courses, too, are being added.

Chicago Garagemen Hold a Picnic.

Five hundred persons attended an outing held last week at Cedar Lake by the Chicago Garage Owners' Association and the Chicago Section of the Electric Vehicle Association; the customary schedule of picnic sports afforded amusement and $1,000 in prizes was given. The affair was managed by Homer E. Niesz, Harry M. Fowler and George H. Jones.

Smoothing Up an Old Steering Wheel.

An old wood-rimmed wheel occasionally becomes so rough as to be galling to bare hands. An application of coarse sandpaper followed by a fine grade, is the remedy.

SMOKE—AND THE SALES THAT MIGHT HAVE BEEN

The Sales Manager Discovers Reilly's "Snipe Morgue" and Learns the Dealer's Views on Making Smoking Offensive—The Cigarette Smoker and the Gum Chewer, Too, Are Not Overlooked.

That a man is never too old to learn something and that he can be of inestimable value to himself if he will but recognize the fact that a great many people can do a great many things better than he can was a favorite doctrine with the Sales Manager—and Reilly, too, for that matter—and the Sales Manager often remarked that nearly every time he encountered his busiest dealer he discovered something he hadn't known before; sometimes it was a twist in selling cars and sometimes it was something new about Reilly himself.

Sales Manager Receives Mental Shock.

On this particular day, when he ran down to Reilly's salesrooms he didn't have in mind the discovery of anything new or startling, but he hadn't been there long before he received one of the greatest shocks he had received in some time; he didn't know whether to laugh or gasp in astonishment.

It happened just as a stranger appeared in the salesroom door and Reilly started to meet him. Reilly had progressed about seven-eighths of an inch on a beautiful specimen of the cigarmaker's craft and, as he rose from his chair, he lifted the cover of a little box on his desk, put his cigar in the box, dropped the cover and hurried out of the office.

Preventive of "Dead Cigar" Odors.

Reilly heard the Sales Manager's "What the——," but the remainder was lost to the dealer, who by that time had met the stranger in the center of the salesroom floor. The Sales Manager stared through the glass office windows at the dealer, shifted his gaze to the box and alternated thus for several seconds. Then he walked to Reilly's desk and cautiously opened the box.

"Well, what do you know about that?" And he slowly shook his head in hopelessness at the humorous wonderfulness of Reilly's invention. What he saw was an ordinary cigar box, covered with a coat of black paint on the outside, while the interior contained a little metal dish in which reposed the cigar with a slight line of smoke curling upward. Everything else was perfectly regular, except that the cover had been made to fit tight and on its under side carried a slug of iron which, when the cover was down, held it tightly in place.

The Sales Manager was still muttering to himself, "Crazy! Crazy, sure as you're a foot high!" when Reilly came back. Reilly tried not to smile as he opened the box, took out the cigar and, it not having entirely expired, puffed it back to full and vigorous life. To the Sales Manager he said nothing—just looked.

REILLY HEARD THE SALES MANAGER'S "WHAT THE ——!" BUT LOST THE REST

"Reilly," began the factory man reprovingly, "you're thirty-five if you're a day, but, tell me, honestly, are you getting childish? What's that—that—thing?" And he pointed an incriminating finger at the box.

"Snipe morgue," said Reilly.

"Snipe morgue, hey! Well, you're hopeless. I guess we'd better get a sane dealer before our business here runs down and out."

"The dealer chuckled, and Nellie, in her little office adjoining, watched out of the tail of her eye and smiled.

Reilly Gives Explanation of Device.

"What's the idea, anyway?" asked the Sales Manager.

"Cheer up, Jim, it's only here on trial; maybe I won't keep it," said Reilly.

"What's it for?"

"It'll explain," began Reilly, with a gesture toward the box. "You are sitting here smoking a good cigar. A man appears in the door. You don't want to walk up to him puffing a cigar, neither do you want to throw it away; if you leave it around and it dies the odor is something awful. What to do then? The box is the answer. You put the cigar in the box where it's out of the way and shut up tight and it bothers no one. When you come back you light up again—and there you are!"

"Some idea, that; the idea isn't so bad, but the darned thing looks funny. I never saw one before."

Offensive Smoking Heavy Handicap.

"Neither did I," rejoined Reilly, "but it seems to work all right. Mind you," he added with emphasis, "I'm not advertising this thing. It looks so freakish that I'd hesitate to tell my friends I have it."

"Well, it wouldn't do some salesmen any harm if they got a few hints on this smoking business," replied the Sales Manager.

"That's no lie; making smoking offensive to other people is one of the handicaps of too many salesmen. I certainly like to smoke and I've always tried not to offend people with my smoking, and this box is the finishing touch. I used to throw my half-smoked cigars away and the box idea is partly to save them. Why, do you know, the good cigars I've thrown away was one of the leaks in my business.

Troubles Which Reilly Encountered.

"I know that many people object to smoke, and if I've left a snipe around and they stay longer than I thought they would, or if they get into the office when I thought they would stay in the salesroom, it makes me nervous; I'm watching every minute to see if they aren't sniffing around to see where that snipe is. I felt pompous years ago when I started in business and thought it was the sign of a business man to smoke, even when I was talking to customers, even——"

"That's foolishness!" interrupted the Sales Manager.

"I know it is—now; but it took me several months to learn it. I will never forget how I learned my lesson. I had been selling cars for at least a year, and if I had been as observant then on the question as I am now. I suppose I would have tum-

Digitized by Google

bled before I was rudely pushed. But one day I had a man and his wife on the salesroom floor and all the time I was talking with them I hung on to my cigar. Occasionally I put it in my mouth. I never noticed that the woman fanned the smoke away from her face once in a while and that she moved around to get where it wouldn't drift her way, and even when she said she didn't feel well and would have to go home, I didn't realize what was the matter."

"How did you find out?"

Where a Cigar Postponed Good Sale.

"Well, the next day her husband wrote me a letter and told me. He said they had every intention of buying a car and probably would have done so if his wife had had the physical fortitude to stand my cigar until he got around to sign a contract, but that they since had decided to postpone buying for a time. I could have dropped through the floor, I felt that cheap and insignificant. I tried to land him after that, but never got him to the point where I had him that day. It seems that, while he smokes, the smoke makes his wife sick and when he smokes at home he does it in his den or where it won't annoy his wife.

"After that I used to lay the cigar down in the office when I saw anyone come in, but sometimes that wasn't satisfactory. If a man came into the office to sign a contract or for anything else, the cigar generally had died by that time and smelled as loud as 'dead ones' usually smell. So next I began to throw them away when I saw anyone coming in, and have been doing so ever since until now. Hang it, Jim," said Reilly, turning to look at the box, "I believe this is a great scheme, after all."

Prospect Entitled to Consideration.

"It certainly is better than what you will encounter in many of the salesrooms in town," supplemented the sales official. "You can't be too considerate of your prospects; a little thing like that is quite enough to kill a sale, provided the prospect is of a type to be offended by smoke. There are men who would turn around and walk out if you went out on the floor to meet them with a cigar in your hand, while cigarettes are so offensive to so many people that any man who carries one around a salesroom deserves to lose his job, even if he doesn't.

"Whenever I go into another man's office I always drop my cigar. I went to a doctor's office one day, not to sell him anything, either, and I forgot to drop my smoke. After I got into the waiting room I couldn't find a place to drop it and, seeing that there was but one other person there and he a man I hung onto it. But before I got to the private office to see the 'doc' three women came in and when I went out the doctor asked me not to close the door. I don't think that visit did me a bit of good."

"It's different if you know the man you're talking to," asserted the dealer. "When you come in I know it's all right to smoke, and there are lots of my customers who don't notice whether I'm smoking or not; they generally are themselves. But when a man appears whom I don't know and he isn't making a cloud himself, I keep on the safe side. And if it's a woman, I always—well, at present I use the snipe morgue.

"I know salesmen right here in town who will walk out onto the salesroom floor to meet a woman and keep a cigarette in operation at the same time. I know one well-known woman here in town who had quite an experience one spring trying to

"I REFUSE TO HAVE IT THROWN AWAY. I PAID FOR IT," SAID NELLIE

buy a car, and she said a thing that impressed her much was the lack of consideration smoking salesmen seemed to have for other people. She doesn't mind smoke, but she does detest cigarettes, and I guess she was mad enough to have punched one would-be salesman who smoked a cigarette and never even tipped his hat when she went into his salesroom. Moreover, he kept it on all the time he was talking to her.

Arraigns the "Smelly" Cigarette.

"She said she could have survived his keeping his hat on, for oftentimes a man may think interior weather conditions justify wearing a lid in the house, but she said that the ordinary breed of Turkish cigarette is too much for her."

"The cigarette is almost as bad as going around with your breath smelling like a gin mill," suggested the Sales Manager.

"I don't know but it's worse," replied Reilly.

"I suppose it all depends on how you look at it, but a man who can't weather a working day without a drink is sadly lacking in something or other," answered the manager of sales. "It makes me so darned disgusted, to meet one of our salesmen, or any other salesman, or any business man during business hours, for that matter, and get that unmistakable whiff every time he gets near me. I don't mind a drink, myself, now and then, but I do try to avoid such things during business hours."

Meck's Practice With Drinking Men.

"The practice which is followed by Tom Meck is good," added Reilly. "He's one of the best mixers I know of, and he gets along in fine style with everyone, drinkers, non-drinkers and everyone else. He always finds some way to slip in a glass of mineral water when everyone else is drinking highballs and he stands just as well, too. No man thinks the less of another man if he declines a drink, especially when the man who declines is known to be donig so with good reason. Meck's favorite explanation is that he has to see someone in a short time and that he wants to be sure to make a good impression. Generally he's telling the truth, too, when he says it, for he's always just going to see somebody."

"Also, deliver me from the gum-chewer!" exclaimed the Sales Manager, throwing up both hands. "Salesmen who condescend to refrain from smoking often go the limit in the other direction and try to talk car with a mouth full of gum. They can't enunciate distinctly and I'd like to know who wants to converse with a man whose lower jaw is flopping up and down and clicking away between words. I suppose gum chewing is all right in this day and generation, but it gets me."

"Snipe Morgue" Is Discarded—Almost.

"That, like many other things, is all right in its place; but that isn't on the salesroom floor," replied Reilly. "And say, Jim," he added, "I'm going to throw this freak box away. Everybody'll think I'm bugs."

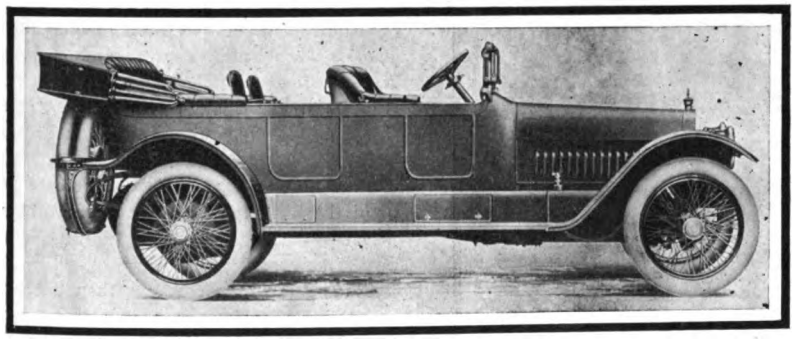
"No, they won't; keep it," urged the factory man.

"I refuse to have it thrown away; didn't I pay for it?" said Nellie, who walked in and laid a pile of letters on Reilly's desk.

"How's that?" asked the Sales Manager.

Reilly smiled sheepishly as she explained: "He left a dead cigar on the desk the other day, and it got so bad I threw it away and left ten cents in its place. He took the ten cents and bought the box."

"Ah, hah! A woman in the case!" exclaimed the Sales Manager.



"Yes—Cherchez la femme—always," was Reilly's meditative response. "Which, according to Hoyle, means, 'Hunt the dame,' when all other explanations fail."

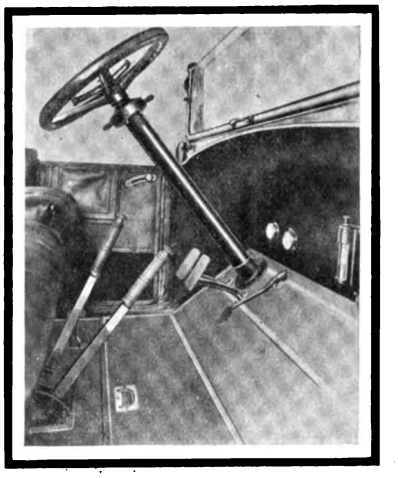
LEFT SIDE STEERING ON LATEST STEARNS-KNIGHTS

Center Control Goes with it—Slight Changes in Body Lines do not Affect Individuality, but Add Considerably to Beauty.

There is an indefinable something in the appearance of a car of well-established design that invariably stamps it as the product of its maker, regardless of such minor changes as may be wrought from time to time either to keep abreast of the popular conception of what a car should look like or to help in forming that conception. Just as a man has an individuality of appearance that is independent of his features and shows through changes in his garb, so a car designed by a strong mind has an individuality that survives modifications in body form and is independent of distinctive radiator or hood outlines. And so it is that the latest series of Stearns-Knight cars, the details of which just have been made known by the F. B. Stearns Co., of Cleveland, Ohio, shows the familiar Stearns earmarks, though there have been made some changes that were considered advisable from the dual standpoint of beauty and utility.

STEARNS-KNIGHT SEVEN-PASSENGER "SIX" WITH WIRE WHEELS



First to catch the casual eye is the change in the shape of the hood and cowl, and the significant shifting of the steering wheel from the right to the left side with the natural accompaniment of centrally placed control levers. The former parallel lines of the hood have given way to a slight but distinct and most becoming taper which merges easily into the flare of the cowl, eliminating the angle that heretofore has existed between hood and dashboard. Slight though the change is, it has a curiously marked effect on the car as a whole, giving to it an appearance of unity and of clean, unbroken lines that was not possible with the older angular interruption. The cowl is a trifle less conspicuous than it was and is decidedly pleasing to the eye from any angle of view.

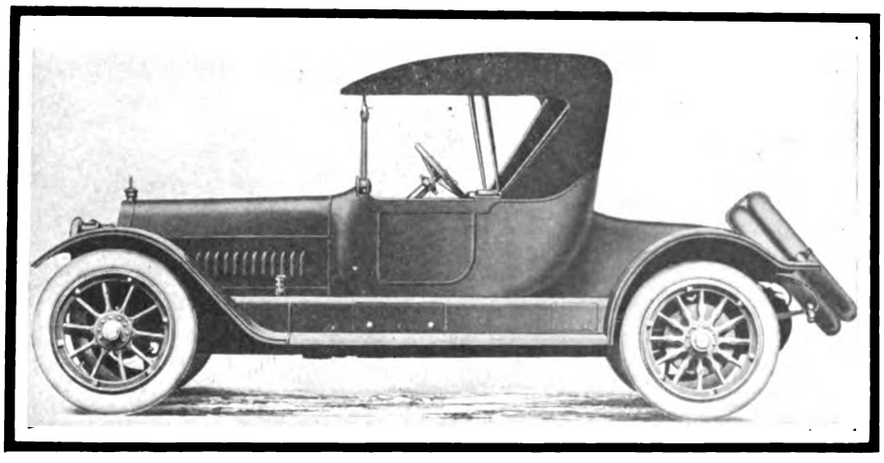
The change to left steer is a natural and easy one, and in making it the Stearns company finds itself with many distinguished confreres. At the same time, there has been an improvement in the arrangement of the spark and throttle levers which, formerly placed in the conventional position on the top of the steering wheel, have been relocated under the wheel and now are each but an inch long. The neat little casing which encloses the lever connections also accommodates the pull-and-push buttons controlling the electric lights. The ignition switch, carburetter adjustment and electric horn button also are carried on the steering wheel column, thus centralizing the most needed controls. The electric motor starter is operated by a pedal.

As in preceding models, the six-cylinder chassis has a four-speed gearset and the four-cylinder chassis three speeds, both selectively operated. The larger car retains the unit power plant system, and while the smaller maintains the separation of the engine and the gearset, the latter has been moved from its former position on the rear axle to a point near the middle of the car. In neither case is the Stearns rear axle construction changed, the solid forged casing of enormous strength and stiffness being continued. In the construction of this axle casing the huge forging is split in the middle to accommodate the driving bevels and the differential, while the arms are bored through for the passage of the driving shafts.

Changes of less conspicuousness, but still of importance in their own ways, include the placing of the tool boxes under the body, with hinged covers just over the running boards and below the front seats; the adoption of folding seats of the arm-chair type for auxiliaries in all seven-passenger models; the substitution of pantasote for silk mohair as a top material and the adoption of a quickly and easily operated style of top; the optional fitting of wire wheels, at a slight extra cost; and the elimination of the bulb horn in favor of the motor-driven signal.

In the sleeve-valve motors practically no changes have been found advisable. The four-cylinder motor has the same bore and stroke—4¼ x 5½ inches—and the "six" also retains its cylinder measurements of 4¼ x 5¾ inches. While the nominal rating of the two motors is given as 28.9 and 43.3 horsepower for the "four" and "six," respectively, the makers state that these figures are merely nominal and that the motors can be guaranteed to exceed them by 50 per cent. The lubrication system is of the movable trough type; the troughs into which the connecting rod ends dip at each revolution are connected with the throttle lever, so that the amount of oil splashed is increased and decreased with increases and decreases of motor speed. The multiple jet carburetter for the four-cylinder motor and the expanding type for the "six" are practically unchanged, as is also the dual ignition system with a single set of plugs and high-tension magneto that is common to both.

STEARNS-KNIGHT CONTROL



While but two chassis models are built, as in the preceding series, each chassis is made in two wheelbase lengths, which virtually expands the line to four chassis models. The six-cylinder model wheelbase lengths are 134 and 140 inches, and those of the four-cylinder model 121 and 127 inches. The 116-inch wheelbase for the "four" has been discontinued. Each chassis may be had fitted as three-passenger roadster, four-, five-, six- or seven-passenger touring car, limousine, landaulet, coupe or sedan—a truly imposing category of body types. The coupe and sedan are newly designed throughout, and were not previously listed by the Stearns company, while the other models are developments of previous types. There will be no difficulty in agreeing with the manufacturers that the line is an un-

Digitized by Google

usually comprehensive one, including machines adapted to practically any class of service, whether urban, suburban or cross-country.

The provision made for the comfort of passengers is ample and effective. The spring system includes semi-elliptics in front and three-quarter elliptics in the rear, with rubber bumpers. It goes without saying that tires are large. In the four-cylinder models they are 36 x 4½, except in the seven-passenger models and the heavy closed cars, in which they are 37 x 5 in the rear and 36 x 4½ front. In the "sixes" all tires are 37 x 5.

Always believing in the extreme of completeness in equipment, the Stearns people have adhered to their principle and have even gone a little further than in the past. Regular equipment includes electric lighting and starting system, the illuminating

STEARNS-KNIGHT SIX-CYLINDER THREE-PASSENGER ROADSTER

department covering head lights, side lights, tail light, dash lamps, auxiliary trouble lamp and tonneau light in the five- and seven-passenger models and, of course, interior lights in the closed cars; top, side curtains, slip cover, built-in windshield, speedometer, electric motor horn, two extra quick-detachable rims, tire carriers, auxiliary gasolene tank, ventilator door hooks and the usual tools, etc., in the new tool boxes. In addition, the enclosed cars have speaking tube, dome light, clock, toilet set, card case, notebook, flower vase, etc., and of course all models have the regular equipment of robe rails, footrests and the like.

Light Cars and Loose Nuts and Bolts.

A fact that owners of lights cars should bear in mind—and act upon—is that in a light machine vibration is more effective in loosening nuts, bolts, screws and so on than in a heavy car. This means, of course, that such things should be given no opportunity to get loose, but should be well taken care of with lock washers, split-pins and other trouble preventers.

TIME—THE ASSET WHICH IS MOST VALUABLE POSSESSION

Without it All Other Capital Avails Nothing—Big Corporation Advises its Salesmen to Conserve it Most Studiously.

"If time was money I'd be a millionaire," the ragtime "fans" used to sing; they were quite right, and the principal difference between the ragtime singer and the average millionaire is that the latter turned his time into money while the "ragger" didn't. But each had just as much time as the other, not one whit more or less.

Time is every man's capital, or, at least, is one of his greatest assets; in fact, it is his one greatest asset, for if he had no time all the money capital he might have would be of no avail. Also, time is an asset which is wasted more than probably any other, and the value of this fleeting commodity is emphasized by the National Cash Register Co. in a talk to its salesmen.

"Your greatest asset is time. Everything else is furnished you. Opportunities, goods, advertising, and cooperation cost you nothing. They are free," is the opening of the admonition. "But time is what you buy and pay for. It is the stuff that turns opportunities, goods, advertising and cooperation into money.

"Seconds, minutes and hours of the working day mean dollars to you. You can reap the full valuation, or you can throw away your time and dollars. The result is success or failure. Good days and bad days are merely flights of your imagination. Every day is a good day if you make it so. Every day is a bad day if you dissipate your time.

"Some wise man said: 'Each day is a life.' Days are measured by time. Your life and your success are measured by the use you make of your time. Another wise man said: 'Another day, another life.' Each day is your day. To-day may be your biggest day—who knows—but you? Make the most of it. Arise each morning and be glad to join the others who know and understand the value of time.

"Now is the only time you can. Yesterday is past. We live only in to-days.

"Nothing wastes time like miscalculation. It is the parent of incompletenes and the great author of lost sales and poor business. Calculate your time carefully. Do not let your victories of yesterday make you feel too sure of to-day. Instead, let them be a stepping stone to new heights of efficiency.

"Every hour you waste causes a certain amount of money to leak out of your pocket. Every time you slow down you choke your income. Think of the wasted time between the completion of some sales and the bringing of a new prospect. Think of the time wasted in getting started some months. Think of the money these time wastes represent.

"Time is the most valuable thing in the world. Every minute or every hour wasted can never be recalled. Two things, spent time and the spoken word, never return. Time speeds by, and unless it is used to advantage, it is lost forever.

"Make use of your time. Increase your capital by taking advantage of your greatest asset—time."

Racing the Motor Worse than Useless.

While there is reason in abundance for running a motor, without load, at reasonably high speed for the purpose of making carburetter adjustments and the like, there is no excuse for "opening her up wide" and letting "her" turn up to the last limit of speed. Under no conceivable practical conditions could the motor run in such a way in service, and there is little sense in forcing a motor to do things that are absolutely useless, merely for the purpose of making a fearful noise—which is the most obvious result. Further, excessive racing must be productive of a certain amount of wear and tear and no small unnecessary strain due to the tremendous centrifugal force exerted by the rotating parts, and it is to the interest of the car to avoid whatever is unnecessary of this sort. Tuning a carburetter so that it will carry the motor at 3,000 revolutions per minute when it can't pull the car when running over 1,700 revolutions is nothing short of foolishness, though it often goes to the extent of being a nuisance.

To Make Thick Oil Flow Freely.

Oil that is rather thick can be made to run freely into narrow crevices by putting the oil-can on the exhaust pipe and thoroughly heating it. Cylinder oil thins when heated less than most other oils.

THE ROAD MAN THE WEAKEST LINK IN THE CHAIN

Wherein His Work Differs From Traveling Salesmen in Other Fields—Golden Opportunities That Are Wasted—His Weaknesses and Specific Remedies That He Himself Can Apply.

By GEORGE M. DICKSON, General Manager National Motor Vehicle Co.

Older lines of business grew to their positions through the use of the man on the road. The automobile business jumped to its magnitude, due to its unique conditions, without the aid of the road man. Now to hold its position and magnitude, the automobile business begins to grow systematic and the road man takes his place as a part of this selling system.

Road Man Is a Sort of Salesman.

As a result, the automobile road man is a kind of travelling salesman, and his work offers a golden opportunity. His methods and his possibilities are as yet imperfect.

Let us take the dry goods business and see what we have; there have been men on the road for years and years in the dry goods business. They have inherited the principles, methods and policies of the men before them. They can measure their results by experience. They have regular routes, as their places of business are practically all established and are known quantities. The men to whom they sell their goods have for the most part been in business for years and years, and these buyers know how and when to buy.

Not so with the conditions that surround the automobile road man. There is but little experience to mark the way. The motor car man-on-the-road must create new business, besides calling upon the trade that is trying to become staple day by day.

Duties Which Fall to the Road Man.

The man who buys of the automobile road man has not been taught how to buy like the dry goods dealer. The automobile road man has not such defined routes, and not such regular customers as the dry goods travelling man.

While the purpose of both the automobile and the dry goods road man is to represent his factory in the "field," the work of the two men is different, due to these conditions roughly outlined. The automobile road man calls upon new customers continually; the personnel of the automobile business has been changing rapidly. The automobile road man must hunt out and establish new dealers, while it is often true that the dry goods road man must hustle to call upon regular customers in his allotted time.

The automobile road man's duties briefly and generally stated, consist of calling upon present customers; creating new dealers; helping the new and old dealers sell cars; studying the conditions in the "field" and keeping the factory advised; assisting the dealers to perfect their service- systems; listening to complaints of both dealers and private owners and helping to remedy faults; "drumming up" prospects for the dealers; helping the dealer to close sales; and in general be a traveling miniature sales force of the factory.

Own Resources Essential to Advance.

The road man to do his best work should imagine that he has his desk in the factory offices and not get into the habit of thinking that he is a thing apart from the home office. The initiative and creative possibilities of the road man's position depends largely upon his own resources and sense of obligation. There are few road men with such opportunities to "soldier" on the job as the automobile road men have, if they do not care about the future.

Automobile road men, many of them, have been associated at one time with large garages or dealers, or branch houses in cities. As a result, they hesitate to leave the large towns. The fertile field today is in the small towns, away from the easy hotel chairs and bright lights of the cities. The dry goods road man makes every small town; the automobile road man must make every small town henceforth.

Must Win Prestige for and by Himself.

I believe that the average automobile dealer is well educated how to get customers, how to sell them, and how to take care of them after they buy. I believe that automobile factories have learned the lesson of building what the people want, at the price they want it. I believe that the public is educated how to buy—how to judge a motor car, what to expect of it, and how to take care of it. The man who is behind the times in this whole scheme of builder, dealer and consumer is the road man.

This is not altogether his fault. He has been put into a peculiar position. He must to a large degree work out his own salvatiton and win for himself and his fraternity the respect and confidence of both builders and dealers. If the road man is to be a permanent, important, trusted and high-salaried factor in the business of selling automobiles he must win such prestige for himself; he must acquire by producing results the position in the trade that makes him indispensable.

Suggestions for Road Man and Dealer.

I have had road men write to me from the "field" telling me of their experiences, defeats, successes, ideas for improvement and suggestions that are constructive. From these reports from road men, and the observations of the force at the home factory, I have made the following suggestions that are calculated to help all road men and the dealer as well:

1. The road man, in order to make headway, may make promises he cannot keep. This, one of our road men writes me, is what he has observed has been a fatal mistake of some of his competitors. The road man's promises misrepresent either the actual intrinsic worth of the car he sells, or misrepresent the extent of the co-operative service the factory will render. This permits the road man to make an immediate "showing" back at the home office, but it acts as a boomerang in the long run and does more harm than good.

Price Cutting Not Real Salesmanship.

2. It is not "selling" cars to give one dealer a greater percent off than is given other dealers. Sometimes a road man may write his home office that if they will only let him give this man a little larger percent discount than the regular prescribed rate, he could close with the dealer. That is not salesmanship. That is only giving something away, and you can give things away by the use of a two-cent stamp, without putting a man on the road at considerable expense who got his job because he claimed to be a salesman.

3. Here is a little thing, but I have often seen it prove important. The road man gets into a town loaded with a list of names of people who have sent the factory in-

Digitized by Google

quiries. The factory has no dealer in this town. The road man, if he can create interest in his car among the people who have made inquiries, and if he can sell one or two to these people, he could with ease establish a dealer. The dealer wants to be "shown" that there is a demand in his town for the road man's car. But if this road man takes his list of names and goes to the telephone booth in the hotel and merely calls them up—his answer will be the same and he ought to save his time. He should go and see every person who has sent in an inquiry; talk to that person face to face.

Belittlement of Certain Inquiries.

Unfortunately the road man sometimes belittles such inquiries. Naturally so, when he has taken no interest other than giving the telephone girl a number. Salesmen who can sell automobiles by telephone in a minute's conversation have not yet become a reality, and it is not likely that they ever will.

4. Every locality may differ. The road man must first make an analysis of his locality. Many things can combine to make this or that locality different. The success of some one make of car, or the failure of this or that dealer to play fair with the public, or the temperament of the people, or—well, there are a thousand things that the 100 per cent. good road man will study and not take by faith. For example, in Texas, in a certain territory, a road man wanted to get a certain wealthy man to own a car. If he could sell this man he felt that this man's word, his recommendation, and his example, would influence other sales.

But this certain wealthy man had refused to "fall for" the regular line of salesmanship talk the road man had used in Eastern cities. The road man then retreated and "readjusted his weapons for a different attack." The road man dared the certain wealthy man to go to the factory, many miles away, and drive a car home. If the car, after the trip home, had made good on all the road man's claims, then the certain wealthy man was to buy it. If it did not make good for itself, then the road man was loser.

Selling a Purchaser His Way.

The certain wealthy man was built that way; the proposition made a hit with him — appealed to his fresh-air-sporting make-up. He accepted. He was skeptical. He rode in the car home, and bought it, converted, happy and boosting. His influence will produce easy sales for this road man in the future. The Texas man "was sold" in his own way. That's the point—sell a man **his** way, not **your** way. Make the man think **he** is buying it from you, and not **you** selling it to him.

5. A road man, I believe, should be well posted on all the latest developments, activities, and all things, be they commercial, mechanical, or political, pertaining to the motor car industry and, in fact, to the whole country. The road man should be a constant reader of newspapers and automobile trade papers. He must keep posted, as in the automobile business as nowhere else is the business beginning a new era every day.

Road Man Should Help Dealers.

6. A road man should strive to be a constructive help to the dealer already in business, to aid him in perfecting his selling system; his follow-up system; and his garage service system. The road man could be of great help, because of his accumulated ideas and broad experience. This will help not only the road man, dealer and the factory, but will be a practical benefit to the private owners as a whole.

7. The road man should be so well posted that it would be impossible for a prospect to ask a question that the road man could not answer and tell the whole truth. Often a prospect will ask what seems to be a perfectly foolish and unimportant question. But how often have you noticed that if you are courteous and complete in your answers to the many little questions by so doing you win the prospect's confidence and respect and are able later to prove your big point.

8. The road man should convince the dealers that he was born, trained, put to work and paid for the one and only purpose of being of real, tangible assistance to the dealers.

Advertisements Should Be Studied.

9. The road man should study advertising. He should read every advertisement that comes from his home office and should help to educate the dealers to read and practice advertising. The road man should watch the advertising of competitors, too. It might save him embarrassment, and certainly will add to his general knowledge. To ignore advertisements is either to admit that you are inefficient or that you think you are "too wise" to need to heed the trend of the times. Advertisements are the windows through which you see what is going on inside the industry to a very large degree.

10. The road man can be of great help to his factory back home, by keeping the employer fully advised as to changing conditions.

11. The road man should study his competitors' dealers, and report their success or failures to the home office, in order to keep tabs on the movements of "the enemy."

12. It is useless to add: Don't knock; boost always, work hard, and keep clean habits.

I believe that the road man problem is rapidly working out its own solution, but certainly here is one angle of the selling system that can be improved—and the road men themselves are the ones who can best improve it.

Yawning Opportunities for Salesmen.

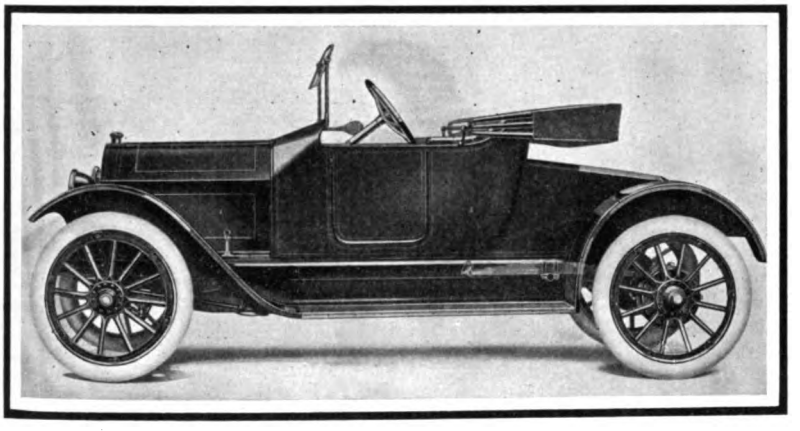
"If I only had the opportunity," is the lament of many a salesman, dealer or garageman who probably waits for opportunity to knock at his front door, never dreaming that he might sneak out the back door and find her skulking around in the back yard. That too few men know opportunity when it appears is the statement made by the National Cash Register Co. in a talk to its salesmen.

"The trouble is, you don't know Opportunity by sight. You are expecting her to soar down from some mysterious perch and place a purring chance in your lap," it says. "You are letting your fatalism get the better of your common sense. You are standing on a rock in a fresh-water lake and waiting for 'the tide in the affairs of men.'

"Opportunity is a tangible, ever-present thing. It is many things. It comes to you at your office in your morning's mail. It is personified, perhaps, in the man who is sitting on the bench outside your door. It beckons to you from the farm, stalks at your side as you ply your trade, winks up at you from the whirring wheels of your factory machines. It is at your elbow and under your thumb, in your home and a thousand miles away.

Things That Suggest Opportunities.

"The conversation at your dinner table to-night may suggest a chance that you can take. Your Sunday afternoon walk may disclose an opening for which you have been waiting all these years. The business appointment you have to-morrow morning may hold for you more than you now believe. That article you just read might turn your life from failure to success. That advertisement you just passed by may be the keystone in some other man's triumphal arch.



"Opportunity comes in strange guises, at strange times. It seeks and is sought. It may be close at hand; possibly a distance away. Where it is depends on you—upon your bump of introspection and perception. Of one thing you may be sure—there is a chance open somewhere that you can take—but you will have to know Opportunity by sight before you can expect to spill salt on its tail."

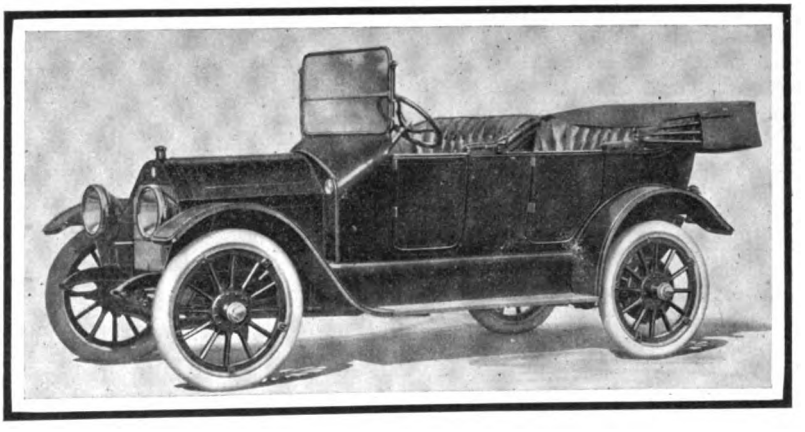
MORE KICK IN KING MOTOR AND BETTER DETAIL WORK

Higher Compression and Bigger Bore Factors in Power Increase—Motors Now Built "at Home"—Spring System Unchanged.

The time to make changes and improvements in cars—that is, provided the changes and improvements are worth while—is just as soon as possible, regardless of such considerations as those concerning yearly models and the like. If a new idea is a good idea, it cannot be incorporated in the car any too soon. At least, this is the point of view of an ever increasing number of manufacturers, and it is the point of view of the King Motor Car Co., of Detroit, which hereafter will make changes and improvements just when they are required, regardless of seasons or times.

KING ROADSTER, SHOWING CANTILEVER REAR SPRING

It would appear, however, from the specifications of the very latest thing in Kings that there is not much danger of that machine becoming unrecognizable for some time to come through alterations, for having found out most of the things they wanted to know about the best way to build their own particular car, the King people are going ahead and building it accordingly, with changes so slight that only an expert in Kings would be able to detect the variations without assisance. A little more power, a little change in the design of the engine, and an increase in the efficiency of the cooling system that is a little more than commensurate with the increase in horsepower—barring these things the machine stands as it stood in the models that preceded the latest, which is designated as Model B.



The increase in the power of the motor has been brought about by the increase of the bore from 3¾ inches to 3⅞ inches, the stroke remaining at 5 inches, and by raising the compression approximately 15 pounds. Instead of being cast in pairs, the cylinders now are cast en bloc. The motor now is built wholly in the King factory, with the exception of making the castings, the plant equipment having been augmented to permit this additional work to be done at home, so to speak.

The motor is combined with the gearset to form a unit power plant which is carried on a three-point suspension, the single point, as usual, being at the front. Cooling is by thermo-siphon system, a six-bladed fan of particularly careful design serving to maintain a good blast of air. By increasing the capacity of the water system as a whole—making both jackets and pipes of more ample dimensions than formerly—the cooling effect is increased, the movement of the water rendered easier and the filling intervals made longer.

The motor is of the L-head type, with valve stems and springs enclosed; rollers on the valve lifters ensure long life and minimize friction at these points. Lubrication is by constant level dam system, which takes care of the cylinders and pistons by splash, and by forced feed to the three main bearings, there being the usual small rotary pump to maintain the requisite circulation of the lubricant. A dual ignition system is employed, with a single set of plugs, a Briggs magneto taking care of the generation of current when running.

A 12-plate multiple disk clutch, running in oil, the disks being faced with Raybestos, serves as the connecting link between the motor and the gearset. The gears provide three speeds, selectively controlled by a centrally placed lever; the steering wheel is on the left side. The gear shafts are mounted on roller bearings. The propeller shaft runs through a heavy torque tube and has the usual universal joint at the gearbox end; the necessity for radius rods is eliminated by the tube and the distinctive cantilever springs, which take the drive from the rear wheels. The rear axle is of the full-floating type and is of substantial construction, having 1½-inch driving shafts and other parts in proportion; the axle is fitted with Hyatt roller bearings. Considering the fact that the car is of moderate size, the brakes are of ample capacity, the drums being 14 inches in diameter and the bands 2¼ inches wide; both service and emergency brakes are on the same drums, the arrangement being the usual internal expanding and external contracting construction.

The springing system is the especial pride of the King company, and in this there is no change. The rear springs have received the lion's share of attention, for obvious reasons. As is quite well known, they are of the so-called cantilever type, a single semi-elliptic spring on each side being pivoted at its forward end and the middle on the frame of the car, while the rear end is clipped to the rear axle casing. Road shocks are transmitted to these springs at right angles to their length, the result being a shock-absorbing, easy-riding effect that is as agreeably effective as the system

KING MODEL B FIVE-PASSENGER TOURING CAR

Digitized by Google

is simple. The front springs are semi-elliptics placed directly under the frame members, to which they are shackled in the usual way.

But one chassis model is built, having a wheelbase of 112 inches, tread of either 56 or 60 inches and 33-inch wheels with 4-inch tires on demountable rims. Two body styles are mounted—a five-passenger touring car and a roadster. The general effect is that of long, straight lines, and the design is noticeably clean. The cowl, which carries the windshield without unsightly stay-rods or other steadying parts that detract from appearance, is carried slightly backward at the top, forming an extra overhang that not only looks well but brings the windshield well to the rear and adds somewhat to the protection of the occupants of the front seat.

Not a little of the credit for placing a surprisingly roomy five-passenger body on a 112-inch wheelbase is due to the rear spring system; it is the claim of the King people that the term "roomy" is applied to their car with all correctness. Both touring and roadster bodies are finished in dark blue, with metal trimmings either nickeled and polished or finished in black, so that there is not an excessive display of glitter. The rear of the roadster body forms a large compartment for carrying "duffle."

The price of the car with standard equipment is, as before, $1,095. Standard equipment includes electric lights, windshield, top with cover and quick detachable side curtains, the customary list of tools, tire repair appliances, etc., tire irons, an extra rim, speedometer and electric horn, the two latter items being additions to former equipment lists. As extra equipment at an extra cost, the Ward Leonard electric starting and lighting system is installed, which brings the price to $1,195.

Prest-O-Lite Denies "Canned Gas Fuel."

Although within the past week the Prest-O-Lite Co., of Indianapolis, has been accredited with being about to market "canned gas" as a fuel for automobile engines, the company, in answer to Motor World's inquiry, states that it has "no definite plans at present regarding acetylene or other gas for fuel." Whether "definite" means that the project has been scarcely thought of or has been given more serious consideration is not apparent. It is not new in automobile circles that gas, even illuminating gas, can be "canned" and used as fuel, but thus far the idea has not been developed to a point of practicability, though numerous experiments, many of them giving promise of large possibilities for the future, have been made with various manufactured and natural gases.

"KNOW WHY YOU FAIL—THEN WIN," ADVICE OF SALESMAN

Man Who Retrieved a Failure Tells How he Did it — First Learned Why he Had not Succeeded, Then Sought the Remedy.

Many a man has failed in something he undertook and has remained a failure without knowing why it was he did not succeed, whereas had he made an analysis of the situation there is a possibility that he might have learned the reason for his failure and, knowing it, have supplemented his failure by success; this applies to automobile salesmanship as well as to any other vocation or business, and one instance of a salesman who failed is cited by a man who now is successful in the car selling field in Cleveland, Ohio.

"Three years ago I started selling automobiles," he said, "and I probably was the biggest failure who ever broke into the business. I had been selling buggies for something like fifteen years and had been one of the best salesmen in the employ of the company—at least, I had headed the list in point of gross sales for the last five years of that time. So when the buggy began to take a rear seat in favor of the automobile and I saw other fellows making small fortunes in commissions in the new field I promptly decided that I would enter it.

"My previous record as a salesman made it easy for me to make a desirable connection, and soon I was on the pay roll of a large automobile sales concern at a fine salary and with a chance to make as much more on commissions if I produced the business. In a few weeks, however, I could see that a nice indigo envelope would be awaiting me at the office if I didn't begin to make sales.

"I had had a bunch of prospects on the string, and in many cases had hunted them down myself; but not in one single instance had I succeeded in closing a sale. Only two of the 15 or more prospects had eventually decided in favor of our car, and these had to be turned over to one of our other men before they were ready to buy.

"Something had to be done in a hurry. I had no idea of going back to selling buggies and acknowledging that I was a failure in the new line. So I set about to find the reason for my failure and likewise the remedy.

"Finally I hit upon it. I had been in the buggy field for a long time, and knew buggies from A to Z. I knew how they were made, and what they were made of, and what they should be made of to insure satisfactory service. I knew all the other makes with which we had to compete, and could point out the comparative excellencies of our brand.

"All I knew about automobiles was the little I had been able to pick up from the advertisements our firm was running and from listening to the sales talk of our star salesman. Of course, that was all one sided, and I had learned it without knowing exactly what it means. I had a certain little spiel that I used on every prospect, and it abounded in technicalities of which my knowledge ended when I pronounced them correctly. I said carburetter, for instance, and talked of mixtures without knowing anything more of a carburetter than where it was located.

"I resigned from my position and started in to learn something of the practical side. I took a short course in a garage, under the eye of one of the best mechanical men in the city, and during this time I thought nothing about brands at all. When I had learned to take an automobile apart and put it together again, and had a practical knowledge of the workings of every part of the mechanism, I could see even more plainly than at first the reason for my first failure. I now had ideas about what an automobile ought to be and what it ought to do, and I could give them to an outsider with clearness. I felt competent to advise in regard to what sort of a car would give the greatest satisfaction.

"When I had completed my practical course I went to several of the leading car agencies and let them try to sell me one of their cars. In this way I had a chance to notice their selling talks and to see just what other cars had to offer. Remember, I was a practical automobile man now and they could not put anythnig over on me. After this tour I made another discovery—the most startling of them all—and that was that I didn't want to tie up with the firm with which I had started out originally, for I found out that other cars had it beaten.

"It always had been part of my selling creed that it was necessary to have supreme faith in your goods, or you couldn't sell them; so I proceeded to make a decision as to which was the best all around car in the price range most sought for, and then set out to get the agency for it. I had no trouble in doing this, as I was able to demonstrate my ability, and at last I had a start in automobile selling on even terms with the most capable salesmen in the business.

"Sales were comparatively easy after that. I knew what I was talking about, and I had confidence in my article—two things that I now know are indispensable to selling success."

GARAGE AS SUCCESSOR TO THE VILLAGE SMITHY

How an Enterprising Young Garageman of Central New York Draws Good Living From Transient Trade—Is a Car Dealer as Well—Methods That Differ Slightly From City Practice But Are Successful.

Under a spreading chestnut tree
The village smithy stands;
The Smith can stand in the door and see
The passing of trade that used to be,
And he wishes he'd given up the darned business a couple of years before and built a garage before "that young feller" started one down the street and got all the business.

When Longfellow eulogized the village blacksmith he probably never suspected that his workaday hero would some day be relegated to a back seat while the center of things mechanical in the country village located itself under the sign "Garage," where a wide-awake young mechanic drew the dollars which the transient trade used to leave with the man of brawn and grimy hands. But such is the case. The old blacksmith shop was well capable of taking care of the troubles of the passing trade and the village trade as well when horse-drawn vehicles were the style, but with the coming of gasolene wagons the smith has been obliged either to become a garageman or to find himself deprived of much business that might otherwise be his.

Village Garage Much Like the Smithy.

To-day, throughout the country, the village garage is just as much a village institution as the old smithy used to be and where the "kids" used to "rubber" in through the door at the flying sparks, they now hang around where they can smell gasolene and get free air to blow up their bicycle tires. Furthermore, the reliable and honest village garageman is making a better living than the blacksmith ever expected to make.

There are many garages of this type; especially is the State with good roads prolific in them. When in Central New York a Motor World man asked a motorist who drives much who was a live country garageman, and the motorist, after a moment of thought, said, "Go to see Newton, in Chittenango," and the advice was followed. To get there the Motor World man traveled 11 miles on a third-rail electric road and rode two miles and a half in an automobile 'bus to the little village of less than 1,000 inhabitants and with no near railroad connection. But it lies on the old Genesee turnpike, an east-and-west State road across New York, and is in a valley which furnishes some of Central New York's most beautiful scenery.

Floyd H. Newton, who operates one of the two garages in the village, is an excellent sample of what a garageman can do in a country village, and his business is conducted with an acumen which might well serve to pull many a big city garage from a profitless rut. Newton is a dealer, as well, and is filling the Chittenango Valley with Fords.

Started Business With Few Assets.

Less than two years ago his principal asset was an unlimited amount of nerve, common sense and a one-cylinder, 2½-horsepower gasolene motor. He got married. Then he borrowed $900, took his gasolene motor under one arm and his bride on the other and set up in business. For this he rented what in successive stages had been a saloon and grocery store in the center of the village, on the State road. The motor he set up in the store barn and since then has added, piece by piece, a drill press, lathe, air compressor, emery wheels and a small dynamo, this constituting the repair-shop equipment. Much in contrast with city conditions, the whole rent is but $15 a month.

Part of the borrowed capital went for furniture, and he proceeded to start housekeeping in the rooms above his store. The remainder went to buy a Ford demonstrator and a few other things, and he opened for business where his predecessors had dispensed booze and groceries. The main or front part of the store is his showroom and contains his stock of accessories and supplies. The rear of the building houses a work bench and vulcanizing equipment.

Getting a Hold on Transient Trade.

A year ago Newton, who is only about 25 years old, was a sub-dealer under the Ford representatives in Syracuse, but this year he is a dealer on his own account. The change apparently has had much to do with his success. Last spring he contracted for 20 Fords, even though the factory hesitated about allowing him so many, but he made good on his contract and to date has sold about 25. A couple of thousand dollars profit isn't so bad for a country dealer, especially when it's not the only profit.

When Newton opened up he realized that his future lay largely in getting a hold on the transient trade, for on Sundays and holidays when the weather is pleasant about 500 cars pass his place between 7 o'clock in the morning and midnight, not counting numerous motorcycles, and many of this number stop and leave from 25 cents up.

To let the public know he was there, Newton erected four signs, four feet square, at various advantageous spots about Chittenango informing the public that he offered "prompt service and right prices." Once the trade began to come he took care of it, and it came back. Many times he has been called 10 and 12 miles out into the country to repair a breakdown, and his reputation is now so well established that those who frequent his locality do not hesitate to call upon him for fear they will get "stung."

A practice he followed at the beginning is still in effect, and that is being reasonable in charges. If all that is required is a carburetter adjustment that requires but a few minutes, he is quite likely to make no charge, and if it is a nut or bolt or some little thing of that description, his charge, when he does charge, seldom falls below 25 cents. Hardly a motorist but is willing to pay a quarter or a half-dollar for a small job, and these small amounts count big on a busy day.

Free Air an Effective Drawing Card.

Realizing the advertising that lies in free air, Newton installed a small tank on wheels, with a hose, in front of the store, and anyone whose tires need inflating is welcome to take all he wants. As an example of the garageman's business and mechanical ability, when he installed his free air wagon, instead of spending a bunch of money for it he bought the various parts, picked them up here and there or had them made, and built the wagon himself. It is about three feet long, a foot and a half in diameter, and holds 150 pounds. He is going to paint a "free air" sign on the wagon, "but," he said, "I don't need to do that, for any man who drives a car can spot that tank as far as he can see it." It always stands in the street in front of his place of business, and even the village

Digitized by Google

boys draw on it for filling up their bicycle tires.

Gasolene is an able source of profit. Under the driveway at one side of the garage is a tank which holds 10 barrels—about 500 gallons; and a pipe extends from this to a Wayne pump inside the building near the front door. From the pump a section of gas pipe extends out of the building and across the sidewalk, with a hose running down to the street. Gasolene is bought at 18 cents and retailed at 22 cents, which means 4 cents for Newton every time he winds up the pump crank. During the past June he wound it up 1,800 times, a profit of $72, and much more than he could earn by much harder labor of some other kind. His oil average is about 100 gallons a month. The expeditious delivery by pump and hose, instead of by pail and funnel, is a trade getter. Newton said he hesitated to buy the outfit, but never has had any reason to regret it.

Keeps Small Stock of Many Things.

The establishment is given an appearance of enterprise by its electric "Garage" sign; it is the only electric sign in Chittenango. Current is supplied by the little dynamo in the barn-shop, and the same source of supply lights the house and other buildings. There is but one other electrically lighted building in the whole village.

Next to the garage is the Dixon House, the village hotel, which is by no means a disadvantage, so far as location is concerned.

The stock of supplies is quite inclusive and is carried in a manner which requires the use of as small an amount of capital as is possible; instead of stocking up with a large quantity of the same article, Newton carries a small number and has many articles. Every week, or oftener if necessary, he runs in to Syracuse and replenishes his wares. Patches, tire repair materials, grease cups, nuts, bolts, and every sort of supply which is likely to be called for by the transient or village motorist is stocked, "and," said Newton, "they raise just as big a holler if I haven't got what they want as they would in a city garage. The trade has come to expect they can get everything they want here, and I try to live up to their expectations."

Making the Most of the Trade Instinct.

Also, there is the stock of Ford parts; the company requires him to carry $200 worth, and it has been found sufficient for his needs. He has about 75 Ford owners in his territory to care for and many more pass the door. He has no set rule for service to his owners, but uses his judgment as to what shall be done, and only in cases where the owner is naturally unreasonable has he experienced any material trouble in making satisfactory adjustments.

In the sale of cars Newton makes it a rule never to have more than two or three used cars in stock; if he has three and a man wants to trade in another, the dealer informs the prospect that it is impossible for him to do it, and even if he loses a sale he stands not to lose money in a used car stock. When the Motor World man called on Newton a Ford mechanic was there remedying trouble in the doors of a couple of cars which had in some manner not been quite properly fitted before shipment, and the Ford man was asked if Newton ever did much trading. The mechanic's idea of Newton's business ability was summed up in "He'd take a dog in trade." And another man who knows Newton supplemented this by the statement, "And he'd trade the dog and make money on him."

Newton himself laughs as he tells how some years ago he bought a dilapidated bicycle, traded several times until he got a new bicycle, traded it for an old motorcycle, kept trading until he got a new motorcycle, and then traded for an old car, thus providing the germ of his idea that he wanted to get into the automobile business. He never worked a day in a blacksmith shop or machine-shop, he said, but the Ford expert said, "They can't put anything over on him in the mechanical line."

Feminine Influence in the Business.

He is naturally a mechanic, and so is his wife. When he first started in business, being just married, of course his wife liked to go to the shop to talk to him, and it wasn't long before she was taking hold with the work for the pure enjoyment of it, and now she is capable of doing many things with a car. She can drive skilfully, adjust a carburetter and do almost anything that doesn't require hard manual labor. His working force consists of one man besides himself. Newton, although the Motor World man didn't know it until he had talked with him several minutes, is an admirer of Motor World and states that he has found much that is helpful to him in its Wide-Awake Merchandising Department and other stories. Mrs. Newton is no less interested.

Unlike many country garagemen, Newton believes firmly in advertising. He has frequently combined with the Ford dealers in Syracuse and other towns surrounding that city in a substantial space in Syracuse papers which called attention to the whole group; his territory includes the cillage of Canastota, a nearby village of between 3,000 and 4,000 inhabitants, and he uses the columns of the village papers to call attention to his business.

During the year he sells better than an average of a car a week. "I have sold two in one day," he remarked. "A man can surprise himself sometimes by what he can do if he gets a taste of blood."

Germany to Encourage Burning of Benzol.

Germany, which always evinces a keen interest in the solution of problems of a scientific character, has shown an appreciation of the automobile fuel situation by taking steps to promote the development of carburetters capable of vaporizing benzol as well as gasolene. A competition for benzol carburetters will be organized by the Prussian ministry of war, and four cash prizes offered, the amounts being $2,500, $1,250, $750 and $500, respectively, for the best four devices tested.

The competition will be held some time in December next, and is open to inventors of any nationality, it being stipulated, however, that in case a competitor from a foreign country wins a prize he must make arrangements for the manufacture of his carburetter in Germany. Both road and laboratory tests will be made, and different designs of the same device may be submitted for pleasure and commercial purposes. The points that will be considered will be those which naturally are of importance in such a device—simplicity and durability, economy and effectiveness in the use of fuel, noiselessness,, facility of starting in cold weather, range of action and adjustability for use with either benzol or gasolene. The fuel will be ordinary commercial benzol having a specific gravity of .88. Entries will be received up to November 1 by the Versuchs Abtheilung des Militar-Verkehrswesen, 2, Siegfriedstrasse Schoneberg, Berlin, while the entry fee of $125 for each carburetter will be received by the Kassen-Verwaltung at the same address.

What Shrinkage Will and Will Not Do.

There seems to be a rather prevalent idea that the heating and subsequent cooling of a piece of metal will cause its shrinkage—that is, that it will make the metal smaller than it was previous to heating. While it may be, perhaps, that there is a microscopic shrinkage as a result of heating and cooling, it is not sufficient to be detected by any ordinary means. The idea has its origin in the fact that heated metal expands and, upon cooling, returns to its original size. Thus, a metal ring, when heated, will slip over a shaft that would be too large were the ring cold, and upon cooling will contract and grip the shaft with a tremendous pressure. But if the ring is too large in the first place, heating and cooling will not make it fit the shaft any better, though not a few seem to be possessed of the idea that this will be the result, and many disappointments have resulted from the error.

"INDIANA MADE" TOURISTS REACH THE "GOLDEN GATE"

Now on Last Leg of Journey to Los Angeles — Giant Redwood Tree and Rechristening of Pass to Commemorate Tour.

The "Made in Indiana" tourists have sighted the Pacific Ocean. The unimproved overland trail is past history and the "boosters" are now enjoying themselves on fairly good roads and under California's justly famed skies. The party reached the Golden Gate Monday, 28th inst., after a triumphal tour across the State from the Nevada line. Two hundred and sixty-two cars met the tourists outside of Oakland, and the Sunday quiet was badly disturbed in the crashing roar of welcoming horns.

Tuesday and Wednesday were spent in and about San Francisco, viewing, among other things, the grounds where 'Frisco is to hold its Panama-Pacific Exposition in 1915, and to-day the journey to Los Angeles, the ultimate goal, begins. The "boosters" are still boosting—even if Carl Fisher and ex-Mayor Bookwalter were temporarily incapacitated by a watermelon fest near Oakland—and the "natives" who have viewed the "Indiana-made" crowd and cars are not likely to forget soon that there is such a State.

For four thousand years—automobiles may be a thing far back in the race of progression and forgotten by then—the name of Carl G. Fisher, of Indianapolis, is destined to be handed down in California as the "big noise" in a band of "Indiana made" tourists who then may be regarded as having thought they did a big thing when they drove their cars from their State to the Pacific seaboard; his name is to be preserved on one of California's giant trees, a sequoia gigantea, which was planted by the residents of Big Pine last week, when the Indiana tourists reached the point where the Indiana Midland trail parts from the Los Angeles trail.

This tree should live 4,000 years unless something happens to it, and it is to be marked with a bronze plate suitably inscribed and enclosed in a bronze fence. Its name is the "Fisher Sequoit," and several thousand years from now, when Indiana "boosters" are soaring to the Pacific in their flying machines, they may point downward to where a mammoth redwood rears its branches and say, "That's the Fisher tree. Fisher? He was the original Indiana booster—and some booster, too."

This was not the only pleasant incident in the journey to Los Angeles, where the tour will end Monday, 4th prox., for when the party passed over the divide between Lake Mono and Long Valley they found their coming had been anticipated with a metal tablet, naming the top of the pass "Indiana Summit," which name will be recognized by geographists.

The original schedule called for Los Angeles by August 2, but delays in the mountains before reaching Carson City, Nev., caused a setback of one day. Prior to that, in Casa Diable, which sounds as if it might mean "Devil's House," or something like it, the tourists nearly froze in their night camp. They crawled into a hay mow as a last resort, but even then they shivered, and the California morning sun was extremely welcome.

All along the way there have been enthusiastic greetings and, after a pleasant sightseeing trip along Lake Tahoe, across which the cars were ferried, a good share of the population of Sacramento turned out in welcome, and Wild West shows and other entertainment were injected nito the schedule. Sacramento was reached Saturday evening, 26th inst., and Stockton and Oakland were covered Sunday.

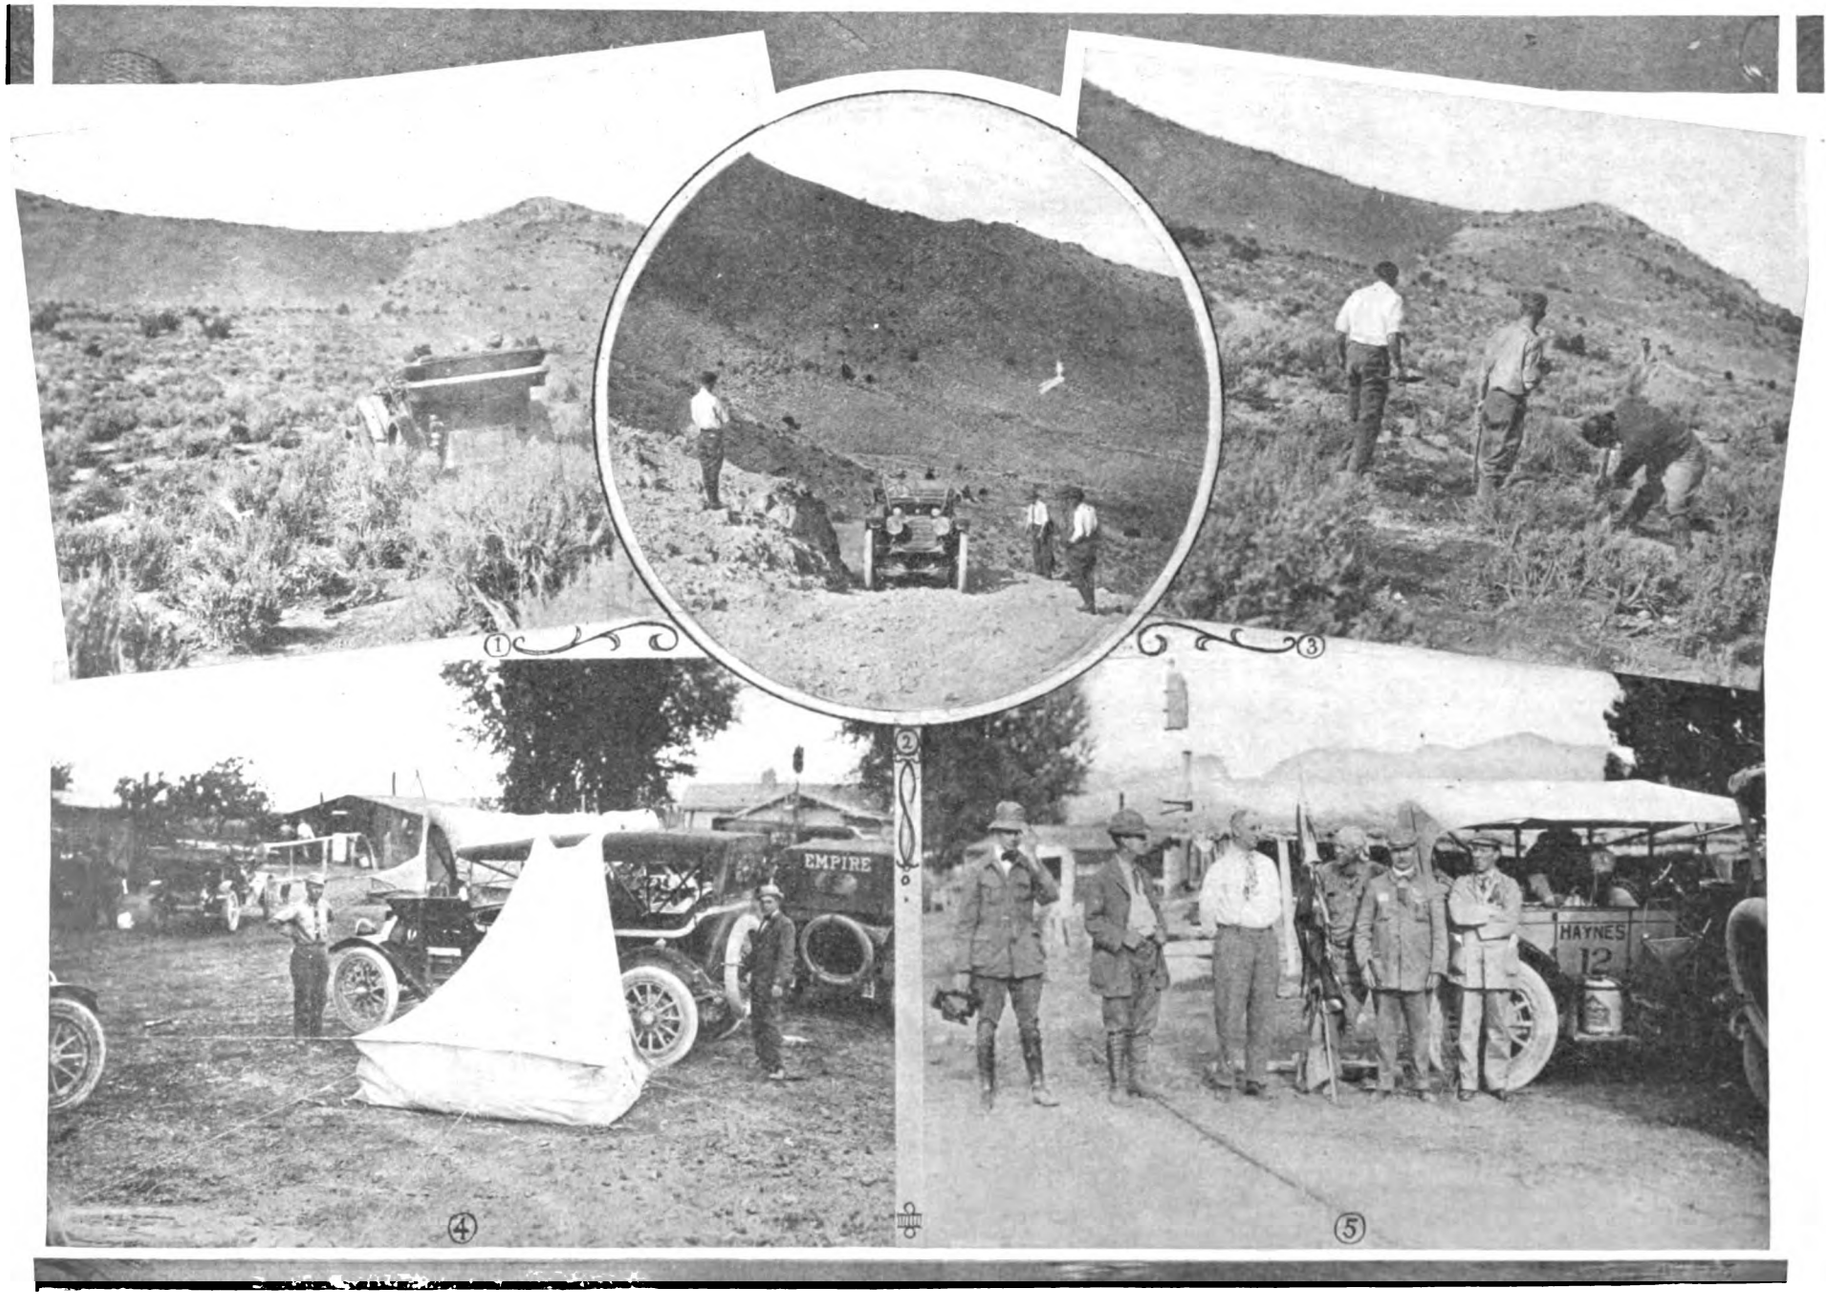
The welcomes along the route have been lent an official flavor. Governor Oddie of Nevada attached himself to the party in his State and remained a loyal follower until he could turn the strangers over to Governor Johnson of California across the Nevada-California line. Now and then a washed-out piece of road had to be reconstructed, and sage brush for miles wiped the mud and dust from the bottoms of the cars, but mishaps have been few.

The "boosters" have had little serious trouble and decline to regard night freezings and daytime roastings or rough roads as a mar to pleasure. Of course, the Premier truck was lost for two days in the Nevada desert, the crew running out of water and having to walk miles to get more, and the Pathfinder car was lost for the same length of time and had to drive nights to catch up, but those are regarded as mere incidentals by these trail blazers, who believe that when the speedometers total 3,539.4 in Los Angeles and they have given their final "boost" it will not have been in vain. Fisher, whose dream was the father of what may be a big coast-to-coast automobile road, has already dreamed still more and now sees a telephone system paralleling the route. The real trail blazing ended at the California-Nevada line, for the California roads are already built.

Catron Sets up "Closed Car" Record.

J. W. Catron has accomplished what he set out to do, and now has a new kind of a record to his credit; he is the first man to cross the American continent in a closed automobile, and he is justly proud of his record. Catron, who is a Los Angeles machinery contractor, left his home city together with his wife and a maid and his brother, to say nothing of lots of luggage, same 21 days ago in a Studebaker "35" Sedan and just has finished his trip at Rochester, N. Y., none the worse for the experience and particularly enthusiastic over the advantages of the closed car for transcontinental touring. So comfortable did the car prove on the long drive that he will tour down to New York City and in all likelihood will return to his home the same way. When the schedule first was laid down, Catron figured on making 103 miles a day, but he soon found that 125 miles could be covered without difficulty, and even this schedule was bettered for the best part of the distance.

Joy Ride Record—Makes 1,200 Miles.



Ralph Reynor, former chauffeur for Col. Willis Wood, of Kansas City, Mo., is 40 years old and should have known better, but this doesn't release him from answering a charge of having stolen his employer's car and established what probably is a record for "joy riding." He evidently had a good time while he was at it, for while he started from Kansas City, he traveled 1,200 miles in 12 days, winding up in Portsmouth, Va., with two women companions. In this "burg" the chief of police, F. T. Tynan, picked the car up on description and claimed the $500 reward. Before starting, Reynor, it is charged, had new tires, accessories and repairs charged to the Colonel and also bought 500 of the Colonel's favorite cigars on the same basis. He was trailed to the Kansas City city line, where the trail was lost. The car, a green Speedwell, was not difficult of apprehension if watch were kept for it.

Another Chauffeur Gets Fourteen Years.

A second 14-year sentence for killing a pedestrian with an automobile has been meted out in Chicago to a car driver; the chauffeur who was given this sentence last week is Fred Hrodek, 23 years old, of 4403 Madison street, who March 19 ran into and killed Patrick J. Condon, of 1236 West Harrison street, at West Madison street and Clark avenue, with a truck. There were several automobile men on the jury, but this fact, aside from causing considerable speculation, seemed to have no bearing on the consideration of the case and Hrodek was given 14 years in the penitentiary. His speed is said to have been 35 or 40 miles an hour. May 2, Lawrence Lindbloom, a chauffeur, was given a similar sentence for killing Joseph Weiss, a cigar manufacturer. Weiss was struck and dragged a considerable distance, and the manner of his fatal injury aroused public sentiment.

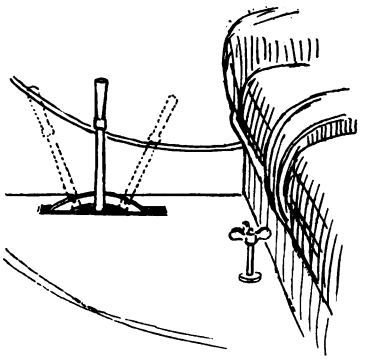
USING AIR IN PLACE OF THE STARTING CRANK

Some Systems That Convert Motors Into What Corresponds to the Steam Engine and How They Work—Reciprocating and Rotary Air Motors Used in Others—Eliminating the "Dead Center."

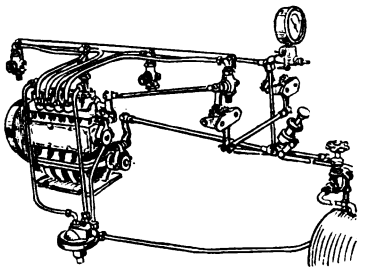
In the long roster of mechanical engine starters, part of which was published in Motor World last week, and in which five pneumatic devices were illustrated and described, no mention was made of what is known as the "piston pressure" starter, though this system probably is the simplest of them all; probably it was the first successful type of compressed air starter in use, and it has been used with excellent results by a number of manufacturers, prominent among whom are the makers of Winton cars, for a long term of years. Those who have used starters of the kind, however, have built them in their own shops or have had them built to measure, so to speak; comparatively few manufacturers produce devices of the kind, which accounts in a measure for the little that is known about them as compared with starters of other types.



AKRON COMPRESSOR-MOTOR SYSTEM INSTALLED

In action, they virtually convert the automobile motor for a time into what corresponds to a steam engine; instead of rotating the crankshaft in the usual way until a mixture of gasolene and air is drawn into the cylinders, compressed and fired by the ignition spark, thus starting the engine on its own cycle of operations, they apply the power directly to the top of one of the pistons and in this way rotate the crankshaft; thereafter their action is similar to the action of any other kind of a starter, except that there is only one moving part, unless a compressor is used, when there are two. In other words, the compressed air in the reservoir corresponds to the steam in the boiler of a steam engine, and when it is admitted behind the piston it forces the piston downward on the power stroke.

Similarly, like a steam engine, any four-cylinder automobile motor is likely to stop on "dead center," when the application of all the compressed air in the world would prove of no avail in starting it. Six-cylinder engines, however, cannot stop on dead center, as is pretty well known, and it is on engines of this kind that the piston pressure starter is most serviceable and most used. On a four-cylinder motor that has been in use for some time and that has had time to get its bearings smoothed down and is otherwise in good condition, the piston pressure starter can be expected to do good work, for a smoothly running engine that is free from all tendency to bind seldom will stop on dead center; generally two pistons will balance the other two, leaving one cylinder with the valves closed and ready to fire; but if it should stop on dead center nothing remains but to use the hand crank.

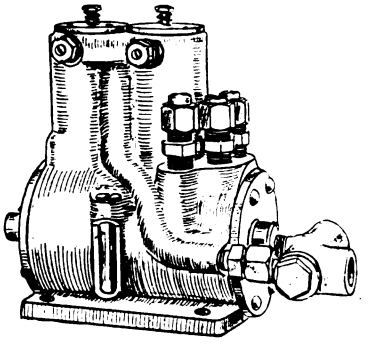


Among the very few manufacturers who exploit a device of this type, the Roth-Murphy Engine Starter Co., of Indianapolis, Ind., has developed a system that has a number of distinctive characteristics. Two systems are manufactured and they are widely different. In the first of them, air is compressed and stored in a reservoir by means of a diminutive two-cylinder air compressor and is distributed to the cylinders of the gasolene motor through a rotating disk valve that forms part of the compressor, as is shown by one of the accompanying pictures. The rotary disk valve is so timed that when the master air valve is opened the compressed air is forced into the cylinder in the firing position—the cylinder that has both its valves closed with the piston at the top of the stroke, in other words. In the care of this particular compressor and disk valve it is only necessary to keep the tiny crankcase of the compressor full of oil to the level indicated on the glass gauge on the side; replenishment probably will be necessary about once or twice a month, depending upon the amount the compressor is used.

ARBITER CONTROL LEVER

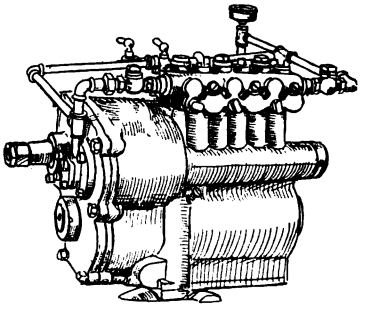
In the second type of Arbiter starter, as it is styled by the Roth-Murphy people, a three-cylinder combined air compressor and reciprocating air motor is used, and this is geared directly to the forward extension of the engine crankshaft. Obviously, with this type of starter the power is applied directly to the crankshaft, instead of through the cylinders; consequently there can be no failure through the engine coming to rest on dead center. The starter is operated by a small lever—it is shown by one of the accompanying pictures—running over a quadrant with three positions: forward, starting; central, which is the neutral position, and to the rear, which is the compressing position. So that no harm will come to the starter through a back kick from the engine, the drive is through a positive dental clutch which releases instantly the gasolene engine takes up its own cycle of operations. In this compressor-

Digitized by Google



LOMBARD SYSTEM COMPLETE

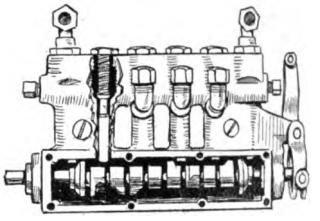
motor, too, lubrication is carried on entirely by splash and the only attention required is to fill the oil reservoir from time to time. Valves are so arranged that wear tends to make them seat better and therefore they never will require to be touched throughout the life of the starter. The appearance of the unit with its gearing all enclosed is shown by the accompanying sketch. Though the tank and line connections are constructed and tested for 500 pounds pressure, the normal pressure carried is approximately 200 pounds.



The Lombard starter, which is produced by the Clark Novelty Co., of Rochester, N. Y., is very unusual, in that it is designed effectually to overcome the possibility of failure of the starter through the engine to which it is attached coming to rest with the pistons on dead center. The essential elements of the system include a four-cylinder air compressor, a distributor, a pressure reducing valve, suitable check valves for the cylinder heads and an air storage reservoir.

In operation, depression of the master air valve control pedal permits compressed air to flow through the distributor, which is timed with the expansion strokes of the pistons, and causes the engine to run backward for part of a revolution or until one of the pistons is in the proper position to receive the charge of compressed air from the tank. To prevent the engine being turned backward too far, the air first is admitted through a pressure-reducing valve. The piston stopping in the right place is ensured by a cam cutting off the air, and also by the fact that the pressure used is lower than compression pressure. With the piston in the proper place, air under the full pressure in the tank automatically is admitted to the cylinders in their firing order until the motor takes up its own cycle of operations. The arrangement of the whole system is shown by the accompanying picture, which shows the combined pump and distributor. The pump normally is driven at crankshaft speed, and the distributor is timed with the valves.

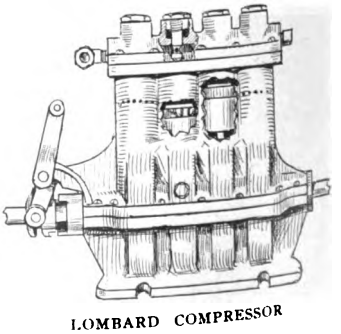
ARBITER AIR COMPRESSOR



In the care of this system there will be little to do except to see that the moving parts do not want for lubrication; another important feature is to make sure that looseness in the parts does not develop—particularly in the rods that lead from the dash control—for if it does it is likely to impair the efficiency of the starter by not causing the valves to open properly or to close properly. When leaving the car over night it is a wise precaution to close the shut-off valve and in this way ensure the retention of the charge of air in the reservoir.

SCHIMPF UNIT SYSTEM

In the Akron system, which is produced by the Motor Starting Co., of Akron, Ohio, and which is shown herewith as it is applied to a car, the operative functions are carried out in an entirely different manner; the system belongs in the class given over to those in which a small reciprocating air motor supplies the power necessary for the initial revolutions of the gasolene engine. The motor used in the Akron system, as is made plain by the picture, is a miniature three-cylinder machine which operates also as a compressor when it is driven by the gasolene engine; the method of connection is by means of a "silent" chain to the clutch shaft.



Incorporated with the motor-compressor there is a tiny change gearset which regulates the speed of the motor-compressor according to the function it is performing; thus, when it is operating as a motor its speed is higher than when it is operating as a compressor. The changes of gear are automatic, however, and are controlled by the device itself. When the dash button is pressed to start the motor, for instance, the air motor drives direct, and when the little clutch pedal is depressed the gears automatically come into use. Air is stored in a reservoir measuring 7 x 36 inches, carried at any convenient place beneath the chassis.

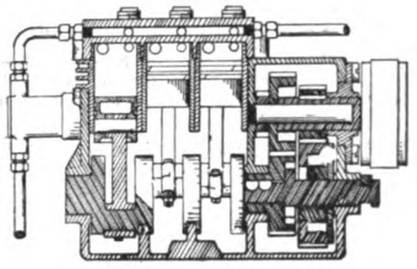
LOMBARD CAM DISTRIBUTER

With this system, as with the others, care means, briefly, lubrication of the moving parts and particularly the little combined motor and generator. From time to time the air connections should be gone over—this applies to all the air systems—and where necessary they should be tightened, for, regardless of how tight they may have been in the first place, vibration always is likely to loosen them after a time. Failure of the air pressure at a critical time has been the direct cause of more blame aimed at air starters than has anything else, though much of this trouble can be eliminated with reasonable care.

The Schimpf starter, which is manufactured by Walter H. Schimpf, of New York City, is an unusual device in a number of respects. It has a very ingenious combined compressor and motor, the functions of which automatically are controlled by the pressure of the air in the reservoir. In its simplest aspect, the Schimpf unit is a four-cylinder machine with the cylinders set V-fashion. The valves are ball checks contained in recesses near the heads of the cylinders, and when the unit is operating as a motor they are operated mechanically by means of tiny push rods and a miniature cam shaft. When the unit operates as a compressor, however, the valves are operated automatically. This change is brought about automatically by longitudinal move-

LOMBARD COMPRESSOR

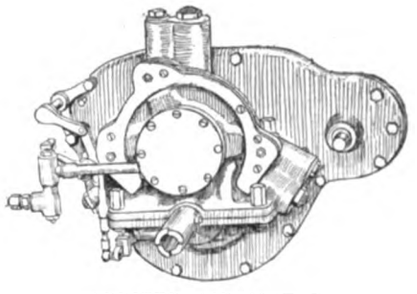
Digitized by Google



ment of the camshaft which operates the valves.

In the air line between the storage tank and the compressor-motor there is a cylinder and a plunger which is attached to and slides the camshaft longitudinally; the camshaft is held with the cams out of operation by means of a spring. Hence, when air under pressure is released to the line, the camshaft is moved longitudinally; this brings one of its cams under one of the push rods which opens one of the valves and permits the air access to the cylinder. The other cams operate successively and for the time being the unit operates as a plain air motor.

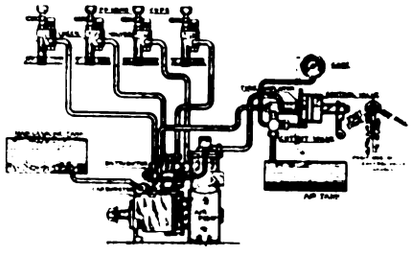
Instantly the air valve from the reservoir is closed, however, the spring pressure returns the camshaft to the normal position and the unit automatically becomes a compressor. In order to connect and disconnect the compressor, another cylinder and plunger, operating a simple dental clutch is employed. As soon as the pressure in the tank reaches 200 pounds the internal mechanism of the compressor remains idle; when it drops below that figure, the compressor automatically comes into action and remains running until the desired pressure is obtained. Between the motor-compressor unit and the gasolene engine there is a double two-to-one gear reduction operating through two roller clutches. Thus, when the unit operates as a compressor one clutch releases and overruns and the other permits the proper compressor speed; similarly, when the unit operates as a motor, the other clutch releases and gives the proper reduction for starting the engine. Final connection between the unit and the gasolene motor can be made in a number of different ways and is immaterial.



The Christensen starting system which is manufactured by the Christensen Engineering Co., of Milwaukee, Wis., does not belong truly in the class with other pneumatics, although it relies primarily upon air pressure for operation; it belongs more properly among the class of ignition starters, for it depends actually upon the explosion of a charge of gasolene and air in the cylinders to start the motor.

In its essential elements, it consists of a small single-cylinder air compressor that may be geared to the gasolene engine so as to operate at crankshaft speed, an air reservoir, a distributor valve, a small auxiliary carburetter connected to the main gasolene tank and the necessary check valves for the cylinders. In operation, air is compressed by the pump and released by a valve through the auxiliary carburetter and distributed to the cylinders in their firing order. The ignition spark previously having been turned on the compressed mixture within the cylinders explodes and thus starts the motor.

SCHIMPF UNIT DETAILS



One individuality of the Christensen system is that the compressor automatically is thrown into and out of operation by the pressure of the air itself. When the operating lever on the dash is turned to the right and the central button depressed, a passage from the compressor to the tank is opened and the compressor restores the pressure; when the lever is placed centrally, the compressor automatically is disengaged, but when the lever is moved very slowly from right to center the compressor remains in operation and tires may be inflated direct by attaching a hose to the control valve which opens to the atmosphere. When

ARBITER AIR MOTOR

the handle is turned to the left and the central button depressed air is permitted to flow from the tank through the auxiliary carburetter—it is entirely separate from the regular engine carburetter—to the cylinders through the distributor. Although the air pressure may cause the pistons to move, their movement is of short duration and the starting function proper is carried on by the explosion of the mixture within the cylinders.

In the care of the Christensen system, as with any other, lubrication of the compressor and of any other moving parts is of prime importance if satisfactory service and freedom from trouble is to be expected. Saving only to see that air connections are maintained perfectly tight, there is little to do.

CHRISTENSEN IGNITION SYSTEM

Making Tools More Easily "Getatable."

There is one thing about tools—that is, tools that are carried on an automobile—that most people have noticed. They always are wanted in a hurry, when they are wanted at all, and they always are put away in a hurry. Ordinarily the result is chaos in the tool box, and the next time any particular implement is needed it has to be dug up from beneath all of the others. An excellent scheme is to have the tools that are most in demand—pliers, screwdrivers, hammer, a few much-used wrenches, etc.—in a small leather bag, which can be grabbed in an instant and the right tool picked out, and can be as quickly re-packed and put away. Less used tools can be rolled up, or otherwise disposed of, but the ones that are sure to be needed when there is anything to be done should be right at hand, and a little forethought of this kind pays well.

Adjustments that Require Time to Show.

When making motor adjustments it usually is necessary to exercise a little patience in order to get the best results, for the reason that the effects of adjustments are not always instantly apparent. In carburetter adjustments, for instance, the motor must be given a little time to feel the changes made, and the results obtained immediately following the turn of a needle-valve or an air-valve spring may be misleading. The same is true of lubrication adjustments, only to a much greater extent, for it is clear that it takes some time for oil previously supplied to work through and for the new rate of supply to settle down to steady work. "Make haste slowly" is an old saw that fits the case very well.

Value of Mending Tire Cuts Quickly.

It is believed by some that a tire cut that is repaired while still fresh, immediately after it is has been made, will be a better job and more lasting than if the cut is allowed to stand for some time before mending. Whether there is any truth in the idea or not, it is a fact that a cut cannot be mended too soon, and this for obvious reasons.

Getting Pure Gasolene from the Earth.

According to a report from abroad, an oil well has been sunk in the Emilia district in Italy from which pure gasolene is taken, its specific gravity being .757 in its crude state. Upon distillation at 150 degrees C., or less, all the oil passes over, leaving no residue.

1,046,359. Two-Cycle Engine. Alexander Winton and Harold B. Anderson, Cleveland, Ohio, assignors to the Winton Motor Carriage Co., Cleveland, Ohio. Filed April 2, 1908. Serial No. 424,817. (Two-cycle motor with gas chamber and ports in piston body.) 4 claims.

1,046,388. Motor Vehicle. Louis A. Hill, Washington, D. C., assignor to Pneucar Co., Washington, D. C., a corporation of Delaware. Filed Nov. 4, 1911. Serial No. 658,570. (Spring supported power and transmission systems.) 7 claims.

1,046,392. Explosive Engine. Martin C. Kessler, Denver, Col., assignor to the Kessler Motor Co., Denver, Col. Filed Sept. 6, 1907. Serial No. 391,-675. (Opposed four-cycle motor using crankcase compression to pump air to cylinders.) 10 claims.

1,046,407. Starting Device for Explosive Engines. Lewis C. Van Riper, New York, N. Y. Filed Feb. 20, 1911. Serial No. 609,760. (Friction-clutch anti-kick crank.) 9 claims.

1,046,451. Tire-Mail. Joseph B. Duhring, Chestnut Hill, Pa. Filed Dec. 15, 1911. Serial No. 665,932. (Sheet metal link armor imbedded in tire tread.) 8 claims.

1,046,463. Electric Circuit Controller. Walter D. Heath, Lakeport, N. H., assignor, by mesne assignments, to A. V. Mfg. Co., New York, N. Y., a corporation of New York. Filed Nov. 23, 1911. Serial No. 661,970. (Timer with bell-crank contact levers.) 7 claims.

1,046,491. Gas Engine. Alfred Randolph, Salem, Ohio. Filed Aug. 24, 1910. Serial No. 578,740. (Two-cycle motor with extra piston for augmenting crank-case compression.) 5 claims.

1,046,495. Vehicle Brake. Frederick Henry Royce, Derby, England. Filed Oct. 27, 1911. Serial No. 657,-148. (Toggle-operated expanding brake.) 1 claim.

1,046,524. Oiling System. Charles E. Wiffler, Detroit, Mich. Filed Jan. 17, 1910. Serial No. 538,345. (Oil distribution to crankcase and gearcase of unit power plant by flywheel.) 2 claims.

1,046,553. Spring Suspension for Vehicles. John Joseph Charley, Malvern, Victoria, Australia, and Frederick Lamplough, London, England; said Lamplough assignor to said Charley. Filed March 26, 1912. Serial No. 686,444. (Lever linkage in combination with leaf and coil springs.) 4 claims.

1,046,565. Wind Shield Attachment. William R. Donegan and John J. Walsh, Hartford, Conn. Filed Jan. 9, 1911. Serial No. 601,520. (Windshield supporting system.) 6 claims.

1,046,606. Spring Wheel. Starling Kilgore, Crosby, Tex. Filed July 20, 1912. Serial No. 710,719. (Wheel with coil spring spokes and jointed levers between hub and rim.) 1 claim.

1,046,629. Fastening Device for Tires. William Robert Morrison, Chicago, Ill. Original application filed April 17, 1911, Serial No. 621,476. Divided and this application filed Oct. 30, 1911. Serial No. 657,-549. (Expanding and contracting ring solid tire fastening.) 3 claims.

1,046,656. Shock absorber. Fridolin Schimmel, Faribault, Minn. Filed Dec. 11, 1911. Serial No. 669,996. (Double-arm and segment friction shock absorber.) 3 claims.

1,046,681. Automobile Chassis. Morris S. Towson, Cleveland, Ohio. Filed April 1, 1909. Serial No. 487,-188. (Power plant carried on reach between axle and cross frame, driving through gearbox on rear axle.) 2 claims.

1,046,687. Rotary Engine. John Herbert Van Deventer, Buffalo, N. Y., assignor to Buffalo Forge Co., Buffalo, N. Y., a corporation of New York. Filed April 22, 1912. Serial No. 692,310. (Rotary motor with two herringbone gear rotors with intermeshing teeth.) 10 claims.

1,046,704. Explosive Engine. Samuel Ybarra, St. Louis, Mo. Filed Jan. 26, 1912. Serial No. 673,556. (Two-cycle motor with two-diameter piston and cylinder.) 6 claims.

1,046,712. Resilient wheel. Bedolph Anderson and Clyde L. Miles, Boston, Mass. Filed Sept. 16, 1910. Serial No. 582,425. (Wheel with spring-cushioned hub.) 5 claims.

1,046,738. Gas Engine. Frank L. Cross, Wollaston, Mass. Filed Feb. 24, 1908. Serial No. 417,282. (Speed regulation of two-cycle motor by returning part of charge to crankcase on compression stroke.) 7 claims.

1,046,756. Automobile Horn. Delroy Fifield, Cleveland, Ohio. Filed Feb. 12, 1912. Serial No. 677,261. (Exhaust operated horn.) 2 claims.

1,046,774. Vehicle Tire. John J. Grefenstette, Pittsburgh, Pa. Filed Oct. 31, 1911. Serial No. 657,756. (Solid tire and bolt retainers.) 1 claim.

1,046,804. Wheel of Vehicles. Edward Claude Kingsford, London, England; Philip Arthur Kingsford, Flimwell, England, executor of said Edward Claude Kingsford, deceased. Filed April 1, 1911. Serial No. 618,453. (Pneumatic tire with solid tread clamped on, and means for securing to rim.) 1 claim.

1,046,808. Controlling Device. Max Kuhn and Raphael Netter, New York, N. Y.; said Netter assignor to said Kuhn. Filed Aug. 26, 1911. Serial No. 646,181. (Taximeter connected with passenger's seat, pressure on seat connecting meter with driving mechanism.) 13 claims.

1,046,825. Gas Starter for Internal Combustion Engines. Thomas J. McCarthy, Detroit, Mich. Filed July 17, 1912. Serial No. 709,851. (Ignition starter with separate starting fuel tank.) 9 claims.

1,046,846. Circuit Controller. Daniel L. Ordway and John W. Brown, Lakewood, Ohio, assignors to National Carbon Co., Cleveland, Ohio, a corporation of New Jersey. Filed April 22, 1909. Serial No. 491,444. (Combined timer and distributer.) 4 claims.

1,046,855. Tire-Clencher-Ring Lock. Peter Recconi, San Francisco, Cal. Filed Oct. 21, 1911. Serial No. 655,899. (Clincher tire retaining-ring and locking device.) 2 claims.

1,046,900. Shock Absorber. Roy James Thompson, Muskegon, Mich. Filed Feb. 16, 1911. Serial No. 609,044. (Piston-and-cylinder shock absorber.) 1 claim.

1,046,917. Fender. Charles H. Wegner, Baltimore, Md., assignor of one-third to Henry F. Sleepack and one-third to Amelia C. Wegner, Baltimore, Md. Filed Feb. 13, 1912. Serial No. 677,329. (Automobile fender of street car or pick-up type.) 4 claims.

1,046,947. Safety Cranking Device for Explosive Engines. John L. Beck, Springfield, Mass., assignor, by mesne assignments, to Auto Safety Crank Co., Holyoke, Mass., a corporation of Massachusetts. Filed Nov. 4, 1910, Serial No. 590,687. Renewed Aug. 16, 1911. Serial No. 644,452. (Anti-kick crank with friction clutch.) 10 claims.

1,046,988. Hydro-Carbon Motor. Paul Daimler, Stuttgart, Germany, assignor to Daimler Motorengesellschaft, Unterturkheim-Stuttgart, Germany. Filed May 29, 1909. Serial No. 499,249. (Motor in which fuel is pre-heated and enters mixing chamber under pressure.) 1 claim.

1,046,989. Shock-Absorber for Vehicles. Henry Allen Dalley, Ardmore, Pa. Filed Dec. 18, 1911. Serial No. 666,472. (Pivoted lever shock-absorber with spring resistance.) 2 claims.

1,047,017. Door Curtain for Vehicles. Horace Ervien, Ogontz, Pa. Filed Dec. 28, 1911. Serial No. 668,382. (Section of side curtain swinging with door.) 5 claims.

1,047,015. Valve for Explosive Engines. William C. Elrod, Fair Play, Mo. Filed Jan. 2, 1912. Serial No. 668,858. (Removable water-jacketed valve cage.) 3 claims.

1,047,109. Friction Clutch. William H. Nelson, Ardmore, Pa. Filed Jan. 27, 1912. Serial No. 673,-802. (Expanding clutch with segmental friction members.) 2 claims.

1,047,166. Repair or Reinforcement of Pneumatic Tires. Thomas Edwin Cann, Leicester, England. Filed June 9, 1910. Serial No. 565,985. (Tire repairing system employing leather and fabric for patches.) 2 claims.

1,047,190. Resilient Wheel. Wayne C. Fickes, Shirland, Ill. Filed Oct. 21, 1911. Serial No. 656,-075. (Double-rimmed wheel with outer rim spring-supported from inner rim.) 6 claims.

1,047,197. Automobile Fire Engine. Henry M. Gabel, Cincinnati, Ohio. Filed Aug. 17, 1912. Serial No. 715,556. (Gasolene motor drive for steam fire engine.) 6 claims.

1,047,204. Inner Tube Guard for Pneumatic Tires. Siegfried Goodman, Bayonne, N. J. Filed Dec. 13, 1911. Serial No. 665,419. (Tire boot of layers of fabric secured by straps.) 1 claim.

1,047,227. Internal Combustion Turbine. Ezra F. Hopkins, Chicago, Ill. Filed Jan. 11, 1910. Serial No. 537,447. (Radial cylinders surrounded by rotor with buckets or vanes.) 18 claims.

1,047,232. Rotary Explosive Engine. Sidney H. Ivery, St. Louis, Mo. Filed Nov. 17, 1911. Serial No. 669,837. (Revolving cylinder motor.) 9 claims.

1,047,238. Vehicle Steering Mechanism. Samuel H. Kennedy, Tunnel Hill, Ga. Filed Jan. 6, 1912. Serial No. 669,771. (Rack-and-pinion gear with link and lever connections to pivots.) 5 claims.

1,047,268. Cushion Wheel. John Millar, Arlington, N. J., assignor of one-half to Duncan Campbell, Arlington, N. J. Filed March 3, 1911. Serial No. 612,-129. (Pneumatic-cushioned wheel.) 5 claims.

1,047,271. Convertible Motor-Boat and Automobile Combined. Hartley A. Mitchell, Newport News, Va. Filed Nov. 13, 1911. Serial No. 660,067. (Boat-automobile with means for housing wheels when in the water.) 22 claims.

1,047,276. Speed-Controlling Device. Burt G. Nelson, Milwaukee, Wis. Filed March 20, 1911. Serial No. 615,468. (Electric speed control operated by speedometer.) 4 claims.

1,047,286. Motor Vehicle. James E. Plew, Chicago, Ill. Filed April 5, 1909. Serial No. 487,956. (Seat-backs that can be lowered into a horizontal position, forming a continuous surface with the seat cushions.) 3 claims.

1,047,297. Resilient Wheel. Lewis S. Robbins and John R. Davis, Vine Grove, Ky. Filed April 15, 1911. Serial No. 621,343. (Wheel with hub cushioned by small pneumatic tire.) 1 claim.

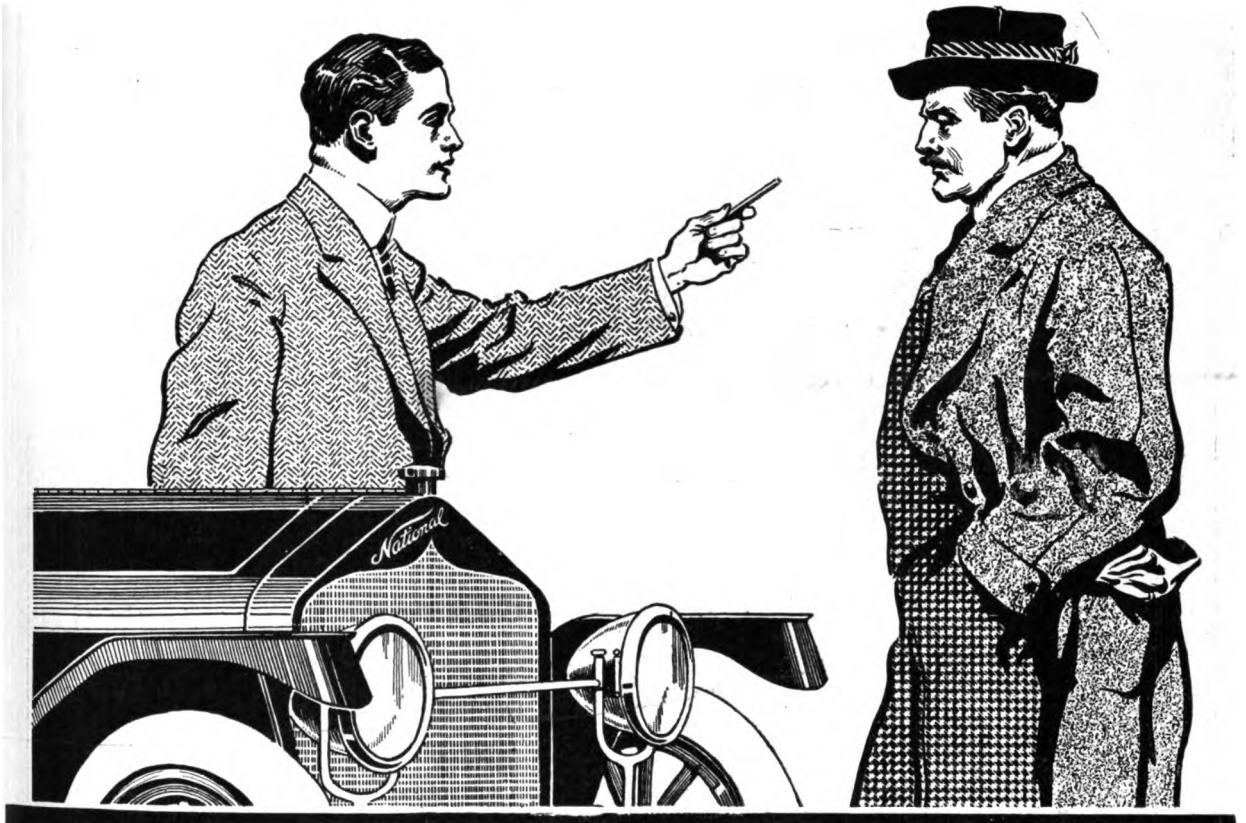
1,047,3033. Spare-Tire Cover. Henry A. Sallop, New York, N. Y. Filed Feb. 26, 1910. Serial No. 546,143. (Spare tire cover in two sections.) 3 claims.

1,047,310. Side Curtain for Automobiles. George W. Scott, Troy, Ohio, assignor to The Star Storm Front Co., Troy, Ohio, a corporation of Ohio. Filed April 13, 1910. Serial No. 555,229. (Flexible support for side curtains.) 5 claims.

1,047,319. Spring Vehicle Wheel. Cicero G. Smith, Palisades, Col. Filed Sept. 27, 1911. Serial No. 651,662. (Wheel with curved spring spokes.) 4 claims.

1,047,329. Electro-Magnetically-Controlled Power-Transmission Mechanism. August Sundh, Yonkers, N. Y., assignor to Otis Elevator Co., Jersey City, N. J., a Corporation of New Jersey. Filed March 6, 1909. Serial No. 481,839. (Electro-Magnetic control for hydraulic transmission.) 32 claims.

1,047,407. Resilient Tire for Vehicles. Harry D. Hart, San Diego, Cal. Filed Nov. 13, 1911. Serial No. 659,959. (Woven wire cable coiled to form a tire.) 4 claims.



1,047,409. Pneumatic Tire Pump Coupling. Reginald F. Hersey, Beverly, Mass. Filed Jan. 6, 1912. Serial No. 669,900. (Cam for clamping coupling to valve.) 1 claim.

1,047,477. Shock-Absorber. Gideon D. Yates, Isle, N. Y. Filed July 13, 1912. Serial No. 709,282. (Auxiliary spring device for single cross-spring suspension.) 5 claims.

1,047,485. Combination Spring-Cushion Tire Wheel. Robert F. Balding and Howard Pratt Garland, Los Angeles, Cal. Filed March 6, 1907. Serial No. 360,-978. (Pneumatic tire inside rim.) 6 claims.

1,047,527. Gas Engine Starter. Charles Francis Jenkins, Washington, D. C. Filed Nov. 11, 1910. Serial No. 591,797. (Distributer system for air starter.) 1 claim.

Now is the time to become part of the *National* sales organization

You cannot possibly make a better or more profitable connection than to join the great *National* Sales Organization.

The *National* Company is favorably known for *square dealing*, *liberal* policy and the *advertising* and *sales* support given its dealers.

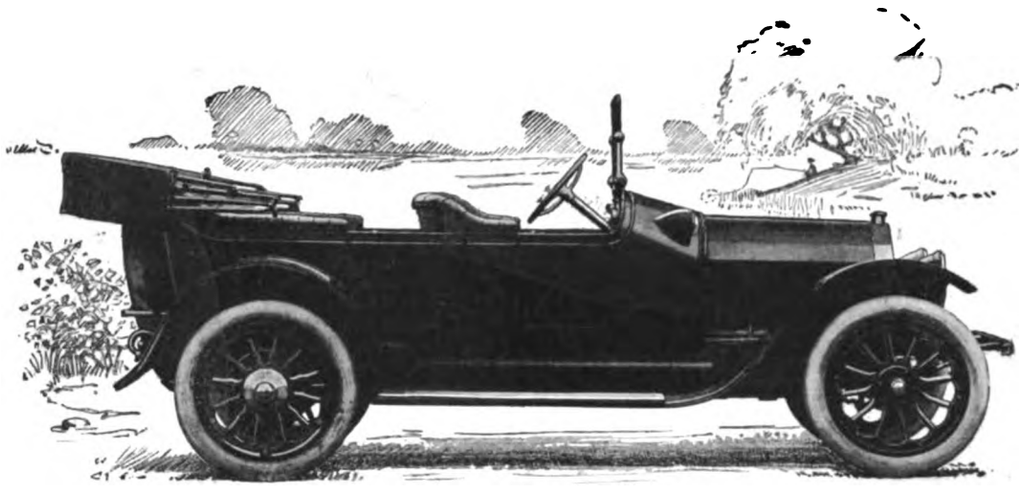
Here is a car made by enterprising manufacturers of unquestioned financial responsibility—backed by 13 years experience in building motor cars—a car that has *made good* with the dealer as well as the user. The

National

—by its power, ease of operation, beauty of design and luxurious finish, its mechanical performance in the severest tests—has proved its right to take the leadership in the foremost rank of motor cars today.

Every owner of a *National*, every dealer selling the *National*, is a *National* booster.

Once you become a part of the great *National* Sales Organization you will find it easy to build up a profitable business—your profits will not be eaten up by needless "come-backs" and shop expenses.



If we do not happen to have a *National* representative in your territory, here is a big sales opportunity—a money-making, business-building opportunity you simply cannot afford to neglect.

Come to Indianapolis and visit our factory if possible—if not, write immediately for complete specifications, illustrations of our various models, prices and liberal offer to dealers.

Let us hear from you by return mail—your request for information will imply no obligation on your part.

The National Motor Vehicle Company, Dept. 90, Indianapolis, Indiana

PATHFINDER TOURING CAR
40 horse power *120 inch wheelbase*

You can have the same success we are having with the Pathfinder

¶ Announcements are always interesting. Maybe they will open to you a chance to make a more profitable connection. They will surely give you a line on your competition.

¶ The Pathfinder announcements are awakening more interest because it is generally conceded that it is a beautiful car, and that the mechanical construction represents the best in European and American engineering.

¶ Possibly you do not care particularly about car construction and your interest lies in the jingle of hard dollars rather than in the hum of a motor.

¶ Times have changed in the auto game, and you must sell a good car to make money. It follows naturally that the most money will follow the best car.

¶ The Pathfinder is that car. Proof?—Our sales last period increased 117% over the same period in 1912, the largest increase of any established car.

¶ The Pathfinder will make you money permanently. It is one of the four best money makers in the market today.

¶ Don't delay, but start right in your 1914 business by working with us.

¶ Write us what territory you can cover and we will submit a plan whereby you can make a similar increase in your business. Our scientific selling plan combines the "101 Reasons" and will show you the way to unexpected profits.

THE MOTOR CAR MFG. CO.

1138 Division Street Indianapolis, U. S. A.

New Stearns-Knigh

Stearns-Knight Six-Cylinder Seven-Passenger Touring Car
Equipped with Wire Wheels.

Left Hand Drive and Center Control
—a necessary feature of every high-grade car.

Centralized Steering Column Control
—not a cumbersome affair, but a neat arrangement, small and compact, just under the wheel.

Wire Wheel Option
— Rudge - Whitworth wire wheels furnished at slight extra expense.

Starting and Lighting
—the Gray & Davis system on all models.

Upholstery
—deep, thick upholstery. Tonneau luxuriously trimmed.

Design
—tapered hood, flush with cowl. Hood, cowl and body are unbroken surface.

Auxiliary Seats
—tonneau chairs exceptionally comfortable, with upholstered arms.

Equipment
—absolutely complete, including speedometer, Klaxon horn, electric lights, etc.

The new Stearns-Knight models are the most advanced in both mechanical design and detail finish that have ever been placed upon the American market.

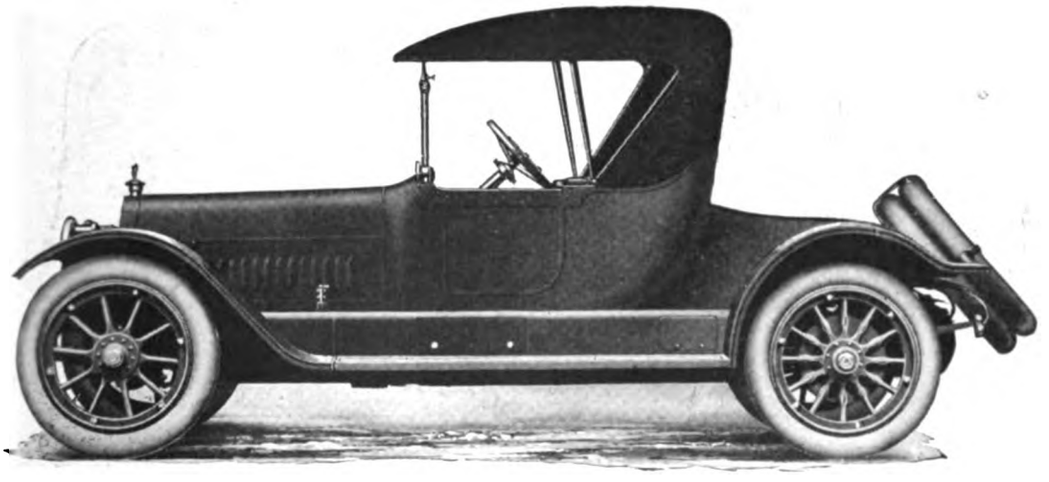
Models Are Ready



Prices range from $3750 to $5100 for the four-cylinder models, and from $4850 to $6200 for the six-cylinder product.

Models new this year include special four- and six-passenger cars, and Sedan and Coupe models, all furnished in either four- or six-cylinder chassis.

Endurance is the Supreme Test

Five times around the earth and still good—two hundred fifty million, five hundred forty thousand revolutions under load do not wear out

NEW DEPARTURE BALL BEARINGS

During the life of these bearings, five sets of bearings of another type were worn out and replaced. New Departure ball bearings work with the least friction and, therefore, give maximum wear and service—American made and guaranteed.

Removal Notice

To meet the tremendous increase which there has been in the demand for MULTIBESTOS BRAKE LINING, STANDARD WOVEN BELTING and SOLID MULTIPLE HOSE FABRICS a new factory has been built and equipped for the manufacture of these products on a much larger scale.

This has made necessary the abandonment of our old plant at Worcester where we have done business for many years, but where facilities were proving more and more inadequate to meet the growth and expansion of our business.

In the new factory at Framingham will be found every modern feature tending to promote quality and economy of production, not only of our present lines but of extensions which embrace everything in the way of woven fabrics for mechanical purposes.

Under such ideal conditions for doing business we can ask a continuance of orders from old customers and an investigation from new prospects with the full confidence that we can serve them to their profit and entire satisfaction.

Standard Woven Fabric Company

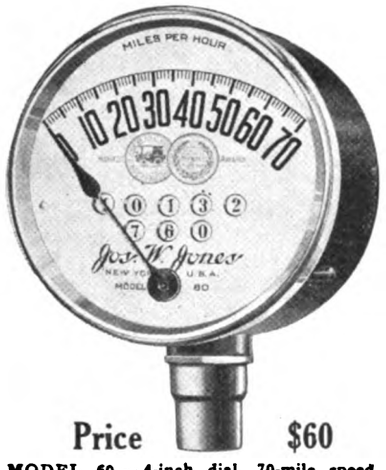
Jones Branches and Agencies Everywhere

There are Jones Branch Houses and agencies in all of the principal cities of the world.

These branches and agencies are managed by men who have had a wide experience. They are chosen for their ability to handle every transaction to the absolute satisfaction of all who deal with them. They are experts—men of education. They are gentlemen. And they have the finest speedometer built—to make this cycle of service complete.



The New York Service Station

Simplicity is Vital

The New Jones is the simplest speed indicator. It has the fewest parts. It is built of the very best material offered for each purpose. We grind every part where exactness is needed to the one ten-thousandth part of an inch. With this simplicity and construction the Jones is the strongest speedometer. The accuracy we obtain in each instrument is thus permanently intrenched.

13-year-old Jones are as accurate now as the day they were placed on their first motor cars. Many today are on their fifth and sixth cars, giving perfect service. The New Jones will outlast many times over any old Jones ever built.

Price $60

MODEL 60—4-inch dial, 70-mile speed scale, with large, equally spaced figures. Low initial speed indication. Large Odometer figures, registering to 100,000 miles and repeat for the season, and 100 miles and repeat for the trip. Tenths of miles shown by red right hand figures. Instantaneous trip reset. Standard finish—black enamel with nickel trim, brass optional. Leather covered casing.

Motorists Want "Year 'Round" Speedometers

Men are now driving their cars the year 'round instead of merely in spring and summer. They want a speedometer that shows the true speed in every temperature. Jones advertising, reaching millions each month, is convincing them that the Jones does show it. We are explaining in every Jones ad all the advantages—the Steady Hand, that moves or rests without the least vibration—the Immovable Dial and Large Speed Figures, the easiest dial to read—the Correct indication from one mile per hour up to the highest speed each instrument shows—and the **absolute accuracy at all speeds, at all times, regardless of temperature.**

Let Us Send This Man

There's a man in our factory who has every Jones detail at his finger tips. He can answer your every question and give you every fact. He can take a Jones instrument apart and point out exactly and clearly every Jones advantage. He has the Jones Proposition to car manufacturers, and the authority to make it conform to your needs. In sending for the Jones books and naming a date convenient to you on which you can talk with this representative you are obligating yourself none whatever.

Price $125

MODEL 175—Same as model 75, with 3-in. Chelsea 8-day stem-wind and stem-set clock, and electric light.

"Bower Saves Power"

Twenty-one Places Where "Bower Saves Power"

The real power of an automobile is not that of its motor. It is the amount available after friction has taken its toll.

There are 17 principal places in an automobile where friction robs it of its power. There are besides four places where the power of the driver in steering may be wasted.

Friction is the thief of power.

Location of Bower Bearings

4 in Front Wheels
4 in Rear Wheels
2 in Differential Gear
2 in Propeller Shaft
5 in Transmission
4 in Steering Gear
21

Bower Roller Bearings are Power's Guardian because through their original design, a maximum diameter of roller is permitted, the rollers are self-aligning and the bearing never needs adjustment. These are exclusive features.

Bower Roller Bearing Co.

Power in Fuel

The power you get from a gallon of gasoline ordinarily and the power you would get from a gallon of gasoline filtered through an Ellis Gasoline Purifier is about in proportion to the measures shown in the illustration.

No amount of skillful carburetor adjustment can ever make a gallon of gasoline produce 100% of its power unless the water or sediment, ever present in commercial gasoline, is eliminated. The fault is more often in the gasoline, not in the carburetor. The remedy should be applied to the gasoline before it reaches the carburetor.

The Ellis Gasoline Purifier is simple and efficient. Its real value is found in the trouble it prevents as well as in the increased efficiency it imparts by refining the fuel. It is attached simply and easily and requires only passing attention—that of draining off water and sediment it collects. In design the Ellis Gasoline Purifier takes advantage of the greater specific gravity of water and sediment to that of gasoline. As the gasoline passes through the fine screens and felt filter pads, all sediment and water is caught and drops into a chamber on the underside of the appliance where it may be removed at the rider's convenience.

Sells Retail at $3.50, Prepaid

Ellis Gasoline Purifier

is one of the best selling motorcycle accessories on the market. Motorcyclists have felt the need of it and buy it readily once its working is explained to them. Carburetor trouble leads to many other kinds of trouble. It is a vital part of a motorcycle and one of the least understood parts. The ordinary carburetor will give good satisfaction when used in connection with an Ellis Gasoline Purifier. Write for further particulars. Dealers are invited to get our agency proposition.

NATIONAL SALES CO., Sole Manufacturers 45 Milk St., Boston, Mass.

DEALERS

The Ellis Gasoline Purifier is the final remedy for carburetor troubles. It will, in a large degree, eliminate the troubles which cause an automobile or a motorcycle to give a low mileage per gallon of gasoline.

Automobile owners and motorcyclists are being told the money-saving and trouble-saving advantages of the Ellis Gasoline Purifier. The above is an example of how we are creating a demand on the part of motorcyclists. The practical value of the Ellis Gasoline Purifier, exploited by our aggressive advertising campaign, makes it well worth your while to send for full information and particulars. Don't wait.

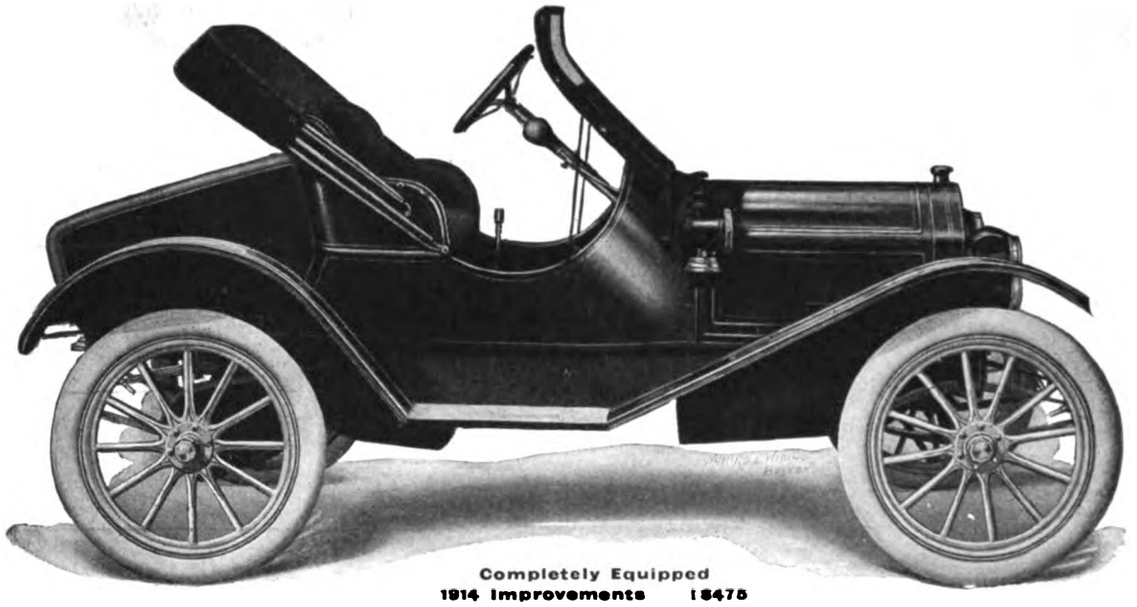
Sell METZ Cars and build up a line of satisfied and enthusiastic customers who will send their friends to you.



METZ "22"—$475

Winner of the Glidden Tour
and both the Glidden and Minneapolis News trophies, is the

Lowest Priced Car on the Market

The Proved Efficiency Car

We Want a Representative to Handle These Cars in Every City and Town. Write Us for Territory and Liberal Terms.

Completely Equipped
1914 Improvements $475

GEARLESS TRANSMISSION

No Clutch to Slip ***No Gears to Strip***

In the Glidden Tour, which started at Minneapolis on July 11th and ended at Glacier National Park on the 19th, the team of three METZ cars was the ONLY team that held a PERFECT record for the ENTIRE EIGHT DAYS. They were pitted against cars costing from five to ten times as much, yet their nearest competitor made a perfect score for only the first two days.

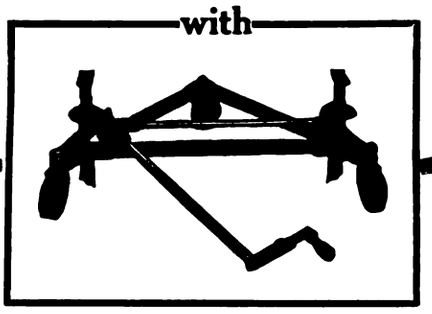
The METZ "22" was last to leave the noon control on the final day of the race, passed all the cars ahead, and when ten miles from the goal caught the pace-maker and crowded him over the last mountain range, finishing with twenty minutes to spare!

The METZ "22" is a roadster car of the torpedo semi-enclosed type, left-hand drive, center control. It makes from 5 to 50 miles per hour on the high speed, travels from 28 to 32 miles on ONE gallon of gasoline, 100 miles on ONE pint of lubricating oil, and from 10,000 to 12,000 miles on a single set of tires.

It is the most economical car on the market to operate. Climbs hills as fast as any regular stock car made. Takes many hills on the high speed that are steep enough to force the big touring cars to drop back on low speed.

Equipment—4-cylinder 22½ h.p. water-cooled motor, Bosch magneto, windshield, extension top with cover slip and curtains, full elliptic springs all around, standard artillery wheels, best quality Goodrich clincher tires, five lamps and gas generator, horn, pump, and tool outfit.

Built to carry either single or double rumble seat, if desired. Its gearless transmission entirely does away with aggravating and expensive "gear troubles."



Reasonably prompt deliveries. Write for dealers' terms and new illustrated catalog "B."

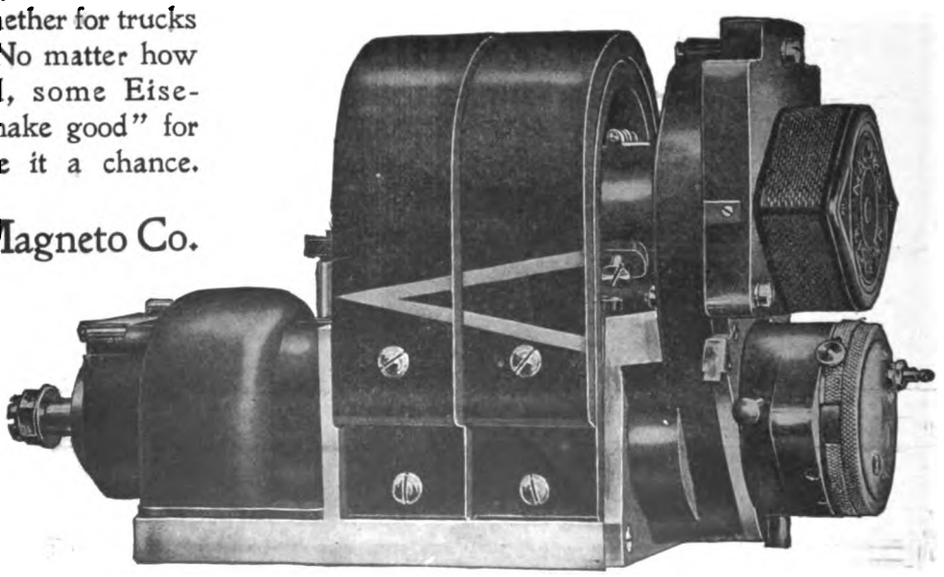
Making good is a habit with Eisemann products. Witness the fact that 39 truck makers insist upon Eisemann ignition to help them make good. First of all in truck manufacture comes dependability. That's why Eisemann ignition is prevalent on the leading trucks. Then in turn is efficiency, simplicity snd durability—all additional features of Eisemann design and construction. And the spark?—well, it's so hot and fat that a quarter turn is sufficient to start any motor.

EISEMANN



Remember, too, that there is an Eisemann ignition system to meet every requirement—whether for trucks or for pleasure cars. No matter how large or how small, some Eisemann system will "make good" for you if you'll but give it a chance.

FEDDERS RADIATORS

FOR some years to come, at least, the automobile engineer's problem, in so far as motors are concerned, will deal not with the creation of a radically different type of motor, but in increasing the efficiency, economy and smooth running power of accepted standard types.

Probably no other part of the automobile affects the perfect working of a motor more than its cooling system.

Fedders standard radiators have always been recognized as the highest type of cooling efficiency and as embodying the best of materials and methods of radiator construction.

We are always glad to cooperate with your engineers on radiator problems. Our facilities enable us to serve your needs promptly, either in standard Fedders Radiators or in radiators built to your own design.

The use of copper cores and Fedders methods of construction will add materially to the efficiency of your cooling system. Write us.

This monogram stands for all you can ask in a motor car

You Can Buy

an automobile for less than the Chalmers price, but you cannot get Chalmers features and quality in that automobile.

We mean that. And we can prove it. For any less than the Chalmers price you can't get, for instance, a motor of equal quality. Big and sturdy, quiet but powerful, this motor delivers to the driving wheels its full rated horsepower—day in, day out, summer and winter. It hangs on.

You can't get, for less than the Chalmers price a four forward-speed transmission and all ground gears. Four forward speeds mean utmost flexibility. All ground gears mean freedom from noise, friction, wear. Insist on a four forward-speed transmission. Once you have used this wonderful improvement you will never be satisfied to drive a three-speed car.

For less money than the Chalmers price, you can't equal Chalmers convenience—such conveniences, for example, as Chalmers reliable self-starter; electric lighting system; demountable rims; carburetor dash adjustment.

Comfort equal to that of the Chalmers you can't possibly secure for less than the Chalmers price. In fact, we doubt if you can get the same complete restfulness in any car at even higher prices. Luxurious cushions and upholstery; long wheelbase; big wheels and tires; long, flexible springs—make Chalmers riding a delight.

Beauty, style, elegance—no car at any price **surpasses** the Chalmers in these qualities. Certainly you cannot **equal** the Chalmers in these respects for less than the Chalmers price.

Chalmers quality is inbuilt in Chalmers cars—the result of Chalmers manufacturing methods. Chalmers cars are **manufactured** cars. They are built in our own shops by Chalmers men, under the most vigorous Chalmers inspection (one inspector to every 13 workmen). No car at **any** price contains better material, no more careful, painstaking workmanship.

For **less** than the Chalmers price you inevitably get less than the Chalmers quality.

It pays to buy good quality at the start. It pays to buy a Chalmers car—a quality car at a medium price.

Don't try to "save" money at the cost of permanent satisfaction.

See the Chalmers cars at our dealer's and let him tell you more about the Chalmers quality cars.

Chalmers Motor Company, Detroit, Mich.

EXTRA!

The "Oilproof" Quality

—hitherto the exclusive and remarkable extra-service feature of Vacuum Cup Tires, is now extended to our entire output of Smooth Casings, and these will hereafter be known as

PENNSYLVANIA Oilproof SMOOTH TREAD TIRES

This costly improvement will carry with it a 500-mile increase in the mileage guarantee, from 3,500 to 4,000 miles, coincident with a relative increase in the guarantee of Vacuum Cup Tires from 4,000 to 4,500 miles.

Our manufacturing application of this improvement dates back to April 1st, so that the new guarantee is retroactive on all casings shipped on or after that date.

Thus our whole production of Automobile Casings is removed from the field of ordinary competition and the brand "Pennsylvania" becomes completely distinctive of a standard of service unique and unapproached in other tires.

That the oilproof feature is more than equivalent to 500 miles additional service, the past year's carefully observed records of Vacuum Cup Tires have amply proved.

The fact is now well known among experts that the production of the Oilproof quality is the most costly of all forms of tire construction, since only special grades of the finest and purest new rubber will "process" successfully with the oilproofing minerals, themselves an expensive item, and the entire operation requires unusual facilities.

All dealers should immediately make an important point of the foregoing fact, inasmuch as the addition of the Oilproof quality represents a very considerable extra manufacturing cost as well as an even greater extra value in the shape of longer mileage service.

REO MODEL J
Capacity 2 Tons

$1,800 F. O. B. Lansing
Body Extra:

The Dawn of a Better Business Day

Modern business gets its profit out of what it saves. Even small economies amount to big annual dividends. If you can show your customer how to cut delivery costs with the REO MOTOR TRUCK, you have shown him how to increase his profits.

That is the way over 1,100 dealers are selling REO MOTOR TRUCKS. With a motor truck like the REO, it is an easy matter for you to make many sales in your territory.

Every Reo Truck is a Money Maker for Its Owner

REO efficiency is tried, tested and proven. Read, for example, the following record of a single day's performance of a REO MODEL J 2-TON TRUCK owned by the Schramm Grocery Co., Flat River, Mo.

"Five round trips in one day to four outlying towns, average load 4,096 lbs. Total mileage 62. Gasoline consumed 8 gallons. On these roads twenty miles with a two-ton load would be a long day's work for a team of horses."

8 gallons of gasoline at 20c.	$1.60
Tire cost, 60 miles at 2c.	1.20
Driver's wages, one day	2.50
Depreciation at $650 per year	2.00
Repairs and overhauling at $150 year	.50
Interest on investment	.35
Fire insurance	.15
Oil and grease	.40
Total daily expense	$8.70

Thus this truck did the work of three teams, which with wagons and harness would cost $2,100. The daily cost was only $8.70 while three teams would cost for drivers alone $7.50.

A Simple Way to Judge Truck Values

You are, of course, sufficiently versed in technical values to judge of the unusual importance of the many exclusive features that REO experience and organization have enabled us to put into this wonderful truck.

The impregnable armored frame, the REO sectional radiator, with its 24 independent, interchangeable units, the left side drive and center control, the REO hydraulic speed governor, the famous REO motor cushioned against vibration and road shocks, to mention but a few points of obvious superiority.

But to anyone not technically versed in motor car construction, here is a simple statement of business fact: The average price of 54 competing trucks is $2,701, a clear saving of nearly $1,000 in favor of the REO. What does our competitor offer you that is worth that extra $1,000?

If you are a live motor car dealer, looking for the right motor truck to sell in your vicinity, write us. We have some good territory still open.

THE railroads do not buy their oil by the gallon—they buy it by the mile. The reason is obvious.

The automobilist is apt to think that the selection of a cheap oil is simple. It is the reverse. It is complex.

Into the matter enter such questions as the relation between miles travelled and gallons consumed, and the relation between cost and up-keep and cost per gallon per mile.

Although many different brands of oil are being called to your attention by extravagantly worded advertisements,

it is a well known fact that the scarcity and increased cost of Pennsylvania Crude has lowered the gravity and consequently the quality of lubricating oil, just as it has lowered the gravity and quality of gasolene. This parallel is exact.

Invader Oil is one of the few high gravity, one hundred per cent. Pennsylvania Oils now being marketed and its use will prolong the life and efficiency of any gasolene motor. It is the cheapest because it is the most efficient. It costs less in dollars and cents per thousand miles than any other oil made.

FISK Tubes

Fisk Inner Tubes Are Not *Simply* Tubes

They Are Dollars in the Car Owner's Pocket because they Greatly Reduce His Tube Expense.

FISK TUBES ARE PERFECT. There is no guess work, no chance about them. We have doubled the service and halved the expense for thousands of tube buyers. ***We can do it for your customers.*** Our confidence is based on a long record of actual accomplishment.

Fisk Tubes are pure gum tubes, made of the finest Pure Para Rubber vulcanized by the aid of sulphur to exactly the right degree to produce long life. You cannot take one of them in your hand without appreciating its quality from the texture.

Fisk Tubes have an original splicing which makes thin spots impossible. They are never porous. The construction is such that no imperfection can be present to develop a slow, but constant leak of air.

Send to Dept. 23 for Sample Section of Fisk Tube. It Tells the Story of Fisk Quality.

Fisk Tubes are built regardless of cost. The only economy which is recognized is that which we can ultimately offer the tire user. Only a tube built like the Fisk can give FISK SERVICE.

1914 "SIX-48" KEETON

THE COOLEST CAR FOR SUMMER TOURING

$3250 Completely Equipped

"Six-48" Riverside Touring Car

IN the hot summer months the front compartment in the ordinary type of fore-door car is excessively warm, causing great discomfort to the occupants. This is due to the method of drawing the air through the radiator and forcing it back over the engine and out underneath the front floor boards. This hot air keeps the front compartment at an almost unbearable degree of temperature. Many makers have tried to overcome this by using ventilators, hinging the doors so that they are partly open—tilting the windshield back—and many other makeshifts that are only partly successful.

The front compartment of the Keeton is always at an even cool temperature. The hot air is forced out through the sides of the radiator **away** from the car. There is a draft of **cool air** under the front floor boards at all times.

The French type of the Keeton with its sloping hood also gives the driver a better view of the road directly in front of the car. This feature makes the Keeton more easily handled on rough roads or in night driving where it is imperative to get an unobstructed view of the road immediately in front of the car.

The long wheel base—wire wheels with big tires—long flat springs of special alloy spring steels—the balance of weight gained by the dash location of the radiator—the light weight—smooth running 6-cylinder motor with its great freedom from vibration, and the luxuriously roomy body all combine to insure an ease and comfort that is unequalled.

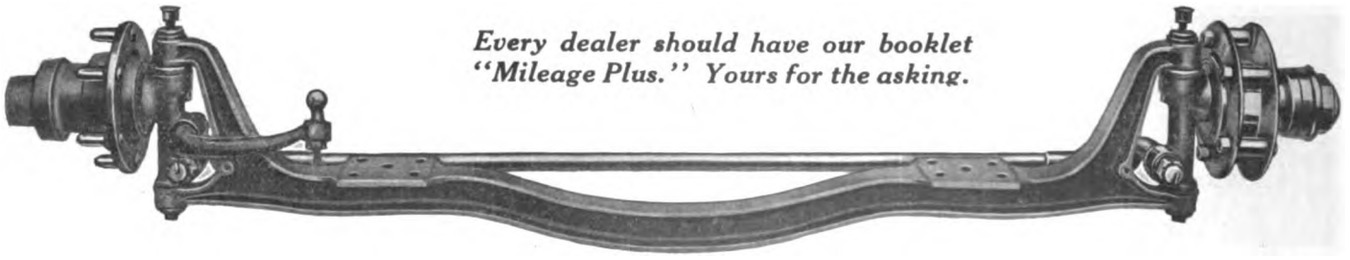
McCUE

IN practically every noteworthy contest of speed and endurance this year, both here and abroad, wire wheels have carried the winners to victory.



As the announcements of new series of cars are published note the increasing number of manufacturers who advertise the adoption of wire wheels as equipment on their improved cars.

It is somewhat far-fetched to assume that wire wheels have any great amount of bearing upon a racing car's speed. Wire wheel superiority is based upon a far more important fundamental than speed.

It is equally absurd to think manufacturers are adopting wire wheels as the result of a fad. They have a real basic reason for doing so.
